SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the
Office of Water Research and Technology
U.S. Department of the Interior

VOLUME 13, NUMBER 9
MAY 1, 1980

W80-03001 – W80-03300

he Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in
e transaction of the public business required by law of this Department. Use of funds for printing this periodical has been
pproved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most our our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographic citation and a set of identifiers or descriptors which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Office of Water Research and Technology.

To provide SWRA with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

The input from these Centers, and from the 54 Water Resources Research Institutes administered under the Water Research and Development Act of 1978, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies becomes the information base from which this journal is derived.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

KUTSE GAME RESERVE: FIELD TRIP TO A DROUGHT-PRONE ENVIRONMENT,
Botswana Ministry of Local Government and Lands, Gaborone.
H. I. D. Vierich, and R. K. Hitchcock.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 21-30, 1979. 4 Fig, 9 Ref.

Descriptors: *Droughts, *Climatology, *Migration patterns, *Botswana, *Wildlife habitats, Paleohydrology, Ecosystems, Environmental effects, Vegetation establishment, History, Kalahari Desert, Kutse Game Reserve, Africa.

The Kutse Game Reserve, covering 2,440 sq. km. in the south-central Kalahari Desert, has been subjected to both long- and short-term climatic alteration. Drought-induced changes occurring in the recent past have formed the Reserve into a good example of a drought-prone environment for several reasons: (1) it is inhabited by migratory wildlife, some of which are well adapted to aridity, (2) vegetation adapted to extremely dry conditions, (3) human populations subsisting by adapting, (4) animals owned by Kutse residents are usually small stock, especially goats adapted to arid conditions, (5) water-stress induced migratory patterns of both hunter-gatherer and pastoral-agricultural Kutse residents can be traced, and (6) Kutse's climatic history is etched in the landscape by fossil river valleys as well as by the vegetational history revealed by huge tree stumps which have been cut or burned. Kutse is an ideal exposition to the investigator of a semiarid ecosystem with a history of climatic, vegetational, and historical change over thousands of years. (Tickes-Arizona)

DESERTIFICATION: NATURAL OR MAN-INDUCED,
Cambridge Univ. (England). Dept. of Geography.
A. T. Grove.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 71-74, 1979.

Descriptors: *Desertification, *Droughts, *Environmental effects, *Biodegradation, Natural resources, Land resources, Conservation, Arid lands, Semiarid climates.

Although the process of desertification has operated in the past, this century is peculiar in the severity of the risks and the extent of regions threatened by this process. The seriousness of the situation varies from country to country within the arid zone, one which occupies about one-third of the earth's land surface, and is greatest in the poorer semiarid lands lacking industries and without oil. It is suggested here that the imbalance among nations underlies and compounds the problems both of drought hazards and of the longer term degradation of semiarid lands. It is concluded that the present order is basically unstable, and liable to be disrupted within a period of much less than a lifetime. Under such circumstances, it is essential over the long term to conserve the natural biological resources of the semiarid lands. (Tickes-Arizona)

THE TRADITIONAL RESPONSE TO DROUGHT IN BOTSWANA,
Botswana Ministry of Local Government and Lands, Gaborone.
R. K. Hitchcock.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 91-97, 1979. 19 Ref.

Descriptors: *Droughts, *History, *Social mobility, *Social values, Climatology, Botswana, Regional analysis.

Ethnohistorical and oral history information is the basis for this description of traditional responses in Botswana to drought, a common, almost characteristic phenomenon in this largely arid country. The many varied responses elucidated here range from mobility to reversion to hunting and gathering and magico-religious ceremonies for inducing rainfall. Although socioeconomic strategies may have been somewhat more effective in coping with drought than their ideological counterparts, it is argued here that strategies such as rain making ceremonies provided people with a sense of security often strongly needed during periods of drought, and represent important mechanisms for alleviating social stress in an unpredictable environment. Traditional drought responses in Botswana, it is further emphasized, cannot be viewed as separate from the political economy of southern Africa. (Tickes-Arizona)

ADJUSTMENT OF PEAK DISCHARGE RATES FOR URBANIZATION,
Hydrologic Engineering Center, Davis, CA. Planning Analysis Branch.
D. L. Gundlach.
Technical Paper No 54, February 1979. 5 p, 3 Fig, 8 Ref, 1 Append.

Descriptors: *Urbanization, *Peak discharge, *Hydrograph analysis, *Urban hydrology, Model studies, Watersheds(Basins), Floods, Surface runoff, Runoff, Storm runoff, Hydrologic aspects, Analytical techniques.

Various investigators have shown that changes from rural to urban conditions within a watershed, in general, significantly affect flood flows. Recorded annual peak discharge rates (or peak discharge rates above a given base) for a basin that has been undergoing a change in land-use conditions represent a nonstationary time series. The series must be adjusted to a specific land-use condition (typically present conditions) prior to performing a statistical frequency analysis. It was the aim of this note to present a procedure utilizing a single event rainfall-runoff model for transforming recorded peak discharges at a gaging station to a consistent set that reflects existing land-use conditions. Methods presented can be used as a guide to determine an existing-condition discharge frequency curve of annual peaks (or peak discharge rates above a given base) when utilizing a single event rainfall-runoff model. The multiplan-ratio option of HEC-1 permits the user to calculate systematically the hydrologic response of several storm events for a given set of land-use conditions. The adjustment procedure described is also applicable when predicting runoff for estimated future conditions. (See also W69-06445, W71-06690, W73-05381, and W75-02119) (Humphreys-ISWS)

DIRECT RUNOFF HYDROGRAPH PARAMETERS VERSUS URBANIZATION,
Hydrologic Engineering Center, Davis, CA. Planning Analysis Branch.
D. L. Gundlach.
Technical Paper No 48, September 1976. 5 p, 2 Fig, 2 Tab, 6 Ref, 1 Append.

Descriptors: *Urbanization, *Urban hydrology, *Hydrograph analysis, *Model studies, Storm runoff, Hydrographs, Unit hydrographs, Floods, Watersheds(Basins), Surface runoff, Analytical techniques, Analysis, Impervious surfaces.

Various rainfall-runoff models are based on the development of unit hydrographs, loss rate functions, and routing criteria. With models of this type, characteristics used to define the unit hydrograph, loss rate, and routing criteria need to be modified to predict runoff that would occur because of future development within a watershed. Certain aspects of this problem, particularly changes in peak flow and lag time due to urbanization, have been treated previously. It was the aim of this note to present additional information regarding the modification of unit hydrograph characteristics due to increased urbanization and to introduce techniques which can be utilized in a practical solution. Relationships presented in this paper can be used as a guide to compute the regional unit hydrograph parameters: TC(the time in hours from the end of effective rainfall to the inflection point on the recession limb of the hydrograph) and R (the ratio in hours of the discharge at the inflection point on the recession limb of the hydrograph to the rate of change of discharge at that point), for existing and predicted values of imperviousness. Modified expressions, such as those developed, are applicable for all values of I (the percentage of impervious surface within a watershed) and the ratio of existing to future impervious surface. (See also W75-01124, W75-02119, and W75-10709) (Humphreys-ISWS)

Field 2—WATER CYCLE

Group 2A—General

Mathematical models, Mathematical studies, Laboratory tests, Hydraulic models, Computer models, Computer programs, Discharge(Water), Hydrologic cycle, Analytical techniques, Routing, Hydraulics, Streamflow, Surface runoff, Overland flow, Flood routing, Kinematic wave model, Dynamic wave model.

This report described the mechanics of surface runoff on a laboratory watershed as simulated by two mathematical models: the dynamic wave model and the kinematic wave model. Each of these two simulation models consists of a pair of one-dimensional spatially varied unsteady flow equations that are derived from the principles of conservation of mass and momentum. In the dynamic wave model, the St. Venant form of both the continuity and momentum equations is used; whereas in the kinematic wave model, only the continuity equation is retained in its differential form and an approximation to the momentum equation is employed. Numerical solution of these quasi-linear partial differential equations describing the flow was attained on computer by adopting an explicit characteristic method. Laboratory flow data were used to verify the validity of the analytical models and to evaluate their applicabilities. For the cases tested, fairly good agreement was found between the computed and measured results with the dynamic wave model being consistently more satisfactory and also less sensitive to the friction factor than the kinematic wave model. The relationships between peak discharges and rainfall intensity, rainfall duration, watershed surface slope, and surface roughness were also investigated by using the dynamic wave model. (Humphreys-ISWS)

2B. Precipitation

SECONDARY PERMEABILITY AS A POSSIBLE FACTOR IN THE ORIGIN OF DEBRIS AVALANCHES ASSOCIATED WITH HEAVY RAINFALL,
Everett and Associates, Rockville, MD.
A. G. Everett.
Journal of Hydrology, Vol 43, No 1/4, p 347-354, October 1979. 1 Fig, 1 Tab, 10 Ref.

Descriptors: *Excessive precipitation, *Rainfall, *Floods, *Landslides, *Debris avalanches, *West Virginia, Precipitation(Atmospheric), Soil water, Permeability, Soil water movement, Erosion, Drainage, Streams, Rivers, Runoff, Mountains, Slopes, Avalanches, Soils, Storm runoff, Secondary permeability.

Throughout much of the Appalachian region, heavy rainfall leads not only to flooding but also to extensive erosion and landsliding. Such a heavy rainfall occurred on August 18, 1972, in southwestern West Virginia with the heaviest rainfall and resultant damage centered over the Gilbert and Bens Creek drainages. Landslides, in the form of debris avalanches, were the principal form of mass movement during the storm. A number of these landslides appear to have resulted from soil zone saturation associated with temporary spring flows issuing from bedrock to the soil mantle where joints in highly fractured shales and coal beds intersected underlying, relatively unjointed, sandstones. Thus, it appears that, in this case, increased pore-water pressures as an effect of concentration of flow through secondary permeability played a substantial role in the localization and formation of slide masses. How widespread this phenomenon may be is not known. (Sims-ISWS)
W80-03048

CORRELATION ANALYSIS OF THE JORDAN VALLEY RAINFALL FIELD,
Hebrew Univ. (Jerusalem). Inst. of Earth Sciences.
D. Sharon.
Monthly Weather Review, Vol 107, No 8, p 1042-1047, August 1979. 6 Fig, 2 Tab, 7 Ref.

Descriptors: *Rainfall disposition, *Depth-area-duration analysis, *Weather patterns, Precipitation(Atmospheric), Distribution patterns, Hydrometeorology, Topography, Jordan Valley, Israel.

A correlation analysis of the Jordan Valley Rainfall Field is presented, based upon spatial correlation function of daily rainfall both within the Valley itself and in relation to the surrounding rainfall field over the central hilly part of Israel and its downward extension deep into northern Jordan. Results derived from data for seven winter seasons between 1960 and 1967 from 92 stations indicate that rainfall patterns causing this region to be an arid enclave within an area receiving up to 700mm of rain annually are independent in terms of timing of rainfall events and their characteristics such as spatial extent, intensity, and duration. This independence, relative to the surrounding uplands, is explained not only in terms of an inverse orographic effect, but also by an increase in local convective activity that may be ascribed to the thermal and dynamic effects of the abrupt valley topography. (Tickes-Arizona)
W80-03056

SOUTHERN AFRICAN RAINFALL: PAST, PRESENT AND FUTURE,
University of the Witwatersrand, Johannesburg (South Africa). Dept. of Geography and Environmental Studies.
P. D. Tyson.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 45-52, 1979. 6 Fig, 7 Ref.

Descriptors: *Weather forecasting, *Rainfall, *Synoptic analysis, Climatology, Depth-area curves, Distribution patterns, Africa.

Except for a restricted area along the south coast, precipitation over Southern Africa is highly seasonal in character and strongly influenced by the position of the subcontinent in relation to the pressure and wind systems of the southern hemisphere. Atmospheric circulation and rainfall patterns are well documented, although how the frequency of occurrence of various synoptic types has varied historically is not known. While no radical one-sided trends can be isolated in South African rainfall, quasi-periodic fluctuations appear to have persisted throughout the period of meteorological record and South Africa as a whole appears not to have undergone a uniform pattern of climatic change. Instead, areas of the country with different seasonal rainfall regions have behaved differently in response to different meteorological mechanisms, producing the rainfall associated with each regime. In the absence of any deterministic models to predict future climatic changes, the likelihood is great that the summer rainfall region of southern Africa, including Botswana, will experience a series of below-normal rainfall years in the 1980s with subsequent periods of extended drought. (Tickes-Arizona)
W80-03061

SOME SOCIOLOGICAL ASPECTS OF DROUGHT,
University Coll. of Botswana, Gaborone. Dept. of Sociology.
K. K. Prah.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society, in collaboration with Clark University Press. p 87-90, 1979. 14 Ref.

Descriptors: *Droughts, *Social adjustment, *Social change, Psychological aspects, History.

Drought inevitably brings a host of sociological problems for which societies have devised a variety of ameliorative measures, depending on their level of development. This brief historical review indicates that while some societies have attacked the problem of drought and aridity more radically than others, it can be concluded that differing historical epochs generally have created sociocultural features enabling men to check and mitigate the effects of aridity and low rainfall. It is suggested that contemporary social problems often arise because of an imbalance developing between these societies and the environments in which they have traditionally existed. (Tickes-Arizona)
W80-03066

2C. Snow, Ice, and Frost

CHARACTERISTICS OF SUBARCTIC SNOWCOVER,
Saskatchewan Univ., Saskatoon. Dept. of Geography.
J. E. Fitzgibbon, and T. Dunne.
Hydrological Sciences Bulletin, Vol 24, No 4, p 465-476, December 1979. 4 Fig, 5 Tab, 11 Ref.

Descriptors: *Snowpacks, *Canada, *Watersheds(Basins), *Vegetation effects, Snowmelt, On-site investigations, Analytical techniques, Water equivalent, Areal, Properties, Data collections, Snow surveys, Vegetation, Variability, Snow cover, Snow management, Forest management, Burning, Subarctic, Distribution patterns, *Schefferville(Quebec), Snowpack properties.

The areal and temporal characteristics of the snowpack in a small subarctic drainage basin at Schefferville, Quebec, were analyzed prior to and during the snowmelt in 1972 and 1973. The data showed that vegetation cover is of prime importance in determing the areal distribution of snowpack properties. The areal distribution of snow water equivalent could be characterized by a normal distribution in each of four vegetation cover types. It was found that the mean and standard deviation of snow water equivalent are closely related to vegetation cover. Also, mean snow water equivalent varies from year to year, but standard deviation shows no significant variation. This suggests that mean accumulation is the result of annual snowfall amounts, while the variability is due to the effects of vegetation cover and accumulation processes. The data also showed that during the snowmelt, the variability of snowcover properties shows no significant change. Using the normal distributions of the peak accumulation snow water equivalents, and observed and calculated melt rates, the areal extent of snowcover was determined. (Humphreys-ISWS)

WINTER ICE JAMS ON THE GUNNISON RIVER,
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
P. H. Burgi.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-131543, Price codes: A03 in paper copy, A01 in microfiche. Report No REC-ERC-79-4, February 1979. 35 p, 26 Fig, 4 Tab, 9 Ref.

Descriptors: *Ice jams, *Colorado River, *Winter, *River flow, Frazil ice, Ice cover, Freezing, Ice loads, Ice breakup, Reservoirs, Water temperature, Climatic data, Weather, Gunnison River, Floods.

The formation, transport, and accumulation of ice on a 14 km stretch of the Gunnison River in Colorado was studied during a six year period. The Gunnison River, a principal tributary of the Colorado River, has an average elevation of 2,300 m above sea level for the area studied. Located along the study area are two reservoirs, the Taylor Park Reservoir which is upriver from the Blue Mesa Reservoir at the lower end of the area. Winter conditions are severe with 3 days in January of 1971 having a maximum temperature of -18 C or below with the lowest temperature being -38 C. Various river channelization, river snagging, and clearing operations have been performed in an attempt to reduce the ice jamming problem. Since 1967 with the filling of the Blue Mesa Reservoir descriptive records have been kept on the winter ice jams. Summaries of these annual descriptions are included. Study results show that the elevation of the Blue Mesa Reservoir at the end of November is a major factor in determining the location of the ice jam head at the start of the season. The higher the reservoir, the further upstream the ice jam starts. Clearing and snagging operations have had little effect on reducing the jamming, howev-

er, the construction of larger ice collection areas has helped. A good correlation was observed between upstream ice jam movement and average temperature below minus 10 C. Large releases from the Taylor Park Reservoir during the winter contribute to the ice formation problem. Data summaries, maps, and photographs are included. (Seigler-IPA)

WORLD DATA CENTER A FOR GLACIOLOGY (SNOW AND ICE), NEW ACCESSIONS LIST NO. 4.
Colorado Univ., Nederland. Inst. of Arctic and Alpine Research.
September 1979. 110 p.

Descriptors: *Glaciology, *Snow, *Ice, *Bibliographies, Computers, Snow cover, Glaciers, Avalanches, Polar regions, Sea ice, Permafrost, Abstracts, Data collections, Publications, Paleoglaciology, Polar ice.

The quarterly list of documents acquired by the Data Center during the period April-June 1979 has been published. Books, technical reports, conference proceedings, and reprints were included; most journal articles have not been indexed. Entries are listed by author and subject. Due to space considerations, however, complete bibliographic information for a document is given only under the author entry. The subject headings are those used by the U.S. Army Cold Regions Research and Engineering Laboratory in their Bibliography on Cold Regions Sciences and Technology. (Preece-ISWS)
W80-03208

2D. Evaporation and Transpiration

A SENSITIVITY ANALYSIS OF THE PENMAN-MONTEITH ACTUAL EVAPOTRANSPIRATION ESTIMATES,
Institute of Hydrology, Wallingford (England).
K. Beven.
Journal of Hydrology, Vol 44, No 3/4, p 169-190, December 1979. 10 Fig, 22 Ref, 2 Append.

Descriptors: *Evapotranspiration, *Model studies, *Hydrology, Data collections, Input-output analysis, Humid climates, Temperate, Canopy, Watersheds(Basins), Equations, *Sensitivity analysis, *Penman-Monteith equation, Systeme hydrologique europeen, Error variance, Humid temperate region, Aerodynamic resistance, Canopy resistance.

A brief description was given of the evapotranspiration component, based on the Penman-Monteith equation, of the distributed Systeme Hydrologique Europeen model of catchment hydrology. The importance of evapotranspiration predictions to the operation of the model was stressed, together with expected error variance associated with estimates of evapotranspiration. The sensitivity of such estimates to errors in input data and estimated model parameter values can be investigated. It was shown that for dry canopy conditions at three sites within a broadly humid temperate region, the sensitivity of Penman-Monteith estimates of evapotranspiration to different input data and parameters is very dependent on the values of the aerodynamic and canopy resistance parameters that introduced the influence of vegetation type into the predictions. For forest surfaces, in particular, the evapotranspiration predictions were highly sensitive to values of the canopy resistance, so that accurate estimation of this parameter was important. (Roberts-ISWS)
W80-03036

2E. Streamflow and Runoff

EFFECTS OF PARAMETER UNCERTAINTY IN A FLOW ROUTING MODEL,
Institute of Hydrology, Wallingford (England).
P. Whitehead, G. Hornberger, and R. Black.
Hydrological Sciences Bulletin, Vol 24, No 4, p 445-464, December 1979. 12 Fig, 25 Ref.

Descriptors: *Routing, *Model studies, *Australia, Runoff, Hydrologic systems, Parametric hydrology, Monte Carlo method, Flow, Hydrology, Flow routing models.

A Monte Carlo simulation approach was used to investigate the effects of parameter uncertainty in a 'nonlinear storage' flow routing model on downstream flow prediction. The analysis was oriented towards a study of the problem of routing the measured discharge hydrograph at Hughes Bridge on the Murray River, Western Australia, to an ungauged point some 36 km downstream, but implications of the results pertain to broader issues of flow routing in inadequately gauged rivers. The downstream flow predictions were insensitive to N, the number of reaches into which the river segment is divided, and, for small perturbations in inflow, were also relatively insensitive to a and b, the travel time parameters. Peak flow predictions, however, depended strongly on the values of a and b, and consequently accurate flood prediction required careful determination of these parameters. The estimate of the 'gain' in discharge at a downstream station due to lateral inflow in the river segment is also subject to considerable uncertainty, and mis-estimates of this parameter can result in poor predictions of downstream flows. (Lee-ISWS)

HYDROLOGIC DATA FOR FLOODS OF JULY 1978 IN SOUTHEAST MINNESOTA AND SOUTHWEST WISCONSIN,
Geological Survey, St. Paul, MN. Water Resources Div.
V. J. Latkovich.
Available from OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225. Microfiche $3.50, printed copy $4.00. Geological Survey, open-file report 79-1166, 1979. 29 p, 18 Fig, 2 Tab.

Descriptors: *Hydrologic data, *Historic floods, *Minnesota, *Wisconsin, *Thunderstorms, Flood profiles, Flood damage, Documentation, Stage-discharge relations, Flood frequency, Sediments, Aerial photography, Current meters, Indirect flood measurement, Gaging stations, Peak discharge, Flood recurrence interval, *Southeast Minnesota, *Southwest Wisconsin.

Intense storms of July 1978 caused floods of historical significance in southeast Minnesota and southwest Wisconsin. Local, State, and Federal officials need data and information to evaluate, coordinate, and manage programs concerned with floods and flood losses. Because of a need to document stream discharges, elevations, and sediment concentrations, current-meter and indirect measurements were made at 34 gaging stations during or immediately after the floods. This report summarizes some of the hydrologic data collected. Peak discharges of record occurred at 20 gaging stations. Frequency of peak discharge equaled or exceeded the 100-year recurrence interval at 11 stations. The Federal Benchmark gaging station on the North Fork Whitewater River was destroyed. Five people died as a result of the floods, and property damages were estimated to exceed $114 million. Thirty-three counties were officially declared disaster areas. (Kosco-USGS)

FLOODS IN PUERTO RICO, MAGNITUDE AND FREQUENCY,
Geological Survey, Tampa, FL. Water Resources Div.; and Geological Survey, Fort Buchanan, PR. Water Resources Div.
M. A. Lopez, E. Colon-Dieppa, and E. D. Cobb.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-300 855, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-141, June 1979. 66 p, 13 Fig, 3 Tab, 59 Ref.

Descriptors: *Floods, *Flood frequency, *Puerto Rico, *Regression analysis, *Regional analysis, Peak discharge, Streamflow, Gaging stations, Watersheds(Basins), Drainage area, Rainfall-runoff relationships, Frequency curves.

Annual-peak discharge records at 50 sites in Puerto Rico with five or more years of record were used to determine individual site log-Pearson type III frequency curves. The frequency curve values for 2-, 10-, 25-, 50-, and 100-year recurrence intervals at 37 sites with 10 or more years of record were regressed against basin characteristics. Drainage area and mean annual rainfall proved to be the only independent variables significant at the 95 percent confidence level in these regression equations. (Woodard-USGS)

UNSTEADY STREAMFLOW MODELING GUIDELINES,
Nevada Univ. System, Reno. Water Resources Center; and Nevada Univ. System, Reno. Dept. of Civil Engineering.
V. L. Gupta, S. M. Afaq, J. W. Fordham, and J. M. Federici.
Journal of Hydrology, Vol 43, No 1/4, p 79-97, October 1979. 14 Fig, 4 Tab, 16 Ref. OWRT A-057-NEV(4), B-096-NEV(1).

Descriptors: *Streamflow, *Floods, *Model studies, *Mathematical models, *Nevada, Rivers, Lakes, Flow, Historic floods, Hydrographs, Synthetic hydrology, Analytical techniques, Mathematics, Hydrology, *Truckee River(NV).

Presented was a case study of one-dimensional modeling of spatially varied unsteady flow regime in a river, utilizing the continuity and momentum formulations of Saint-Venant equations. The emphasis was on sensitivity analyses of the modeling framework for obtaining guidelines for modeling exercises. Finite-difference schemes were compared relative to their efficacy in simulating flow regimes. Model response was examined with respect to changes in six parameters, namely: (1) grid size; (2) lateral inflow or outflow rates; (3) discrete and composite description of hydraulic elements; (4) discrete and composite description of bed slopes; (5) roughness coefficient of stream bed; and (6) magnitude of weighting parameter. HYDRAULIC GEOMETRY AND CARRYING CAPACITY OF FLOODPLAINS,
Illinois State Water Survey, Urbana.
N. G. Bhowmik, and J. B. Stall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-140841, Water Resources Center, University of Illinois, Urbana Research Report No 145, September 1979, 147 p, 120 Fig, 6 Tab, 64 Ref, Append. OWRT B-100-ILL(3), 14-34-0001-7153.

Descriptors: *Floodplains, *Hydraulic geometry, Stream order, Cross-sections, Depth, Width, Carrying capacity, Floods, Humid areas, Streams, Hypsometric analysis, Incision, Flow duration.

Hydraulic geometry relationships for floodplains of nine river basins in Illinois and four river basins outside of the state were developed. Relationships between floodplain width, cross-sectional area, surface area, depth, sinuosity, incision, and stream order have been developed. These hydraulic ge-

ometry parameters were also found to be related to the drainage area of the individual stream segments. Hydraulic geometry coefficients of the floodplains of Illinois streams were found to be similar although the developed relationships have different base values. Hypsometric analyses of the Illinois streams indicated that most of the stream in Illinois are in a mature stage of development. All of the hydraulic geometry parameters of the floodplains increased in the downstream direction. However, for some rivers, the cross-sectional areas showed an increase in the downstream direction up to a certain distance and then it decreased to some extent near the mouth of the river. Comparison of the hydraulic geometry parameters of the floodplains and the main streams indicated that the hydraulic geometry parameters of the floodplains increased at a lower rate in the downstream direction than did the corresponding parameters of the main streams. Actual field data related to the carrying capacity of floodplains were analyzed to determine the distribution of flow in the main channel and in the floodplains. The carrying capacity of floodplains can vary anywhere from a few percent to more than 80 percent of the total flow for the data analyzed for this research.

ESTIMATING MICRO-RELIEF SURFACE STORAGE FROM POINT DATA,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
I. D. Moore, and C. L. Larson.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 5, p 1073-1077, September-October 1979. 2 Fig, 3 Tab, 11 Ref.

Descriptors: *Runoff, *Depression storage, *Soil surfaces, *Model studies, Mathematical models, Surface drainage, Storage, Soils, Infiltration, Depression, Rainfall, Farm management, Agriculture, Agricultural runoff, Micro-relief surface storage.

A distributed model for calculating surface storage and runoff amounts for a plot from grid elevations was developed. The model, which operates independently of rainfall and infiltration rates, was applied to field observations on 16 plots, before and after rainfall application. The results showed that limited runoff occurs concurrently with buildup of micro-relief storage. Percent of area contributing runoff increases by steps. Micro-relief storage was increased 3 to 4 times by plowing, but was substantially reduced by subsequent rainfall. (Sims-ISWS)

A SIMPLIFIED MODEL FOR THE GENERATION OF DAILY STREAMFLOWS,
Lancaster Univ., Bailrigg (England). Dept. of Environmental Sciences.
D. M. Sargent.
Hydrologic Sciences Bulletin, Vol 24, No 4, p 509-527, December 1979. 14 Fig, 5 Tab, 7 Ref.

Descriptors: *Streamflow, *Hydrology, *Streamflow forecasting, Hydrographs, Model studies, Analytical techniques, Hydrologic data, Mathematical models, Flow measurement, Computer models, Statistical methods, River flow, *Streamflow data, *England, Daily flow model.

A technique for generating sequences of daily streamflows was presented which preserves the important characteristics of the daily flow hydrograph by the use of a number of simple processes. The daily flow model was applied, in conjunction with a disaggregation model to preserve statistics of monthly and annual flows, to historic data for a river in the northwest of England. Several sets of synthetic data generated by the model were tested for their acceptability. (Lee-ISWS)

Descriptors: *Flood control, *Systems analysis, *Mississippi, *Model studies, Flood damage, Hydrologic aspects, Economics, Mathematical models, Design, Analytical techniques, Methodology, Channel improvement, Flood protection, Stream improvement, *Tibbee River(MS), Case study.

A hydrologic-economic simulation model was developed to evaluate alternative protection schemes in the design of an authorized federal flood control project for 125 miles of the Tibbee River Flood plain in Mississippi. The model requires input consisting of unit hydrographs, streamflow routing coefficients and storage functions, a pattern storm, rainfall loss rate functions, and flow-damage-frequency relations. A single synthetic pattern storm was used in conjunction with flow-frequency curves at index locations to generate a series of floods for comparing alternative protection schemes with existing conditions. The effect of channel improvements on flood runoff characteristics was evaluated by using storage routing functions that account for changes in storage-discharge relations. Upstream channel improvement works for flood control would tend to increase the magnitude of peak flow rates now experienced on the Tibbee River main stem. They would also tend to increase the average annual flood damages on the main stem unless it was enlarged to accommodate the increased discharges. (Humphreys-ISWS)

THE SIMULATION OF TRANSMISSIVITY, STORATIVITY AND EVAPOTRANSPIRATION IN A DIGITAL MODEL OF A FISSURED DOLOMITE AQUIFER NEAR NDOLA, ZAMBIA,
Institute of Geological Sciences, Wallingford (England).
B. Adams, and R. Kitching.
Hydrological Sciences Bulletin, Vol 24, No 4, p 487-498, December 1979. 9 Fig, 1 Tab, 5 Ref.

Descriptors: *Evapotranspiration, *Simulation analysis, *Transmissivity, Digital computers, Dolomite, Karst, Fissures(Geologic), Aquifers, Rainfall, Calibrations, *Storativity, *Karstic aquifers, *Zambia, Digital model, Fissured dolomite, Dolomite aquifers, Kakontwe dolomite, Field evidence, Soil moisture deficits, Polygonal nodal system.

The application of nonlinear transmissivity and storativity functions in a digital groundwater model of a fissured dolomite near Ndola, Zambia, was described. A digital model calibration problem was solved by using methods based on a knowledge of field conditions. The transmissivity and storativity functions were adequate to model the third spatial coordinate in what was essentially a two-dimensional (in space) mathematical solution to a natural phenomenon, i.e., groundwater flow through a karstic aquifer. These functions were based on an understanding of the behavior of karstic aquifers and evidence from borehole logs within the area. The use of root constants and of the facility of modeling soil moisture deficits, and hence actual evapotranspiration, was also a logical and justifiable technique for the construction of digital models of aquifer systems. GROUNDWATER: NEW DIRECTIONS--WHERE WE'VE BEEN AND WHERE WE'RE GOING,
R. G. Kazmann.
Journal of Hydrology, Vol 43, No 1/4, p 555-569, October 1979. 10 Ref.

Descriptors: *Groundwater, *Research and development, *Aquifer management, *United States, Hydrogeology, History, Documentation, Publications, Groundwater resources, Brine disposal, Waste disposal, Water storage, Hydraulics, Saline water intrusion, Model studies, Underground storage, Natural gas storage, Heat storage.

During Burke Maxey's lifetime the potentiometric analysis of groundwater problems, pioneered by Theis, was completely worked out by theoreticians. Such 'macro-methods' are now taught in universities and are widely used. In the future they will be supplemented by 'micro-methods' that are site specific and best described as involving miscible displacement: a well-known application is the leach mining of copper or uranium. Saline aquifers are already used for the storage of natural gas and as permanent containments for liquid wastes.

Future uses of such aquifers will include storage of freshwater and, possibly more important, storage of hot water (water that has been heated by waste heat from generating plants or industrial plants) for later retrieval and use in space heating and other applications of low-grade heat. All of these possibilities offer unexplored fields of research to the imaginative and innovative investigator. All of these possibilities offer an unexcelled opportunity for failure. The era of the use of miscible displacement in porous media is just beginning. (Humphreys-ISWS)

DEPRESSURIZATION OF A MULTI-LAYERED ARTESIAN SYSTEM FOR WATER AND GROUT CONTROL DURING DEEP MINE-SHAFT DEVELOPMENT,
Dames and Moore, Phoenix, AZ.
W. M. Greenslade, and G. W. Condrat.
Journal of Hydrology, Vol 43, No 1/4, p 517-536, October 1979. 4 Fig, 7 Tab, 5 Ref.

Descriptors: *Mining, *Mine water, *Dewatering, *New Mexico, Pumping, Drawdown, Aquifers, Artesian aquifers, Groundwater, Groundwater movement, Velocity, Pressure, Geology, On-site investigations, Hydrology, Depressurization, Mine shafts, Uranium mining.

Uranium in the Grants Mineral Belt of northwestern New Mexico is explored from progressively greater depths. As mining depths increase, more aquifers and higher hydrostatic heads are encountered. Water control during mine shaft sinking is critical to successful shaft development. Field testing procedures were designed to produce data on aquifer coefficients, groutability, and rock strength appropriate to the short-term construction period involved in shaft sinking. Design coefficients were selected on the basis of field and laboratory test results and regional geohydrology. The uranium ore is located between 915 and 1220 m (3000 and 4000 ft) below the surface. The geology of the area studied comprises alternating marine and nonmarine sandstone, siltstone, and shale. The ore is located in the lowermost of six major aquifers identified. A depressurizing system was designed to reduce the hydrostatic pressure and shaft water inflow from each of the aquifers. The groundwater velocity across the shaft was maintained below 0.61 m/day (2 ft/day) and minimized movement of grout away from the shaft. (Sims-ISWS)

Just as in the case of hydrogeology and petroleum engineering, well testing is an invaluable tool in assessing the resource deliverability of geothermal reservoirs. While the techniques of production testing and interference testing already developed in hydrogeology and petroleum engineering provide a strong foundation for geothermal well testing, the latter is challenged by some special problems. These special problems stem primarily from the difficulties associated with the measurement of mass flow rate, pressure, and temperature under the hostile environment prevalent within geothermal wells. This paper briefly looked into the state of the art of geothermal well testing and provided a few illustrative field examples. (Sims-ISWS)

SIMULATED CHANGES IN POTENTIOMETRIC LEVELS RESULTING FROM GROUNDWATER DEVELOPMENT FOR PHOSPHATE MINES, WEST-CENTRAL FLORIDA,
Geological Survey, Tampa, FL.
W. E. Wilson, and J. M. Gerhart.
Journal of Hydrology, Vol 43, No 1/4, p 491-515, October 1979. 13 Fig, 1 Tab, 10 Ref.

Descriptors: *Potentiometric level, *Computer models, *Florida, *Pumping, *Phosphates, *Mining, Transmissivity, Storage coefficient, Hydraulic conductivity, Water table, Steady flow, Unsteady flow, Model studies, Aquifers, Water yield, Floridan aquifer.

A digital model of two-dimensional groundwater flow was used to predict changes in the potentiometric surface of the Floridan aquifer resulting from groundwater development for proposed and existing phosphate mines during 1976-2000. The modeled area covers 15,379 sq km in west-central Florida. In 1975, groundwater withdrawn from the Floridan aquifer for irrigation, phosphate mines, other industries, and municipal supplies averaged about 28,500 l/s. Withdrawals for phosphate mines are expected to shift from Polk County to adjacent counties to the south and west, and to decline from about 7,620 l/s in 1975 to about 7,060 l/s in 2000. The model was calibrated under steady-state and transient conditions. Input parameters included aquifer transmissivity and storage coefficient; thickness, vertical hydraulic conductivity, and storage coefficient of the upper confining bed; altitudes of the water table and potentiometric surface; and groundwater withdrawals. Simulation of November 1976 to October 2000, using projected combined pumping rates for existing and proposed phosphate mines, resulted in a rise in the potentiometric surface of about 6 m in Polk County, and a decline of about 4 m in parts of Manatee and Hardee counties. SEASONAL CHEMICAL AND ISOTOPIC VARIATIONS OF SOIL CO2 AT TROUT CREEK, ONTARIO,
Waterloo Univ. (Ontario). Dept. of Earth Sciences.
E. J. Reardon, G. B. Allison, and P. Fritz.
Journal of Hydrology, Vol 43, No 1/4, p 355-371, October 1979. 9 Fig, 22 Ref.

Descriptors: *Soil gases, *Carbon dioxide, *Isotope studies, *Groundwater, Soil water, Soils, Water levels, Sampling, On-site investigations, Data processing, Analytical techniques, Precipitation(Atmospheric), Soil moisture, Water chemistry, Soil carbon dioxide.

The partial pressure of carbon dioxide in soil gas and its 13C isotopic composition were monitored in a sandy calcareous soil during 1977-1978. These measurements were coupled with chemical and isotopic analyses of groundwater from a water-table piezometer. The 13C isotopic composition of the groundwater at the water table is in apparent equilibrium with the soil zone CO2 gas phase. The P sub CO2 is primarily controlled by root respiration, diffusive loss to the atmosphere, and uptake by the aqueous phase. Steep P sub CO2 gradients towards the water table are evident during periods of low CO2 production in the root zone. By early spring, diffusive loss of CO2 along these gradients extends to depths of 7 m or more. During the growing season this gradient is reversed, resulting in CO2 buildup below the root zone. Below a depth of 7 m, soil CO2 content showed little seasonal change. Leaching of soil carbonate extends to depths of 2 m or more in the study area. A rapid neutralization of slightly acid soil water by soil carbonate as the water is displaced across the leached-unleached zone boundary due to recharge events is believed to account for the deposition of iron and manganese oxides at this interface. Saturation of soil water with respect to calcite is attained in the unsaturated zone, and a state of supersaturation is reached by the time the soil water reaches the water table. Two mechanisms may account for this supersaturation: (1) slow dissolution of dolomite by infiltrating soil water after calcite saturation is reached; and (2) CO2 degassing of soil water in response to CO2 losses from the soil profile during fall and winter. (Sims-ISWS)

EVALUATION TECHNIQUES OF FRACTURED-ROCK HYDROLOGY,
H. E. LeGrand.
Journal of Hydrology, Vol 43, No 1/4, p 333-346, October 1979. 4 Fig, 5 Ref.

Descriptors: *Groundwater, *Fractures(Geologic), *Fracture permeability, *Southeast U.S., Rocks, Groundwater movement, Permeability, Geology, Evaluation, Porous media, Hydrogeology, Areal hydrogeology, Hydrology.

Areas in which fractured rocks are part of the hydrologic circulatory system are widespread. Certain aspects of the historical features of hydrology tend to influence fractured rocks, and the results of these influences in turn control certain aspects of applied hydrology. The dynamic changes in the fractured-rock system can be cast in spatial relations that are usefully studied in the field and in the context of their historical development. For example, circulating water in carbonate rocks causes enlargement of fractures by solution and the development of secondary permeability that further influences movement and storage of water; solutes moving in fractures of less soluble rocks control the degree of development of overlying insoluble residue, and to the degree present, this residue forms another type of sub-surface water medium that must be considered with the fractured-rock system. The treatment of fracture systems of consolidated rocks in a way similar to porous granular media, in a context of fractures analogous to pores strictly a matter of scale, is not an adequate base for analyzing problems of fractured-rock hydrology. A key problem is the uneven distribution of permeability, a condition resulting from geologic and hydrologic processes since consolidation of the rock. Classifying the patterns of uneven distribution lead to appropriate models on which useful mean values and devi-

ations can be described. Reconstruction of the hydrogeologic history of a fractured-rock system provides an elegant foundation for the evaluation of the existing hydrology. (Sims-ISWS)

REGIONAL CARBONATE FLOW SYSTEMS IN NEVADA,
Nevada Univ. System, Las Vegas. Water Resources Center.
M. D. Mifflin, and J. W. Hess.
Journal of Hydrology, Vol 43, No 1/4, p 217-237, October 1979. 4 Fig, 3 Tab, 42 Ref.

Descriptors: *Groundwater, *Aquifers, *Carbonate rocks, *Nevada, *Great Basin, Water supply, Water resources, Geology, Stratigraphy, Permeability, Caves, Wells, Springs, Bedrock, Groundwater movement, Water chemistry, Dissolved solids, Tritium, Hydrology, Hydrogeology.

Carbonate rocks include some of the most extensive and productive aquifers in the world. In Nevada, the limited surface water supply has been extensively developed, and most of the alluvial groundwater basins are used to the point of estimated perennial yield, thus are closed to further development. Based on the review of over 570 geologic/hydrologic references, 150 petroleum wildcat test-hole records, and cave and carbonate spring data, it is believed that deep regional carbonate aquifers exist and that they are potentially favorable for development for water supplies. Approximately the eastern one-third of Nevada (105,000 sq km) is underlain by carbonate rock. Eastern Nevada lies within the miogeosynclinal belt of the cordilleran geosyncline, in which 9,000-12,000 m of marine sediments accumulated during the Precambrian and Paleozoic. Two major periods of deformation have affected the region. Cave, wildcat well, and carbonate spring data indicate that the Cambrian and Devonian carbonate strata may generally have the highest permeability. Water quality at depth in general ranges between 300 and 600 mg/l TDS. A 'Phase II' project has been designed to further these investigations and will increase our understanding of large regional carbonate aquifers in the Great Basin. (Sims-ISWS)

UTILITY OF A COMPUTERIZED DATA BASE FOR HYDROGEOLOGIC INVESTIGATIONS, LAS VEGAS VALLEY, NEVADA,
Office of Radiation Programs, Las Vegas, NV.
R. F. Kaufmann, and H. N. Friesen.
Journal of Hydrology, Vol 43, No 1/4, p 195-216, October 1979. 8 Fig, 1 Tab, 13 Ref, EPA R800946.

Descriptors: *Groundwater, *Data collections, *Data storage and retrieval, *Nevada, Stratigraphy, Permeability, Transmissivity, Water quality, Water balance, Wells, Water wells, Well data, Water levels, Pumping, Drawdown, Storage, Data processing, Computers, Hydrology, Hydrogeology, *Las Vegas(NV).

Hydrogeologic study of the shallow groundwater zone in Las Vegas Valley, Nevada, involved development of an extensive computerized data base consisting of water analyses and water-well logs. The data were manipulated and reduced using a variety of graphical and statistical techniques applicable to analysis of spatial and temporal changes in water quality. Stratigraphic relations, permeability/transmissivity variations, water budgets, and ambient quality relative to drinking-water standards were evaluated as part of an overall EPA funded study to determine the sources and extent of groundwater contamination and develop management alternatives to minimize adverse effects. Extension of the data base to include investigations concerned with improved definition of the stratigraphic and structural makeup of the valley and to applied study of water quality, subsidence, and water banking seems reasonable. (Sims-ISWS)

MEASUREMENT OF FLUID VELOCITY USING TEMPERATURE PROFILES: EXPERIMENTAL VERIFICATION,
Illinois State Geological Survey, Urbana.
K. Cartwright.
Journal of Hydrology, Vol 43, No 1/4, p 185-194, October 1979. 5 Fig, 12 Ref.

Descriptors: *Groundwater movement, *Velocity, *Water temperature, *Illinois, Wells, Water wells, Groundwater, On-site investigations, Test wells, Geology, Aquifers, Heat, Heat transfer, Temperature, Hydraulic conductivities, Hydrology, Temperature profiles.

Temperature profiling has been used to predict the rate and direction of groundwater movement. A controlled field experiment was conducted to ascertain the validity of the rate calculations made using this method. The vertical velocity, or leakage, of groundwater between two aquifers was calculated utilizing both hydrologic and temperature measurements in a well drilled into the Paw Paw buried bedrock valley in northern Illinois. The experiment showed that accurate estimates of leakage can be made in stable boreholes where there are no geologic complications. Estimates utilizing temperature and hydrologic methods produced similar results for one of two aquicludes. However, the methods produced dissimilar results for the second aquiclude. It was speculated that the presence of a thin organic silt caused most of the problem; other complicating factors were lithologic variation and a very low hydraulic gradient. Nevertheless, the method appears to have great promise in many geologic environments. (Sims-ISWS)

PROGRESS IN ANALYTICAL GROUNDWATER MODELING,
Upper Mississippi River Basin Commission, Twin Cities, MN.
W. C. Walton.
Journal of Hydrology, Vol 43, No 1/4, p 149-159, October 1979. 4 Tab, 47 Ref.

Descriptors: *Mathematical models, *Groundwater, *Analytical techniques, *Reviews, Model studies, Wells, Water wells, Groundwater movement, Aquifers, Artesian aquifers, Injection wells, Hydrology.

Analytical models simulating the flow of groundwater to and from wells and streams, land subsidence due to artesian pressure decline, conservative solute transport to and from wells, and heat transport to and from wells have been developed for many aquifer systems, well and stream conditions. These models are useful, though limited in application, for aquifer-test analysis, simple aquifer system evaluation, and numerical computer model design and calibration. Accelerated progress in analytical model development and application is called for particularly regarding flow in leaky artesian aquifers, conservative and nonconservative solute transport and transfer, and heat transport. THE MEINZER ERA OF U.S. HYDROGEOLOGY, 1910-1940,
Nevada Univ. System, Reno. Desert Research Inst.
G. B. Maxey.
Journal of Hydrology, Vol 43, No 1/4, p 1-6, October 1979. 10 Ref.

Descriptors: *Hydrogeology, *United States, *History, *Groundwater, Documentation, Publications, Analytical techniques, Groundwater movement, Hydrologic budget, Groundwater resources, Meinzer era.

Acceleration of agricultural, industrial, and municipal development following the American Civil War resulted in unprecedented demands for knowledge of movement, occurrence, quality, and availability of groundwater. By 1910, response to this demand resulted, in government, in establishment of specialized agencies. The agency most affecting development of hydrogeology was the Ground Water Division of the U.S. Geological Surve, especially after appointment of O.E. Meinzer as Chief in 1912. The Division established a system utilizing geologists and engineers (later other scientists) working as teams to assess groundwater resources. The U.S. Geological Survey developed cooperative programs allowing State Engineers and geologists to participate in resource studies, an effective way of encouraging interest in hydrogeological problems as well as establishing a strong funding base. By 1940, resource evaluation studies numbered into the hundreds and, more important, a sound scientific and engineering basis for hydrogeology was established. Contributions were made by scientists in the petroleum industry chiefly in movement of fluids through porous media (works of M. Muskat and M.K. Hubbert and associates). Also C.F. Tolman and associates made contributions in special areas (water supply, saltwater intrusion, land subsidence). By 1940, qualitative hydrology was well developed and documented, and a firm base for quantitative work was established. Contributions were made to specialized studies including budget methods, subsidence, saltwater intrusion, pumping effects, model development, and water quality. Printed summations of the 'state of the art' in 1940 include O.E. Meinzer in Physics of the Earth (1942) and Tolman's Groundwater of 1937. (Humphreys-ISWS)

GROUNDWATER FLOW SYSTEMS IN THE WESTERN PHOSPHATE FIELD IN IDAHO,
Idaho Univ., Moscow. Mining and Mineral Resources Research Inst.
D. R. Ralston, and R. E. Williams.
Journal of Hydrology, Vol 43, No 1/4, p 239-264, October 1979. 13 Fig, 3 Tab, 6 Ref.

Descriptors: *Groundwater, *Hydrogeology, *Phosphates, *Mining, *Idaho, Geology, Groundwater flow, Baseflow, Springs, *Subsurface drainage, Discharge(Water), Water quality, Mine wastes, Phosphorus, Phosphorus compounds, Aquifers, Hydrology, *Blackfoot River Basin(ID).

The complex geologic setting of the western phosphate field in Idaho provides the environment for equally complex groundwater flow systems. This research was initiated in 1974 to provide general and detailed hydrologic data on specific areas to aid in understanding the water-resource systems in the western phosphate field. Geologic, hydrogeologic, and hydrologic data were collected in Little Long Valley and Lower Dry Valley in the Blackfoot River Basin. Two groundwater flow systems are important in relation to the present and proposed mining in Little Long Valley: (1) the local shallow flow systems in the western ridge; and (2) the intermediate flow system in the Dinwoody Formation on the eastern ridge. The baseflow of Angus Creek in Little Long Valley is dependent on the groundwater flow systems in both ridges during the first one or two months following snowmelt. The baseflow of the stream is almost completely dependent on the intermediate flow system in the eastern ridge for the rest of the year. Care must be taken to avoid creating groundwater flow systems in any waste piles constructed as part of the mining activity. Drainage from a waste-pile flow system would probably be poorer quality than water from natural flow systems in the area. (Sims-ISWS)

POTENTIOMETRIC SURFACE OF THE MISSISSIPPIAN AQUIFER IN PARTS OF TRIGG, LYON, CALDWELL, AND CHRISTIAN COUNTIES, MISSISSIPPIAN PLATEAU REGION, KENTUCKY,
Geological Survey, Paducah, KY. Water Resources Div.
R. O. Plebuch.
Geological Survey Water-Resources Investigations 78-25 (open-file report), 1978. 3 Sheets, 17 Ref.

Descriptors: *Potentiometric level, *Kentucky, *Maps, *Contours, *Groundwater movement, Karst, Drilling, Depth, Bedrock, Sandstones, Limestones, Domestic water, Livestock, Water pollution, Water quality, *Mississippian Plateau Region(KY), Mississippian aquifer(KY), Cumberland River basin(KY), Lake Barkley(KY).

Ground-water levels in a 600 square mile area of the Cumberland River drainage basin in parts of Trigg, Lyon Caldwell, and Christian Counties, Mississippian Plateau Region, Kentucky are shown by means of contours on the potentiometric surface. Generaly, ground water moves toward and with the surface drainage to Lake Barkley and the Cumberland River. The potentiometric map indicates a minimum drilling depth to water. The bedrock is composed largely of sandstone, cavernous limestone, or jointed and fractured limestone. All of these rock types yield sufficient water for domestic and stock purposes. The cavernous limestone is extremely vulnerable to pollution. (Kosco-USGS)

AVAILABILITY AND QUALITY OF WATER FROM SHALLOW AQUIFERS IN DUVAL COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
L. V. Causey, and G. G. Phelps.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A075 819, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-92, 1978. 36 p, 11 Fig, 7 Tab, 20 Ref.

Descriptors: *Groundwater availability, *Water quality, *Aquifer systems, *Florida, *Aquifer characteristics, Hydrogeology, Groundwater recharge, Analytical techniques, Aquifer testing, Sites, Water yield, Transmissivity, Petrology, Domestic water, Industrial water, *Floridan aquifer, *Duval County(Fla), *Jacksonville(Fla).

The shallow-aquifer system in Duval County, Fla., overlies the Florida aquifer and is composed chiefly of sand, clay, sandy clay, and limestone. Thickness of the system ranges from about 300 to 600 feet. The upper 150 feet of deposits, consisting of the water-table and shallow-rock zones, are the most dependable and economical source of supplemental water supply. The principal shallow water-bearing zone is a limestone bed 40 to 100 feet below land surface. Aquifer tests conducted at 13 sites in Duval County show that yields from the shallow aquifer vary from place to place within the county owing chiefly to variations in lithology of the saturated rocks and sediments. The limestone of the shallow-rock zone will yield as much as 200 gallons per minute to wells; the maximum yield at most of the sites tested was between 30 and 100 gallons per minute. The water-table zone generally yields 10 gallons per minute or less but at one site, where a water-table well tapped a shell bed near land surface, the well yielded more than 40 gallons per minute. The quality of water in the shallow aquifer system in Duval County is generally acceptable for most domestic, commercial, and industrial uses. In some places, however, it has a high iron concentration and is hard. The iron concentration exceeds 0.3 milligrams per liter in water from the water-table or shallow-rock zones at 7 of the 13 aquifer test sites. The hardness of water from the aquifer ranges from about 60 to about 180 milligrams per liter. (Kosco-USGS)

GROUND-WATER TRACERS--A SHORT REVIEW,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
S. N. Davis, G. M. Thompson, H. E. W. Bentley, and G. Stiles.
Ground Water, Vol 18, No 1, p 14-23, January-February 1980. 1 Fig, 3 Tab, 39 Ref.

Descriptors: *Groundwater, *Groundwater movement, *Tracers, *Reviews, Suspended solids, Spores, Bacteria, Dyes, Dye releases, Water temperature, Chemicals, Stable isotopes, Radioisotopes, Gases, Hydraulic conductivity, Hydrology, Fluorocarbons.

Tracers are used widely to determine the direction and velocity of groundwater movement. Failures of tracer tests are most commonly a result of incorrect choice of tracers, insufficient concentrations of tracers, and a lack of an understanding of the hydrogeologic system being tested. Some of the most useful general tracers are bromide, chloride, rhodamine WT, and various fluorocarbons. For certain purposes, dyed club-moss spores and baker's yeast have proved valuable. Many radionuclides including 3H, 82Br, and 198Au are almost ideal for numerous purposes, but radiation hazards associated with their use together with local, State, and Federal regulations have discouraged widespread field applications in recent years within the United States. (Sims-ISWS)

GRAVITY SURVEY OF A DEEP BURIED VALLEY,
South Florida Univ., Tampa. Dept. of Geology.
M. T. Stewart.
Ground Water, Vol 18, No 1, p 24-30, January-February 1980. 9 Fig, 1 Tab, 17 Ref.

Descriptors: *Gravity studies, *Groundwater, *Aquifers, Sands, Gravels, Bedrock, Geology, Data collections, On-site investigations, Data processing, Well data, Water wells, Water resources, Hydrology, *Outagamie County(WI).

A gravity survey was conducted as part of a groundwater investigation covering 400 sq mi (1,000 sq km) in Outagamie County, northeastern Wisconsin. The objective of the gravity survey was to supplement bedrock topography data obtained from well logs and seismic refraction profiles. The gravity method was chosen as it is a rapid and low cost reconnaissance technique, and conditions in the study area were favorable for a successful gravimetric survey. The simple Bouguer gravity values were referenced to a local base station as only relative gravity values were required. The data were interpolated to a regular grid by an inverse-distance weighted average algorithm. The gravity residual was derived using a five-ring inverse weighted filtering routine. The residual map accurately reflects the major topographic features of the bedrock surface. A two-dimensional geologic model fitted to the residual data agrees well with the simple flat plate approximation used to obtain quantitative estimates of glacial drift thickness. Estimates of drift thickness from the gravity data also agree wellwith bedrock depths obtained from well logs. The most productive drift aquifers are restricted to the major bedrock valleys. Gravity data were coupled with seismic refraction and well data to produce a bedrock elevation map, from which it is possible to predict the extent and distribution of the major drift aquifers. POTENTIAL USE OF DIGITAL COMPUTER GROUND WATER MODELS,
Hydrologic Engineering Center, Davis, CA. Planning Analysis Branch.
D. L. Gundlach.
Technical Paper No 52, April 1978. 34 p, 3 Fig, 1 Tab, 20 Ref.

Descriptors: *Model studies, *Groundwater, *Aquifers, *Systems analysis, *New Mexico, Computer models, Water quality, Mathematical models, Costs, Groundwater movement, Aquifer systems, Aquifer characteristics, Hydraulic conductivity, Groundwater recharge, Flow system, *Albuquerque(NM), Two-dimensional model, Three-dimensional model.

The discussion on the potential use of digital computer groundwater models was prepared for the Albuquerque District, Corps of Engineers, Albuquerque, New Mexico, as part of a water supply study of the Albuquerque Greater Urban Area (AGUA). Although the material presented was developed for the Albuquerque area, the concepts are applicable to the understanding of groundwater modeling generally. The discussion included both quantity and quality models and reasons why an agency may wish to undertake a modeling effort. Available computer programs were cited, and the probable advantages and disadvantages of specific programs were given. Costs for prior modeling efforts of groundwater systems in other localities were also included as a guide to probable costs when considering the use of a digital computer groundwater model. LANDSLIDE-PRONE SOILS OF SOUTHWESTERN PENNSYLVANIA,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
E. J. Ciolkosz, G. W. Petersen, and R. L. Cunningham.
Soil Science, Vol 128, No 6, p 348-352, December 1979. 4 Fig, 2 Tab, 25 Ref.

Descriptors: *Landslides, *Expansive clays, *Regression analysis, *Pennsylvania, *Soil profiles, *Ohio, *West Virginia, *Kentucky, Statistical methods, Wetting, Drying, Soil analysis, Slow flowage, Sliding, Slickensides, Clay content.

Upshur, Vandergrift, Guernsey, and Library soils are found in southwestern Pennsylvania and in Ohio, West Virginia, and Kentucky. These soils have high clay contents, high COLE values, and

slickensides, and are landslide-prone. The movement caused by the wetting and drying of expandable clays, combined with gravitational forces, initiates the downslope soil movement and the formation of slickensides. Cavode and Wharton soils also have high clay contents, but they are not landslide-prone. The clay mineralogy of the landslide-prone soils is of an expandable type, and that of the cavode and Wharton is primarily nonexpandable. Thus the landscape instability of the landslide-prone soils is a function of high clay content, with a high proportion of the clay being of an expandable type. (Visocky-ISWS)

A THEORY OF THE MEAN FLOW DRIVEN BY LONG INTERNAL WAVES IN A ROTATING BASIN, WITH APPLICATION TO LAKE KINNERET,
Woods Hole Oceanographic Institution, MA. Joint Program in Physical Oceanography.
H. W. Ou, and J. R. Bennett.
Journal of Physical Oceanography, Vol 9, No 6, p 1112-1125, November 1979. 12 Fig, 9 Ref, BNL 357213-S,NOAA 03-022-57, NSF OCE76-01813.

Descriptors: *Lakes, *Water circulation, *Internal waves, *Model studies, Theoretical analysis, Mathematical models, Thermocline, Winds, Temperature, Water temperature, Limnology, *Lake Kinneret(Israel), Kelvin waves.

The rectified flow induced by wind-driven internal seiches in a rotating lake was studied. Friction and nonlinearity combine to generate a secondary mean flow which was calculated analytically for the case of a uniform depth lake and numerically for variable depth. The theory was applied to Lake Kinneret, the former Sea of Galilee, where the diurnal wind forcing produces a large internal Kelvin wave and which has a strong cyclonic mean flow. The uniform depth model reproduces the diurnal response adequately, but variable depth is required to reproduce the mean flow. (Sims-ISWS)

DEVELOPMENT OF GENERALIZED FREE SURFACE FLOW MODELS USING FINITE ELEMENT TECHNIQUES,
Hydrologic Engineering Center, Davis, CA.
D. M. Gee, and R. C. MacArthur.
Technical Paper No 53, July 1978. 18 p, 12 Fig, 4 Tab, 14 Ref.

Descriptors: *Mathematical models, *Finite element analysis, *Free surfaces, Hydrodynamics, Model studies, Equations, Flow, Analytical techniques, Analysis, Velocity, Reservoirs, Distribution patterns, Open channel flow, Continuity equation, Momentum equation.

Two finite element hydrodynamic models, one for two-dimensional free surface flow in the horizontal plane and one for the vertical plane, are being evaluated. This paper presented recent results of evaluation and application of the models. The work to date with the horizontal flow model indicates the following: (1) Internal continuity errors can be reduced to acceptable levels by increasing network detail, particularly in areas of large curvature of the velocity field. (2) Errors in continuity tend to be reflected more strongly in the velocity than the depth. (3) General application of the model to steady state simulations is feasible at present. The preliminary work with the vertical flow models indicates the following: (1) The finite element method model is less costly than the finite difference model for steady state solutions. (2) Simulation of flows in which density gradients are important requires careful selection of turbulent exchange and eddy diffusion coefficients. (3) The finite element model predicts larger vertical velocities than the finite difference model, perhaps due to the retention of the vertical momentum equation. (4) More experience with, and development of, the vertical models will be required before 'production' applications can be easily made. Indicated areas of further work are: (1) Verification of models' performance when an adequate data set becomes available. (2) Development of guidance on selection of turbulent exchange coefficients, relationship to flow properties, etc. (3) Investigation of models' behavior for dynamic simulations. (4) Evaluation of use of stagnation vs. slip boundary conditions in the finite element models. (5) Extension of simulations with the vertical models to variable breadth problems. (Humphreys-ISWS)

2I. Water In Plants

FOREST OVERSTORY VEGETATION AND ENVIRONMENT ON THE MISSOURI RIVER FLOODPLAIN IN NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Botany.
W. C. Johnson, R. L. Burgess, and W. R. Keammerer.
Ecological Monographs, Vol 46, No 1, p 59-84, Winter, 1976. 11 Fig, 8 Tab, 82 Ref. OWRT A-022-NDAK(4).

Descriptors: *Missouri River, *Flood plains, *Forests, *Trees, *Ecology, Rooted aquatic plants, Wetlands, Rivers, Ecological distribution, Succession, Meanders, Soils, Floods, Nutrients, Reservoirs.

Structure and composition of forest overstory are strongly related to stand age and position on the floodplain. Populus deltoides and Salix amygdaloides predominate in young stands which generally occur on low terraces near the center of the floodplain. Fraxinus pennsylvanica var. lanceolata, Acer negundo, Ulmus americana and Quercus macrocarpa replace Populus and Salix through time and predominate in old stands on high terraces near the edge of the floodplain. The soils of young stands are generally sandy and low in organic matter. Soil nutrient content and available water capacity are generally higher in older stands because of higher organic matter content and repeated inputs of nutrient-rich silts from past floods. Tree species diversity initially increases as stands age and reaches a maximum in stands with mixtures of both pioneer and terminal species. Variety and evenness follow a similar pattern. A recent decline in the establishment of small stems of Acer and Ulmus, a decline in the diameter growth rate for Acer, Ulmus and Fraxinus and a lack of seedling sapling stands of Populus in the region appear to be the result of the presence and operation of reservoirs. (Stihler-Mass)

2J. Erosion and Sedimentation

WILLAMETTE RIVER SEDIMENT MANAGEMENT POSSIBILITIES: PHASE I -- PROBLEM CLARIFICATION,
Oregon State Univ., Corvallis. Water Resources Research Inst.
P. C. Klingeman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139611, Price codes: A03 in paper copy, A01 in microfiche. Project Completion Report, October 1979. 18 p, 8 Ref, 2 Append. OWRT A-999-ORE(24).

Descriptors: *Oregon, *Sediment control, *Information exchange, *River flow, Documentation, Banks, Riparian land, Aggregates, Gravels, Water management(Applied), Project planning, Fisheries, Sediment transport, Sediment distribution, Erosion.

Descriptive materials developed as a part of an information dissemination project on sediment management for the Willamette River in Oregon are presented. Much conflict over the management of the river, its water, bed, and banks has existed for several years. Groups interested in the river include the construction aggregate industry, fishery agencies, recreation groups, and land owners. However, little factual quantitative information on sediment transport and erosion existed so a project was organized to: (1) clarify the sediment transport regime of the river; (2) identify and prioritize the quantitative information required for decisionmaking; and (3) demonstrate what can be done with various kinds of information to improve the basis for decisionmaking. Project activities designed to assemble and disseminate information included workshops, conferences, and news coverage. A copy of a talk, 'Willamette River Challenges', used at a conference is given. In the talk the physical processes shaping the river and the dynamic nature of the processes are discussed. River management approaches and tasks are identified and challenged. Also presented is a composite of presentations made to technical or industrial groups. This document 'Willamette River Gravel -- Resource Management Needs' is more technical than the first and includes specific action recommendations. (Seigler-IPA)

IMPACTS OF OFF-ROAD VEHICLES ON INFILTRATION AND SEDIMENT PRODUCTION OF TWO DESERT SOILS,
Nevada Univ. System, Reno. Renewable Natural Resources Div.
R. E. Eckert, Jr., M. K. Wood, W. H. Blackburn, and F. F. Peterson.
Journal of Range Management, Vol 32, No 5, p 394-397, Sept 1979, 2 Fig, 2 Tab, 19 Ref.

Descriptors: *Environmental effects, *Desert soils, *Off-road vehicles, *Soil mechanics, *Soil manage-

ment, Recreation, Soil stabilization, Simulated rainfall, Nevada, Infiltration rates, Sedimentation rates.

Although scientists generally agree that off-road vehicle (ORV) traffic is damaging to fragile desert habitats, many of the actual site-specific effects of such activity are unknown. Accordingly, the objective of this study was to evaluate the initial impacts of two types of ORVs: motorcycle and 4-wheel drive traffic, on the infiltration rate and sediment production characteristics of two desert soils in response to simulated rainfall. The study was conducted at two sites in southern Nevada on two major types of surface soils: the coppice soil on the low small dunes under shrubs, and the mostly barren interspace soil between shrubs. Motorcycle (50 passes), truck (20 passes), and control treatments were imposed in August 1975 at both locations, at the Blue Diamond site again in January 1976, and at the Crystal Springs site again in April 1976. Different dates were used in 1976 to obtain similar surface moisture conditions on the two sites at time of treatment. Results indicated that infiltration was similar for both soils although more sediment was produced from the surface with exposed mineral soil than from the gravel-mulched surface. Infiltration was from 3-13 times greater on the coppice soil than on the interspace soil, while sedimentation was 10-20 times greater on the interspace soil. Infiltration was less and sediment yield greater after soil was disturbed by vehicular traffic and after reformation of surface crust, particularly on interspace soil. It is concluded that ORV traffic is a major factor in the management of recreation lands, and ways must be found to reduce the damage. (Tickes-Arizona)

EFFECTS OF DAM REMOVAL: AN APPROACH TO SEDIMENTATION,
Hydrologic Engineering Center, Davis, CA.
D. T. Williams.
Technical Paper No 50, October 1977. 31 p, 17 Fig, 10 Ref, 1 Append.

Descriptors: *Model studies, *Sediment transport, *Dams, *Idaho, Hydraulic structures, Analytical techniques, Analysis, Rivers, Hydraulics, Mathematical models, Computer models, On-site investigations, Effects, Data collections, Sediment discharge, Particle size, Streambeds, Dam removal.

In recent years hydraulic structures such as dams have been removed due to deterioration, increased maintenance cost, or obsolescence. Investigation of the hydraulic, hydrologic, and sediment transport consequences of the removal of these structures have been very limited, thus necessitating the establishment of analytical techniques and procedures to predict adequately these effects. A mathematical model (HEC-6) was selected because of its success in the prediction of sediment transport when applied to a wide variety of cases. The removal of the Washington Water Power Dam (WWPD) on the Clearwater River near Lewiston, Idaho, was selected for study. Procedures and techniques of calibration and verification developed, comparison of actual and predicted volume of sediment transported, where the sediment scoured or deposited, and their rates were presented. There was discussion of the applicability of the model to this type of problem, limitations of a one-dimensional model, and interpretation of the results. The comparison of measured and computed final bed elevations, with the dam removed, was very satisfactory. Overall long range trends for each operating condition was as expected. The calculated rate of scour was accurate at the WWPD site (River Mile 4.62) but lagged by approximately ten months at other upstream sections. This difference can be attributed to localized scour and 'layering' of the bed particle distribution. Neither can be modeled by HEC-6. Some of the variations in the rate of scour and deposition can be attributed to the limitations of a one-dimensional model. (Humphreys-ISWS)

2K. Chemical Processes

ARSENIC SPECIES AS AN INDICATOR OF REDOX CONDITIONS IN GROUNDWATER,
Waterloo Univ. (Ontario). Dept. of Earth Sciences.
J. A. Cherry, A. U. Shaikh, D. E. Tallman, and R. V. Nicholson.
Journal of Hydrology, Vol 43, No 1/4, p 373-392, October 1979. 8 Fig, 4 Tab, 28 Ref.

Descriptors: *Water chemistry, *Arsenic compounds, *Oxidation-reduction potential, *Groundwater, Chemistry, Chemicals, Indicators, Sampling, Laboratory tests, Hydrogen ion concentration, Electrochemistry, Thermodynamics, Analytical techniques.

Although the thermodynamically based concept of oxidation-reduction potential has for many decades been an accepted tool for interpretation of the chemistry of hydrochemical systems, attempts at measurement of actual redox levels in natural waters have been fraught with difficulty. Existing methods of measurement involve use of potential-sensing inert metal electrodes or analytical determination of redox-indicator species such as dissolved 02 or Fe(2+) or redox couples such as SO4(2-)--HS(-) and HCO3(-)--CH4. As a result of recent advances in analytical methods, it is now possible to determine the concentrations of both As(III) and As(V) at sufficiently low levels so that the apparent redox condition, as pE or Eh, can be computed from measured concentrations of As(III) and As(V) species. The arsenic pE or Eh domain obtained using published thermodynamic data for As species and the assumption of redox equilibrium provides a basis for obtaining an indication of redox levels within the central portion of the redox field for natural waters. The redox domain for the As couple is largest at high total dissolved As concentrations, but even at concentrations as low as 1-10 micrograms/liter the domain has significant extent. Oxidation and reduction of As(III) and As(V) in laboratory trials with redox agents common to natural waters, such as O2, H2S, and Fe, suggest that oxidation or reduction of As species in natural waters occur at rates sufficiently slow to enable water samples to be collected, transported, and analyzed before excessive change in species distribution takes place, but rapid enough for As species to adjust to the dominant redox condition of the water if periods of years or longer are available for equilibration. Because of the long equilibration time and the position of the pE-pH domain for the As couple, groundwater is best suited for use of As as a redox indicator. (Sims-ISWS)

TIDAL DYNAMICS AND LOW-FREQUENCY EXCHANGES IN THE ARANSAS PASS, TEXAS,
Harbor Branch Foundation, Inc., Fort Pierce, FL.
N. P. Smith.
Estuaries, Vol 2, No 4, p 218-227, December 1979. 10 Fig, 2 Tab, 14 Ref.

Descriptors: *Tidal waters, *Inlets(Waterways), *Texas, *Gulf of Mexico, Currents(Water), Water levels, Winds, Waves(Water), Tides, Coasts, Data processing, Analytical techniques, Estuaries, *Aransas Pass(TX), Tidal dynamics.

Current, water level and wind data collected from a study site at the Aransas Pass, Texas, during a 45-day period in mid-1977 were used to describe tidal motions and low-frequency, meteorologically-forced exchanges between the inner shelf and a series of intracoastal bays. Analysis of individual tidal constituents indicated a mixed but principally diurnal tide. Tidal constituents moved through the Pass as nearly progressive waves. Asymmetry in the co-oscillating tidal motions was explained as a result of unequal frictional forces acting on flood and ebb currents in the Pass. Tidal excursions computed from the tidal harmonic constants and from cumulative net displacements suggested that tidal-period exchanges are not effective in flushing the bays even under tropic tidal conditions. Nontidal water levels were related to the cross-shelf component of the coastal wind stress at statistically significant levels. This suggested that low-frequency local meteorological forcing, as a set-up or set-down of coastal water levels, plays a valuable role in assisting tidally-driven exchanges. (Sims-ISWS)

A THREE-YEAR STUDY OF BENTHOS OF MUDDY ENVIRONMENTS IN PORT PHILLIP BAY, VICTORIA,
Victoria Ministry for Conservation, Melbourne (Australia). Marine Pollution Studies Group.
G. C. B. Poore, and S. Rainer.
Estuarine and Coastal Marine Science, Vol 9, No 4, p 477-497, October 1979. 8 Fig, 6 Tab, 35 Ref.

Descriptors: *Bays, *Benthos, *Biological communities, *Aquatic environment, *Australia, On-site investigations, Sediments, Marine biology, Aquatic life, Seasonal, Variability, Analytical techniques, Statistical methods, Data collections, Benthic fauna, Crustaceans, Foreign research, Foreign countries, Water quality, Water temperature, Salinity, Phosphorus, Nitrogen, *Port Phillip Bay, Polychaetes.

Samples taken four times a year over three years (1973-1975) at three widely separate stations in muddy environments in Port Phillip Bay were used to compare species diversity and composition of the benthic community between areas, seasons, and years. Analysis of variance of five community statistics: the number of individuals, the number of species, Shannon's diversity, and two evenness measures, showed that differences among the three stations and among years contributed the largest fractions of the variance in number of individuals and species but little to diversity or evenness. Seasonal differences contributed negligibly to variance in any statistic except diversity. Small scale spatial patchiness (from replicate samples within stations) contributed a significant fraction of variance to all five statistics. The fauna at all stations was dominated by the deposit-feeding bivalve Theora fragilis and the decapod shrimp Callianassa limosa; only minor species were restricted to single stations. The density of few species varied seasonally, but several were more abundant in some years than others. Hierarchical classification using the Canberra metric dissimilarity coefficient grouped samples into station groups. Use of the Bray-Curtis coefficient grouped some samples by station and some by season, and it was concluded that the main differences between stations were in overall species composition, not in the densities of dominant species. Temporal changes in community structure were nonseasonal but were irregular changes occurring at single stations. Differences in

fauna between stations were related in part to small differences in sediment-type but not to physico-chemical features of the overlying water. The irregular fluctuations in density of the common species and in the identity of the minor species suggest that multiple-stable points in community structure may exist for the silty-clay community. The two major species seemed not to have altered each other's environment over the sampling period. Considerable variation in species composition may occur in soft-bottom benthos in the absence of marked environmental perturbations. (Humphreys-ISWS)

ZINC IN THE CONWY RIVER AND ESTUARY,
Leeds Univ. (England). Dept. of Earth Sciences.
H. Elderfield, A. Hepworth, P. N. Edwards, and L. M. Holliday.
Estuarine and Coastal Marine Science, Vol 9, No 4, p 403-422, October 1979. 10 Fig, 4 Tab, 45 Ref.

Descriptors: *Estuaries, *Water pollution sources, *Zinc, *Diagenesis, Sediments, Iron, Manganese, Pollutants, Heavy metals, On-site investigations, Rivers, Spatial distribution, Data collections, Analytical techniques, Connate water, Water quality, Solubility, Sulfides, Estuarine environment, Foreign research, Foreign countries, *Wales, *Conwy River(Wales).

The objective of this research was to identify the important inorganic reactions which control the behavior of zinc supplied to waters of the Conwy River and Estuary in North Wales, a region free of heavy urban and industrial pollution, but subject to the effects of mineralization; this included an examination of the diagenesis of zinc in anoxic estuarine sediment. Several factors were identified which contribute to the geochemical balance of zinc in the Conwy River and Estuary. (1) Precipitation of iron and manganese which are mobilized in acid, reducing soils acts to remove dissolved zinc from tributary streams and to promote a particulate flux in the river of zinc associated with hydrous iron and manganese oxides. (2) There is no large-scale removal of dissolved zinc during the mixing of river water and sea water in the estuary. (3) Zinc is precipitated with iron as an insoluble sulphide in anoxic estuarine sediments. (4) Because of diagenetic remobilization processes, the surface layer of estuarine sediments is enriched in iron and manganese, and, to a lesser extent, zinc. Resuspension of this layer may promote the formation of zinc-rich particles in bottom waters of the estuary. Further work is required in estuaries where two-end-member mixing can be demonstrated in order to provide more precise information as to whether removal of zinc and other heavy metals can occur through the flocculation of dissolved iron at low salinities. In addition, more comprehensive and mechanistically-oriented studies are urgently needed on the distribution of dissolved metals in pore waters of sulphide-rich sediments. (Humphreys-ISWS)

A VARIABLE-DEPTH GREEN'S FUNCTION FOR SHELF EDGE TIDES,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Oceanography.
C. Garrett, and B. Toulany.
Journal of Physical Oceanography, Vol 9, No 6, p 1258-1272, November 1979. 15 Fig, 1 Tab, 10 Ref.

Descriptors: *Tides, *Continental shelf, *Model studies, Mathematical models, Theoretical analysis, Oceans, Coasts, Gulfs, Equations, Mathematics, Oceanography, *Gulf of Maine, *Bay of Fundy.

The Green's function for a semi-infinite ocean with depth a function of distance from the boundary was developed numerically for the M sub 2 frequency and with Coriolis frequency and depth profile appropriate to the continental slope off the Gulf of Maine. This involved numerical integration of the linearized shallow water equations for all longshore wave numbers, followed by numerical Fourier transformation. This variable-depth Green's function is approximately equal to Buchwald's constant-depth Green's function for distances along the boundary greater than the width of the slope, and at very short range tends to limiting values which can be approximated analytically. The Green's function, when combined with currents from Greenberg's numerical model of the Bay of Fundy and Gulf of Maine, was used to explain substantial observed variations in M sub 2 amplitude and phase along the edge of the shelf off the Gulf of Maine; the variable-depth Green's function produced significantly better results than the constant-depth Green's function. The results supported the basic premise that the M sub 2 elevation at the shelf edge in the absence of the Gulf of Maine would be fairly constant, and suggested ways of deriving open boundary input for tidal models of coastal seas with a minimum of offshore gaging. AN APPROACH FOR HYDRODYNAMIC MODELING OF MAINE'S ESTUARIES,
Maine Univ. at Orono. Dept. of Civil Engineering.
R. B. Fidler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139595, Price codes: A05 in paper copy, A01 in microfiche. MS thesis August 1979. 85 p, 23 Fig, 1 Tab, 27 Ref, OWRT A-047-ME(2).

Descriptors: *Maine, *Mathematical models, *Estuaries, *Water pollution, *Hydrodynamics, Computer models, Water circulation, Currents(Water), Hydraulics, Movement, Tides, Winds, Hydrologic aspects, Hydraulic models.

A hydrodynamic study of the Upper Penobscot Bay in Maine was conducted using a three dimensional finite difference model. Penobscot Bay is a major commercial, industrial, and fishing center for the state. Models for water and waste movement are needed due to the rapid industrial growth along Maine's coast and the subsequent water pollution problems. Maine currently has no site suitability classification system for its coastal area. The model used here, GAL (for Galerkin) was implemented on the University of Maine IBM 370 System and to supplement printed output, pictoral representations of calculations current velocities are provided. The numerical model is widely applicable and reasonably inexpensive. Several prior hydrographic studies of the Bay were used to provide model data. Five sets of data are needed for the model: (1) bathymetry, (2) tidal, (3) river flow, (4) wind, and (5) current characteristics data. The Navier-Stokes equations and the continuity equations are used to describe processes causing water motion. A summary of GAL's mathematical and numerical development is given. Thirteen simulations were run providing successful significant information. A comparison of model results and actual field data show some success of describing Bay hydrodynamics. (Seigler-IPA)

COMPUTER SIMULATION OF STORM SURGES AND RIVER FLOODING IN MOBILE BAY,
Alabama Univ., University. Dept. of Chemical Engineering.
G. C. April, and S. Hu.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-138514, Price codes: A07 in paper copy, A01 in microfiche. Bureau of Engineering Research Report No 232-112, March 1979. 138 p, 36 Fig, 13 Tab, 26 Ref, 3 Append. OWRT A-061-ALA(2).

Descriptors: *Model studies, *Computer models, *Hurricanes, *Surges, *Flood forecasting, Alabama, Gulf of Mexico, Tides, Salinity, Saline water, Winds, Hydrodynamics, Bays, Estuaries, River basins, Mobile River, Mobile Bay.

A modified Reid-Bodine hydrodynamic-salinity model and an open coast water model were used on the University of Alabama Univac-1110 computer system to simulate the Mobile Bay, Alabama, system under severe storm surge and/or flooding conditions. Mobile Bay with an area of 1036 sq km is located east of the Mississippi River delta on the north-eastern shore of the Gulf of Mexico. It is the terminus of the Mobile River basin and is the fourth largest drainage area in the U.S. The Bay is 50 km long and from 13 to 38 km wide. Historically hurricanes have caused much destruction in the area with 55 hurricanes affecting Alabama from 1711 through 1972. Hurricanes cause both surges in the bay and river flooding. Data input and sources are described including river flooding input data and storm surge input data with conformal mapping and storm surge equations. Model calibration and verification are also described. The model is used to describe water behavior during river flood stage as a function of river discharge rate. Results show that during river flood stage, Bay water properties are dominated by fresh river water. However, during storm surge conditions large amounts of saline water enter the Bay. The model is used to calculate water elevation, velocity, and salinity as a storm approaches. Comparison of model results with field data show reasonable accuracy. (Seigler-IPA)
W80-03088

IMPACT OF DELTA OUTFLOW UPON SALINITY AND WATERFOWL IN THE SUISUN MARSH,
Bureau of Reclamation, Washington, DC.
M. C. Rumboltz.
November 1979. 206 p, 161 Fig, 14 Tab, 1 Append.

Descriptors: *Saline water, *Wildlife habitats, *Ducks(Wild), *Model studies, Bays, California, Estuarine environment, Brackish water, Waterfowl, Water birds, Green-winged teal, Mallard duck, Shoveler duck, American widgeon, Tidal waters, Suisun Marsh.

Historical salinity levels in the Suisun Marsh and freshwater outflow from the Sacramento-San Joaquin Delta were studied and a Delta outflow model and salinity equations were developed to test management alternatives and to predict future salinities. The Suisun Marsh, located in the San Francisco Bay Estuary, is a wintering area or home for 200 species of birds, 45 species of mammals, and 36 species of reptiles. Birds wintering in the Marsh include the pintail duck, the American wigeon, mallards, shovelers, and green-winged teals. The Marsh is brackish with salinity levels ranging from 50 micromhos to 27,600 micromhos with 4,700 to 18,000 micromhos suggested as optimum for promoting waterfowl food plants. Low salinity levels occur during winter and spring when Delta outflow is high with high salinity levels occurring in summer and fall when outflow is low. Salinity/outflow equations were developed and verified to predict mean monthly salinity. The equations were used to join Delta outflow to the Marsh salinity model. Results from the use of the model indicate that in February through May Delta outflow will not be sufficient to provide optimum salinity. Various management alternatives to maintain optimum salinity levels include tide gates, waste water reuse, freshwater release, and rerouting of sloughs. Although salinity levels may be improved in the future to produce more food for ducks, duck populations may not increase. Extensive data plots are included. (Seigler-IPA)

SOLAR ENERGY COLLECTORS AND PLANTS OPERATED BY THEM,
N. Laing, I. Laing, and O. Laing.
U.S. Patent No 4,172,766, 20 p, 14 Fig, 15 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1205, October 30, 1979.

Descriptors: *Patents, *Desalination, *Solar radiation, Water purification, Sea water, Energy conversion, Electric power production, Desalination equipment.

The object of the invention is to provide a solar collector which is designed to float on water or air and which comprises elastic elements not subject to bending stresses within the range of their application. Water surfaces offer favourable conditions for collectors intended to be spread over a flat surface. Collectors comprise several flexible layers of which the lowest is an insulating layer, the layer above it conducts a heat carrier and the top layer serves to prevent convection losses. These layers can be prefabricated in the form of elements of large surface area. They are assembled by joining a large number of identical elements into a complete floating platform which in turn, is surrounded by peripheral elements so designed as to make a radial prestretching of the solar collector elements possible. A preferred field of application is electricity generation. In this application, a fluid heat carrier is pumped through ducts in the heat carrier conducting layer. The head so extracted heats of a quantity of stored water in a foil container immersed in the water. The heat may serve for feeding a turbine. If sea water is evaporated then the condensate can be extracted as fresh water. However the plant may also be so designed that it is entirely deployed for sea water distillation. In this case, the heat of condensation is drawn on for repeated distillation in further stages. (Sinha - OEIS)
W80-03225

WATER PURIFICATION SYSTEM,
W. E. Sear.
U.S. Patent No. 4,172,767, 6 p, 4 Fig, 12 Ref; Official Gazette of the United States Patent Office, Vol 987, NO 5, p 1205, October 30, 1979.

Descriptors: *Patents, *Water treatment, *Desalination, Water purification, Sea water, Solar radiation, Condensation, Desalination equipment.

The concept of the invention involves the provision of a system comprising a tank into which sea water or impotable water normally flows or settles. The top of this tank is covered by a plastic cover which is able to accomodate and pass the heating rays of the sun. Thesun's rays passing through this plastic cover causes the water captured within the tank portion to vaporize. As a result, the water within the tank becomes vaporized within the upper portion of the cover and above the sea water in the form of moisture-laden air. This moisture-laden air is then conveyed by a blower arrangement into a pipe line of any suitable material. The water condensrs as it passes through the line from an area of one temperature to an area of another and lower temperature. A fluid pump is provided in the line to pump the pure water into a fresh water storage tank where it can be stored pending transportation to the source using the fresh water. The entire unit may be supported in a float arrangement where some parts are suspended above the sea level while others are anchored below the sea. (Sinha-OEIS)

3C. Use Of Water Of Impaired Quality

SEWAGE EFFLUENT AND LIQUID DIGESTED SLUDGE AS AIDS TO REVEGETATION OF STRIP MINE SPOIL AND ANTHRACITE COAL REFUSE BANKS,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
L. T. Kardos, W. E. Sopper, B. R. Edgerton, and L. E. DiLissio.
In: Utilization of Municipal Sewage Effluent and Sludge on Forest and Disturbed Land, p 315-331, 1979. 14 Fig, 15 Tab, 18 Ref. OWRT B-047-PA(10), B-069-PA(6).

Descriptors: *Sewage effluents, *Sludge disposal, *Coal mine wastes, *Vegetation establishment, Revegetation, Legumes, Grasses, Trees, Leachate, Soil chemistry, Acidic soils, Strip mines, Spoil banks, Chemical analysis, Lysimeters.

Sewage effluent and liquid digested sludge were used as ameliorating agents for revegetation of bituminous strip mine spoil and anthracite refuse in Pennsylvania. Revegetation of such areas is hampered by excessive acidity with high levels of iron, aluminum, and manganese; plant nutrient deficiency; drought; and lethally high surface temperatures. Plants used for revegetation included eight grass species, eight legume species, and eight tree species. Experimental treatment boxes contained 25 tons of spoil or refuse over a 6 inch layer of quartz sand resting on Hublersburg silt loam. Three lysimeters were used in each box to sample percolate water. Effluent and/or liquid sludge were applied at weekly intervals in amounts ranging from 0 to 5 cm. Weekly samples of effluent, liquid sludge, and leachate were analyzed for pH, total acidity, sulfates, nitrate N, organic N, ammonium N, orthophosphate P, total P, potassium, calcium, magnesium, manganese, iron, copper, boron, aluminum, zinc, and sodium. Results show that sewage effluent and/or liquid digested sludge will detoxify both spoil and refuse and promote the establishment of a vegetative cover that will persist. Greater growth after establishment can be obtained by periodic effluent or sludge applications. None of the legumes were found to be as productive as the grasses, and tree seedling survival rates were improved by the treatments. (See also W80-03089) (Seigler-IPA)

3D. Conservation In Domestic and Municipal Use

WATER REQUIREMENTS FOR URBAN LAWNS,
Arizona Univ., Tucson. Dept. of Plant Science.
W. R. Kneebone, I. L. Pepper, R. E. Danielson, W. E. Hart, and L. O. Pochop.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-140080, Price codes: A10 in paper copy, A01 in microfiche. Water Resources Research Institute Wyoming University, Laramie, Project Completion Report, September 1979. 217 p, 24 Fig, 67 Tab, 18 Ref, 9 App. OWRT B-035-WYO(6), 14-34-0001-7201.

Descriptors: *Water requirements, *Sprinkler irrigation, *Lawns, *Turf grasses, Lysimeters, Arizona, Colorado, Wyoming, *Urban lawns.

Water requirements and application rates of urban lawns were studied in a 3-state (Arizona, Colorado and Wyoming) area. The study measured the water use of Kentucky bluegrass in Colorado and Wyoming, and of different bermudagrass cultivars, zoysia, St. Augustine grass and tall fescue in Arizona. The overall objective of the study was to obtain measured data concerning water use of urban lawns. This was accomplished by: (1) determining water requirements by use of lysimeters, (2) monitoring actual water application rates by homeowners, and (3) testing common sprinklers to determine their distribution patterns. A wide range of conditions were represented by the project. As indicated, Arizona worked with warm-season grasses, while Colorado and Wyoming worked with bluegrass. This, plus the fact that the study sites represent a wide north-south segment of the region, should make the results widely applicable. To make the findings further applicable they were prepared in the form of lawn watering guidelines that can be used by water managers.

3F. Conservation In Agriculture

EFFICIENCY IN THE USE OF WATER FOR IRRIGATION: THE ROLE OF PRICES AND REGULATIONS,
United Nations Centre for Natural Resources, Energy and Transport, NY.
H. M. Neghassi, and J. A. Seagraves.
Natural Resources Forum, Vol 3, No 4, p 53-72, 1978. 1 Fig, 6 Tab, 19 Ref.

Descriptors: *Water distribution(Applied), *Water allocation(Policy), *Irrigation programs, *Pricing, *Regulation, *Irrigation efficiency, Water conservation, Water management(Applied), Mexico, Economics, Water rates, Economic efficiency, Administrative agencies, Water policy, Low flow, Irrigation districts, Irrigation practices, Irrigation water, Agriculture.

Although engineering and agronomic constraints usually define the degree of efficiency necessary for use of irrigation water in any setting, artificial pricing and governmental regulation can both support improvements in equitable and efficient water use for agriculture. Using examples and case studies, the paper discusses physical and economic irrigation efficiencies and their interrelationships; the role of pricing and regulations is emphasized and general guidelines are explored for use of fixed-rate and volumetric rate pricing structures. Factors considered include: (1) value and resource combinations which relate to physical and economic efficiency in water use; (2) factors affecting prices and regulations for irrigation waters; (3) factors affecting prices and regulations for irrigation water; (4) pricing of irrigation water and alternative systems of delivering it to farms; and (5) water laws and ownership. A case study of irrigation water pricing in Mexico demonstrates that charges based on water volume or the number of irrigation events makes farmers more careful in their use of water, thus contributing to application efficiency, whereas flat rate charges per hectare or per season give no incentive to conserve water. Institutional arrangements for managing water from irrigation canals are affected by the extent to which flow can be regulated by such means as a reservoir. Since volumetric measurements are costly, they are recommended only when the value of water is high enough and the flow can be regulated. When flows are uncertain shares of the water rather than specific volumes should be allocated to individual farms. (Harris-Wisconsin)
W80-03140

LINEAR MOVE IRRIGATION SYSTEM AND CONTROL THEREFOR,
Valmont Industries, Inc., Valley, NE. (Assignee).
T. M. Johnson.
U.S. Patent No 4,172,551, 15 p, 17 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1134, October 30, 1979.

Descriptors: *Patents, *Irrigation systems, *Control systems, Automatic control, Irrigation practices, Irrigation efficiency, Irrigation operation and maintenance.

A linear move irrigation system and control for use in irrigating large land areas includes a water conduit extending over a portion of the field supported on a series of support towers. The entire conduit is made to move down the field to be irrigated. A control system controls the movement of the irrigation system along a defined path and maintains the wheel tracks of the conduit support towers generally parallel to the path. The control system includes a sensor located somewhere along the water conduit for sensing when a point located forward of the conduit relative to its direction of

travel, is off the defined path. The movement of outwardly located towers near opposite ends of the conduit are automatically controlled in response to predetermined displacement of the point relative to the path. The towers are preferably located at opposite ends of the conduit, so as to maintain the point over the defined path, and further to maintain the wheel tracks of the conduit support towers generally parallel as the system moves over the field. The controlled towers near opposite ends of the conduit are normally driven when the point is on the path. (Sinha-OEIS)
W80-03196

SELF-PROPELLED LINEAR IRRIGATION SYSTEM,
N. S. Standal.
U.S. Patent No 4,172,556, 14 p, 16 Fig, 10 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1136, October 30, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Application equipment, Irrigation practices, Irrigation efficiency, Irrigation operation and maintenance, Self-propelled pneumatic systems.

A self-propelled linear irrigation system including an elongated line move having sprinkler outlets along its length, mobile supports spaced along the line move and a main tractor having a water pipe outlet engaging member and a fluid powered prime mover is disclosed. The propulsion system comprises a pneumatic system involving a main compressed air line and compressed air storage tank on the main tractor and each mobile support. The tractor of the irrigation system has automatic coupling members for coupling to the water supply and compressed air supply and automatically propels itself from one compressed air and water station to the next compressed air and water station along a main supply line. The main tractor has a main rigid central section having connecting members for connecting the tractor with the elongated line move and a first and second valve car, each having extensible propulsion members connecting each valve car to the main section. The tractor also has a drift correction system to maintain the tractor and line move traveling along a straight course, parallel to the main water supply line. (Sinha-OEIS)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

URBAN STORMWATER CONTROL PACKAGE FOR AUTOMATED REAL-TIME SYSTEMS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. W. Labadie, D. M. Morrow, and R. C. Lazaro.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139785, Price codes: A11 in paper copy, A01 in microfiche. Completion Report, December 1978. 234 p, 47 Fig, 22 Tab, 12 Ref, 5 Append. OWRT-C-6174 (5218)(3).

Descriptors: *Urban runoff, *Automatic control, *Computer models, *Storm runoff, Storm drains, Interceptor sewers, Storm water, Urban drainage, Combined sewers, Storage requirements, Water pollution sources, Numerical analysis, California, Runoff forecasting, Timing.

A methodology is presented for automatic computer control of in-line sewer storage as a cost-effective means of limiting water pollution for storm and combined sewer overflows. The methodology called a Stormwater Control Package (SWCP) involves the application of realistic computer models for inflow forecasting, sewer routing, and operational storage control for real-time simulated environments. Controllable in-line storage uses adjustable weirs, valves, or gates in interceptors, laterals, or outfalls to create backwater that is stored to prevent an overflow of untreated stormwater. Because rapid response is needed to deal with the complex flow characteristics occurring during a storm, automated computer control is needed. Fully automated control requires three systems: intelligence, central processing, and regulators. SWCP uses an autoregressive transfer-function type forecasting model and can be used as a tool to design and test automatic control systems. SWCP's control algorithm is described with a unique method for integrating unsteady flow and optimal control. The control package is applied to San Francisco's Marina Branch of the North Shore Outfalls Consolidation Project to demonstrate SWCP's potential usefulness. Results are presented along with reactive and adaptive control policies with an analysis of performance of control strategies. (Seigler-IPA)

PUBLIC DRAINAGE ATLAS: BROWN COUNTY, MINNESOTA,
Mankato State Univ., MN. Dept. of Biology.
L. Dunsmore, R. W. Oelerich, and H. W. Quade.
Limnological Contribution No 10, June 1979. 57 p, 69 Fig, 36 Tab. OWRT A-040-MINN(4).

Descriptors: *Drainage, *Ditches, *Minnesota, *Mapping, Hydrology, Computer models, Watersheds(Basins), Land use, Agricultural engineering, Drainage engineering, Geomorphology, Distribution patterns, Hydrography, Terrain analysis, River basins, Drainage systems.

Drainage data maps and tables are presented for Brown County in south central Minnesota. The data are to be used for the development of a computer modeling system of drainage effects. Drainage system features include ditches and riversheds. The planned computer modeling will aid planning for lake restoration, new ditch construction, and water resources development. An inventory of all county ditches is provided including ditch number, location, year established, length, area drained, tributary to, and rivershed. For consistency and ease of comparison, the Minnesota Land Management Information System (MLMIS) format is used. This format is also consistent with the United States land survey system. The county is divided into 40 acre townships which are subdivided in 36 sections made of 16 fourth acre parcels. For each of the 20 townships, data for four MLMIS variables are presented: land use, water orientation, soil landscape, and geomorphic regions. General land survey maps and present surface hydrology maps are also presented for each township as well as for the whole county. An overall Brown County ditch map shows ditches by decade of establishment and type (open or tiled). (Seigler-IPA)
W80-03095

PUBLIC DRAINAGE ATLAS: NICOLLET COUNTY, MINNESOTA,
Mankato State Univ., MN. Dept. of Biology.
L. Dunsmore, and H. W. Quade.
Limnological Contribution No 8, June 1979. 61 p, 82 Fig, 30 Tab. OWRT A-040-MINN(5).

Descriptors: *Drainage, *Ditches, *Minnesota, *Mapping, Hydrology, Computer models, Watersheds(Basins), Land use, Agricultural engineering, Drainage engineering, Geomorphology, Distribution patterns, Hydrography, Terrain analysis, River basins, Drainage systems.

Tables and maps of drainage data are presented for Nicollet County located in south central Minnesota. Drainage data primarily consist of ditches and riversheds since ditches are of agricultural importance in the area. Data are being collected for the ultimate development of a computer modeling technique for drainage effects. The model will be used for planning involving new drainage ditches, lake restoration, and other water resources development. An inventory of all county ditches is presented including ditch number, location, year established, length, area drained, tributary to, and rivershed. Data are presented according to the Minnesota Land Management Information System (MLMIS) format because it is consistent with the United States land survey system and because much data were taken from MLMIS. The system divides the county into 40 acre townships which are subdivided into 36 sections made of 16 fourth acre parcels. Data are presented for each of the county's 22 townships including general survey maps, present surface hydrology maps, land use tables, water orientation tables, soil landscape tables, and geomorphic regions tables. An overall Nicollet County ditch map is also presented along with overall maps for land use, water orientation, soil landscape, and geomorphic regions. (Seigler-IPA)
W80-03096

PUBLIC DRAINAGE ATLAS: LESUEUR COUNTY, MINNESOTA,
Mankato State Univ., MN. Dept. of Biology.
L. Dunsmore, and H. W. Quade.
Limnological Contribution No 7, May 1979. 51 p, 59 Fig, 33 Tab. OWRT A-040-MINN(3).

Descriptors: *Drainage, *Ditches, *Minnesota, *Mapping, Hydrology, Computer models, Watersheds(Basins), Land use, Agricultural engineering, Drainage engineering, Geomorphology, Distribution patterns, Hydrography, Terrain analysis, River basins, Drainage systems.

Drainage data are presented in the form of maps and tables for LeSueur County in south central Minnesota. Data are being collected for the ultimate development of computer modeling of drainage effects. Due to agricultural needs, drainage in the county is mostly in the form of ditches. The planned computer modeling will aid in planning for water resources development, lake restoration, and proposed new drainage ditches. An inventory of all county ditches is presented including ditch number, location, year established, length, area drained, tributary to, and rivershed. The Minnesota Land Management Information System (MLMIS) format is used because it is consistent with the United States land survey system and because much data were obtained from the system. The county is divided into townships each subdivided into 36 sections made of 16 fourth acre parcels. General land survey maps and present surface hydrology maps are presented for each of the county's 17 townships. Also provided are data on land use, water orientation, soil landscape, and geomorphic regions. Drainage data are also provided by rivershed. (Seigler-IPA)

THE EFFECTS OF THE FOOD PREFERENCES AND STOCKING RATES OF GRASS CARP (CTENOPHARYNGODON IDELLA VAL.) ON MIXED PLANT COMMUNITIES,
Agricultural Research Council, Kidlington (England). Weed Research Organization.
M. C. Fowler, and T. O. Robson.
Aquatic Botany, Vol 5, No 3, p 261-276, 1978. 5 Fig, 5 Tab, 22 Ref.

Descriptors: *Aquatic weed control, *Grass carp, *Biocontrol, *Food habits, Algal control, Chara, Potamogeton pectinatus, Fish behavior, Predation, Fish stocking, Forage palatability, Elodea canadensis, Myriophyllum spicatum L., Potamogeton natans L., Ecology, Prey fish, Algae, Aquatic weeds, Browse utilization, England.

Results of two years of studies of the effect of grass carp grazing preferences in a mixed-plant aquatic weed community are reported. In a series of pond experiments conducted in Great Britain to replicate similar studies in other countries, small (10-30 g) grass carp (Ctenopharyngodon idella Val.) selectively grazed submerged weeds. In all the experiments, the carp ate their favorite species

first, i.e. Charasp., Potamogeton pectinatus and Elodea canadensis, and ignored the less-palatable Myriophyllum spicatum L. and P. natans L. Originally the total plant biomass was reduced as the palatable plants were grazed; however, the avoided species spread and eventually total biomass was similar to that in ungrazed pools. Some of the heavily grazed plants (P. pectinatus and Chara sp.) re-established themselves when the fish were removed. Only after a prolonged period without food did the fish begin grazing unpalatable plants. Similar results were obtained in ponds with bigger fish (200-400 g). These feeding behavioral experiments were showing that total plant biomass is quickly reduced after the introduction of fish for aquatic weed control purposes, especially at higher stocking rates; but these results are brought about only by the fish quickly eating the more-pallatable plants. For weed control purposes, the proportion of palatable to unpalatable plants in a weed community will determine the stocking rate needed to show rapid control of weeds. Generally, understocking should be avoided unless other measures are added to control the less-palatable plants. (Harris-Wisconsin)

Descriptors: *Land reclamation, *Strip mines, *Land management, *Erosion control, Surface runoff, Flow control, Water pollution control, Planning, Surface mining control.

A multiattribute utility function is used to model preferences on outcomes of alternative reclamation schemes for stripmined lands, using Arizona and Wyoming examples. Each scheme should at least help restore land to its premining value, and is composed of three sets of actions: mining operations, preparations for postmining land use, and mitigating actions. Grazing and runoff augmentation are examples of postmining land use goals, and mitigating actions may be measures to protect the environment like pollution control in runoff or infiltration. Conflicting objectives are involved, including the maintenance of sufficient coal production, the alleviation of detrimental environmental effects, and the minimization of loss. Since the environmental effects are fraught with uncertainty, a multiobjective decision-making scheme under uncertainty is set up to analyze the problem. The decision model ranks alternative reclamation schemes on the basis of the preference function of a group decision maker, each member of which assessing a separate subset of single attribute utility functions.

SOIL SEDIMENT DEPOSITS IN SUBSURFACE DRAINS,
Science and Education Administration, Brawley, CA. Imperial Valley Conservation Research Center.
L. B. Grass, L. S. Willardson, and R. A. LeMert.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 5, p 1054-1057, September-October 1979. 6 Fig, 2 Tab, 17 Ref.

Descriptors: *Tile drains, *Subsurface drains, *Sediments, *Clogging, *California, Deposition(Sediments), Drains, Drainage, Drainage practices, Tiles, Soils, Soil water, Irrigation, Salinity, On-site investigations, Agriculture.

The possible mode of sediment entry into drains may be determined by comparing the particle-size distribution curves of the deposits with those of corresponding soils. Some deposits will be finer, some similar, and some coarser in texture than the soil. Variations in texture are due to a sorting process effected by the envelope, by reductions in water-flow velocity, by breaks or loose joints in the drain pipe, or by the effluents washing the fine sediments out of the drain. The dispersive effect of a high sodium content can also influence the texture of the deposit. (Sims-ISWS)

CONNECTOR WELLS, A MECHANISM FOR WATER MANAGEMENT IN THE CENTRAL FLORIDA PHOSPHATE DISTRICT,
LaMoreaux (P. E.) and Associates, Inc., Tuscaloosa, AL.
P. E. LaMoreaux.
Journal of Hydrology, Vol 43, No 1/4, p 469-490, October 1979. 8 Fig, 4 Tab, 24 Ref.

Descriptors: *Recharge wells, *Florida, *Water management(Applied), *Siphons, *Groundwater recharge, Injection wells, Potentiometric level, Water table aquifers, Aquifer testing, Hydraulic properties, Pumping, Water wells, Aquifers, Phosphates, Percolation, *Floridan aquifer, Connector wells, Siphon wells, Gravity flow.

Connector wells, a mechanism for water management in the Central Florida Phosphate District, have proven to be an effective means of moving good quality groundwater from one formation downward to another under gravity flow; there results beneficial recharge to the underlying Floridan Aquifer and a solution to a dewatering problem that enhances the mining of the phosphate ore. Three unique recharge systems have been developed in the phosphate district of Florida that include recharge through connector wells by gravity flow of water from the overburden sand aquifer to the Floridan Aquifer, a system of siphon wells recharging water from the overburden to the underlying Floridan Aquifer by connector wells. The siphon well recharging system has also been used effectively to relieve head or hydrostatic pressures built up in dams and dikes. (Visocky-ISWS)

PROBLEMS OF LARGE-SCALE GROUNDWATER DEVELOPMENT,
Hebrew Univ., Jerusalem (Israel). Center for Groundwater Research.
S. Mandel.
Journal of Hydrology, Vol 43, No 1/4, p 439-443, October 1979. 3 Ref.

Descriptors: *Groundwater, *Water resources, *Planning, *Water management(Applied), Water resources development, Water supply development, Wells, Water wells, Technology, Social aspects, Legal aspects, Water supply, Groundwater mining, Technical factors.

The difficulties encountered in the planned development of groundwater resources were analyzed by comparing typical 'scripts' for surface and groundwater resources, respectively. The suggested remedies were: (1) campaigns of systematic field investigations in any area where the intensive exploitation of groundwater is envisaged; (2) standardization and codification of modern research techniques so that they can more readily be used by any investigator; (3) the construction of water supply networks serving more than one user in order to stimulate cooperation and mutual control among water users and to facilitate the centralized regulation of groundwater abstraction. (Sims-ISWS)

WATER BUDGET AND HYDRAULIC ASPECTS OF ARTIFICIAL RECHARGE, SOUTH COAST OF PUERTO RICO,
Geological Survey, Fort Buchanan, PR. Water Resources Div.
J. E. Heisel, and J. R. Gonzales.
Geological Survey Water-Resources Investigations 78-58, May 1979. 102 p, 44 Fig, 17 Tab, 12 Ref.

Descriptors: *Aquifer management, *Groundwater recharge, *Model studies, *Artificial recharge, *Puerto Rico, Injection wells, Irrigation water, Infiltration, Water levels, Water quality, Evaluation, Analog models, *South-coastal Puerto Rico.

An analog model was used to evaluate groundwater conditions on the south coast of Puerto Rico. Water levels during a normal period and during an extended drought were simulated. Recharge and discharge values are reported. The model was also used to evaluate the possibilities of using treated waste water to recharge the aquifer. Three methods were considered: infiltration basins, injection, and irrigation. The tests were planned to determine what changes in water levels would result if certain rates of application were used. Because of the limited vertical hydraulic conductivity, irrigation is suggested as the most practical method of waste-water use. (Woodard-USGS)

4C. Effects On Water Of Man's Non-Water Activities

EFFECTS OF GRAZING ON RUNOFF AND SEDIMENT YIELD FROM DESERT RANGELAND AT BADGER WASH IN WESTERN COLORADO, 1953-73,
Geological Survey, Lakewood, CO. Water Resources Div.
G. C. Lusby.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.50. Geological Survey Water-Supply Paper 1532-I, 1979. 134 p, 10 Fig, 1 Plate, 11 Tab, 9 Ref.

Descriptors: *Grazing, *Effects, *Runoff, *Sediment yield, *Range management, Evaluation, Sheet erosion, Storm runoff, Rainfall-runoff relationships, Soil types, Arid lands, Colorado, Utah, *Badger Wash(CO), Desert rangeland, Cattle grazing, Sheep grazing, Grazing rotation.

Four different systems of livestock management were compared hydrologically during a 20-year study (1953-73) in western Colorado. These systems were (1) grazing by cattle and sheep from November 15 to May 15 each year, (2) complete elimination of grazing, (3) grazing by sheep from November 15 to February 15 each year, and (4) grazing by sheep from November 15 to February 15 every other year. Grazing by both cattle and sheep from November 15 to May 15 each year was the standard grazing practice in the area at the beginning of the study. Complete grazing exclusion resulted in a reduction in runoff of about 20 percent during the period 1953-65 and an additional 20 percent during 1966-73. During the same periods sediment yield was reduced by 35 and 28 percent, respectively, for a total of 63 percent. A change in grazing use from cattle and sheep, November 15 - May 15 each year, to sheep only at approximately the same utilization rate, November 15 - February 15 each year, was accompanied by a reduction in runoff and sediment yield of about 29 percent. The same change in use, except for grazing allowed every other year during the sheep grazing period, resulted in a reduction in runoff and sediment yield of about 20 percent. (Woodard-USGS)

EFFECTS OF STEM DENSITY UPON SEDIMENT RETENTION BY SALT MARSH CORDGRASS, SPARTINA ALTERNIFLORA LOISEL,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
M. L. Gleason, D. A. Elmer, N. C. Pien, and J. S. Fisher.
Estuaries, Vol 2, No 4, p 271-273, December 1979. 4 Fig, 6 Ref.

Descriptors: *Sediments, *Sands, *Grasses, *Beaches, Waves(Water), Vegetation, Vegetation establishment, Deposition(Sediments), Coasts, Shores, Slopes, Erosion, Erosion control, Laboratory tests, Salt marsh cordgrass.

A laboratory experiment was conducted to determine whether retention of waterborne sand by salt marsh cordgrass, Spartina alterniflora Loisel, is directly related to the number of stems per unit area. Waves generated in a trough washed over a sloping beach planted with S. alterniflora springs; a range of stem densities (0-108 stems/sq m) was examined in separate trials. The amount of sand accumulated after 60 waves was a positive nonlinear function of stem density. The greatest accretion coincided with the highest stem density tested. Shape of the beach profile was also strongly influenced by the number of stems per sq m. (Sims-ISWS)

PREVENTION OF LONG-TERM ECOLOGICAL DAMAGE IN A DROUGHT,
Botswana Ministry of Agriculture, Gaborone. Div. of Land Utilization.
F. S. Alidi.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 261-268, 1979. 1 Tab, 3 Fig.

Descriptors: *Droughts, *Water management(Applied), *Accelerated erosion, *Weather data, Carrying capacity, Runoff, Grazing, Natural resources, Livestock, Burning, Wind erosion, Soil erosion, Botswana.

Several means by which long-term ecological damage by drought in Botswana can be minimized are discussed: (1) training and education of agriculturists and meteorologists, particularly with regard to water use, (2) establishment of weather stations to supply the country with weather reports and data to help in the development of water sources for agriculture and industry, (3) dissemination of a better understanding of the causes and effects of overgrazing, veld fires, devegetation, lack of soil cover, lack of protection against wind and rainfall erosion - at the local level particularly, (4) stabilization of areas against further desert encroachment by planting harider species and by avoiding overexploitation of that area, (5) reduction of wildlife and livestock populations to correlate with carrying capacity, and (6) improved farming methods for crop production. The effect of devegetation on local water balance is most significant when bare soil is less able to capture and absorb what rain does fall, and runoff accelerates while underground water and springs are deprived of recharge. For these reasons this author is convinced that overgrazing and over-exploitation of Botswana's natural resources, rather than actual rainfall deficiency, are the main causes of drought. AN IMPROVED SEDIMENT DELIVERY MODEL FOR PIEDMONT FORESTS,
Georgia Univ., Athens. School of Forest Resources.
R. G. Burns.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139801, Price codes: A05 in paper copy, A01 in microfiche. Environmental Resources Center, Georgia Institute of Technology, Atlanta. Technical Completion Report No ERC 03-79, June 1979. 80 p, 6 Fig, 12 Tab, 26 Ref, 1 Append. OWRT A-053-GA(1).

Descriptors: *Sediment control, *Forest management, *Model studies, Georgia, Sediment transport, Erosion control, Watershed management, Soil stability, Soil moisture, Pine trees, Runoff, Rainfall, Lumber, Clear-cutting, Forest soils, Lumbering.

Two similar watersheds in the pine production area of the central Georgia piedmont were studied to develop an improved sediment delivery model for use as a management tool for forest harvesting and site preparation. Eight watershed segments were instrumented in the treated basin and four in the untreated control basin. The treated basin was commercially clearcut then prepared in two stages with drum roller choppers. Thirty-one sets of data were collected for rainfall, runoff, and fine sediment delivery. Other data collected include the occurrence, location, and condition of all bare soil in each area during each phase of harvesting and site preparation. the model, based in part on the 'universal soil loss equation' has three components: energy, site, and erosion hazard. Tested as indices of the energy component were the rainfall erosivity factor R, gross precipitation Pg, and the product of runoff volume and peak discharge rate Qvp. Soil erodibility K, watershed segment slope S, average sediment topographic slope length L, and gully density G were tested as site component indices. For the erosion hazard component total bare soil B, a new erosion hazard index W, and its approximation Wa were used. Several model combinations were tested and all were superior to previous models. Use of the W hazard index indicates that minimal bare soil and maximum distance to stream channels are important management concerns for forest harvest practices. (Seigler-IPA)

FILTRATION OF SEDIMENT BY SIMULATED VEGETATION II. UNSTEADY FLOW WITH NON-HOMOGENEOUS SEDIMENT,
Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
J. C. Hayes, B. J. Barfield, and R. I. Barnhisel.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 5, p 1063-1067, September-October 1979. 6 Fig, 2 Tab, 12 Ref.

Descriptors: *Sediment control, *Grasses, *Model studies, Mathematical models, Vegetation, Vegetation effects, Construction, Mining, Strip mines, Filters, Filtration, Deposition(Sediments), Sedimentation, Sedimentology, Grass sediment filters.

Reduction of sediment yield from disturbed areas such as strip mines and construction sites has continued to be a problem. Vegetal filtration has previously been recommended as a means of reducing the quantity of sediment which reaches the streams and rivers. Recent successful studies using uniformly sized particles in simulated erect vegetation have led to a series of equations which have been proposed to define the deposition within a grass filter. These equations utilized a spacing hydraulic radius to define the characteristic length applicable to the calculation of a Reynold's number. Prediction of mean velocity and channel bottom drag force were determined using this Reynold's number. These relationships were then used in conjunction with Einstein's sediment transport parameters for determination of total load transport in an artificial media. Barfield and others presented a model for making these predictions for steady flow conditions. These equations have now been extended to a continuity model for the prediction of the sediment profile with nonuniform particle sizes and time-varying inflows. In addition, some example calculations were shown in this report which demonstrate the sensitivity of the model to changes in various parameters under unsteady flow conditions. 5A. Identification Of Pollutants

METHODS FOR THE ASSESSMENT OF AQUEOUS ORGANIC MATERIALS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Science and Engineering.
D. W. Schnare, R. F. Christman, and F. K. Pfaender.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-140049, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Institute of the University of North Carolina, Raleigh, Rpt No 145, August 1979. 90 p, 4 Fig, 15 Tab. OWRT A-087-NC(1), 14-34-0001-7070.

Descriptors: *Organic pollutants, Organic compounds, XAD resins, Solute polarity, Flow rates, Elution solvent, Contaminants in water, Non-volatile organics, Hydrogen ion concentration, Resins, Water analysis, Analytical techniques.

XAD resins have been evaluated with a range of known organic compounds for possible use in a fractionation method intended to comprehensively analyze the organic contaminants present in water. Among the parameters investigated are the effects on the extraction efficiency of solute polarity, flow rate, pH, elution solvent, and the container in which the extraction and elution are carried out. These studies provide a basis for a suggested procedure using XAD resins that can be rapid and efficient for isolating a wide range of non-volatile contaminants from water. Using this method, high recoveries allow isolation and recovery of organics initially present in sub part per billion concentrations. Furthermore, water samples can be extracted in the field. Extraction of water and elution of the resin can take place in a single vessel, which eliminates many handling and concentration problems attendant with carbon adsorption methods. The batch desorption characteristic allows for greater recoveries, and spiking of the desorption solvent can provide an internal standard which aids accurate and reproducible quantitation, two significant improvements over other suggested resin methods. This method provides a solution of non-volatile organics in concentrations necessary for GLC or GC/MS identification and quantitation. (Kiger-NC)

A RESONANCE RAMAN METHOD FOR THE RAPID DETECTION, IDENTIFICATION AND QUANTITATION OF BACTERIA IN SEWAGE AND NATURAL WATERS,
Rhode Island Univ., Kingston. Dept. of Chemistry.
W. H. Nelson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-138522, Price codes: A02 in paper copy, A01 in microfiche. Rhode Island Water Resources Center, University of Rhode Island, Completion Report, 1979. 18 p, 4 Fig, 3 Tab, 24 Ref. OWRT B-078-RI(1).

Descriptors: *Spectroscopy, *Sewage bacteria, *Aquatic microorganisms, *Chemical analysis, Spectrometers, Fluorescence, Sanitary engineering, Water pollution sources, Pathogenic bacteria, Resonance, Coliforms, Water quality, Resonance Raman.

Resonance Raman spectroscopy was used to rapidly identify and quantify chromogenic bacteria in water. A rapid and reliable method such as this would be a valuable tool for testing for bacterial contamination in public water supplies as the currently used coliform standards are time consuming and in many cases nonspecific. A series of carotene-containing bacteria were studied including Agmanellum quadruplicatum, Coccochloris elabens, and Rhodopseudomonas palastris. A standard Spex Model 1401 spectrometer with a photon counting detection system was used with incident light at 514.5 and 488.0 nm supplied by a Model CR-2 argon ion laser. Line intensities and energies are presented. Two intense bands were found for specific, interpretable resonance Raman spectra. The spectra were simply obtained, of high quality, and are reproducible. The method will allow for the rapid identification of microorganisms in the presence of 'contaminants' such as sewage and water. (Seigler-IPA)
W80-03087

ENHANCEMENT OF LUMINOL CHEMILUMINESCENCE WITH HALIDE IONS,
Maine Univ. at Orono. Dept. of Chemistry.
D. E. Bause, and H. H. Patterson.
Analytical Chemistry, Vol 51, No 13, p 2288-2289, November 1979. 2 Tab, 6 Ref. OWRT B-016-ME(1).

Descriptors: *Bromides, *Chemical analysis, *Spectrophotometry, *Water analysis, Fuorescence, Chromium, Chlorides, Halides, Freshwater, Saline water, Fluorometry, Sea water, Water chemistry, Anions.

Improvements in the use of chemiluminescence analysis to detect trace Cr(III) in marine and freshwater environments are reported. This analysis is based upon the oxidation of luminol by hydrogen peroxide in basic aqueous solutions with Cr(III) as the catalyst. Several ions, C1(-), F(-), and SO4(2-) have been found to enhance chemiluminescence intensity, however, for the bromide ion intensity increase is eightfold and is proportional to Cr(III) concentration. Although the mechanism of this bromide enhancement is not clear it appears to be an ion-pairing phenomenom. Enhancement data were obtained using a flow system with two 20-ml plastic syringes. One syringe contained the Cr(III) sample and the other contained a solution of luminol and hydrogen peroxide. The solutins were mixed prior to entering a Perkin-Elmer MPF-44A Fluorescences Spectrophotometer for measurement of signal responses. With the use of bromide ion enhancement the detection limit for Cr(III) has been significantly lowered to 1.3 X 10 to the minus 10th power M and the enhancement is applicable to both fresh and marine water analysis. (Seigler-IPA)
W80-03094

SALMONELLA SP. HARBORED BY AQUATIC FAUNA AS INDICES OF FECAL POLLUTION,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
E. V. Morse, K. A. Gossett, and R. L. Lawton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-140064, Price codes: A04 in paper copy, A01 in microfiche. Technical Report No 127, January 1980. 59 p, 5 Fig, 22 Tab, 36 Ref, 1 Append. OWRT B-076-IND(5).

Descriptors: *Salmonella, *Water pollution source, *Indicator bacteria, Aerobic bacteria, Fish, Aquatic life, Bioindicators, Water quality, *Indices, Fecal pollution.

The presence of the bacteria Salmonella in the aquatic environment indicates fecal pollution. This study identifies salmonella as a useful and reliable index of contamination of bodies of water used for drinking, bathing, fishing, or aquatic recreational activities. Techniques for collecting water samples were developed. Eleven serotypes were found among 131 salmonella isolates when Wabash River (IND) native fish and fresh water mussels were cultured. Salmonellae were found capable of colonizing the intestinal tract of native fishes. Higher concentrations of salmonellae were found in fish intestinal tracts than were present in environmental water. Several serotypes were present in the fish which were not present in their habitat water. Increased eutrophy of the water decreased infection rates. However when bottom sediment was allowed to 'build up' increased infection rates were evident. Physiological stress increased piscine salmonella infection rates. It is concluded that Salmonella may be used as monitors of fecal pollution in the aquatic biosphere. The bacteria when present in native fishes, may be retrospective indices of fecal pollution. The presence of Salmonella in any body of water raises serious questions as to its safety, i.e. drinking and total body immersion, both for man and livestock. (Wiersma-Purdue)
W80-03173

BIOCHEMICAL SIGNIFICANCE OF ARSENICAL POLLUTANTS IN A POTABLE WATER SUPPLY,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Environmental Science.
S. D. Faust, and W. H. Clement.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-140031, Price codes: A02, in paper copy, A01 in microfiche. Final Technical Completion Report, Water Resources Research Institute, Rutgers University, January 1980. 18 p, 3 Fig, 7 Tab, 22 Ref. OWRT A-051-NJ(1), 14-34-0001-8032.

Descriptors: *Arsenic compounds, Aerobic conditions, Anaerobic conditions, Mud, Pollutant identification, Toxins, Contaminants, Contaminant release, Simulated reservoirs.

The essential results of this study are that greater percentages of arsenic were released from contaminated muds under anaerobic conditions (in the water phase) and at slightly faster rates than under aerobic conditions. In one of the experiments, exposure to sunlight appeared to catalyze the arsenic release under both aerobic and anaerobic conditions. The aerobic release of arsenic is an atypical condition. Greater releases of arsenic are typically from anaerobic conditions. Concurrent experiments on iron release from contaminated muds showed greater percentages of Fe2+ were released under anaerobic than under aerobic conditions. No firm conclusions were drawn. There are, however, strong indications that anaerobic conditions may yield greater quantities of arsenic compounds in the reduced valence state (+III) than aerobic conditions where the (+V) valence state would predominate. That the anaerobic chemistry of arsenic release may be linked to iron is suggested. The release of ferrous phosphate compounds from anaerobic lake sediments to overlying waters is documented quite well in the literature. Since the chemistries of arsenic and phosphate are similar, dissolution of ferrous arsenite compounds may account for both iron and arsenic release.

300 specimens of Salmo gairdneri, acclimated to running water from Lake Maggiore, were introduced, after one or two day starvation into experimental tanks containing water from Monate, Mergozzo, Maggiore (controls), Comabbio and Varese lakes, which present increasing trophic levels. By the end of the experiment (4 hr) the concentrations of several compounds (e.g. aminoacids, glycogen, glucose, lactate, malate and cyclic AMP) in the liver were assayed, along with the hemoglobin content of the skin mucus. Only alanine and glycogen levels departed from those reported in the literature for Salmo gairdneri. (Deal-EIS)

A STUDY OF THE DISTRIBUTION OF MERCURY IN THE VARIOUS COMPARTMENTS OF THE NORTH SEA AND SCHELDT ESTUARY ECOSYSTEMS,
Beheerseenheid Model Noordzee en Schelde Brussel, (Belgium).
W. Baeyens, G. Decadt, and I. Elskens.
Oceanologica Acta, Vol 2, No 4, p 447-457, 1979. 11 Fig, 7 Tab, 32 Ref.

Descriptors: *Mercury, *Path of pollutants, *Thermodynamic behavior, Ecosystems, Estuaries, Phytoplankton, Zooplankton, Bottom sediments, Physicochemical properties, Chemical reactions, Water chemistry, Heavy metals, *North Sea, *Tissue analysis, *Methylmercury, Scheldt Estuary.

The distribution of mercury in various compartments of the North Sea and Scheldt ecosystems was investigated. The experimental results showed that: (1) in the North Sea, the ratio of particulate to dissolved mercury in the water column was close to 1:1, while in the estuary (particularly in its upper portion) this ratio was much higher; (2) the mercury content of living organisms was higher in phyto- and zoo-plankton than in fish, although detrital matter still contained about five times more mercury than phytoplankton; and (3) the concentration of mercury in marine sediments was situated between those found in zooplankton and fish. Thermodynamic stability diagrams for aqueous and solid mercury compounds in seawater and brackish water provided valuable information for the interpretation of the observed mercury distribution. Under reducing conditions, mercury-sulphide compounds were predominant, in both water systems. These compounds play a very important role in the accumulation and release of mercury in sediments (the stable solid compound under reducing conditions, cinnabar, determines the mobility of mercury in the interstitial water), and in living organisms (the latter produce metallothioneins, which contain a large number of -SH groups and show high affinities for mercury). In combination with electrostatic forces these compounds probably also play a role in the process of adsorption of Hg C13-, which is theoretically the predominant

mercury compound in the North Sea and the major part of the Scheldt estuary, on suspended matter. (Deal-EIS)

TOXICITY TESTING IN THE UNITED KINGDOM FOR THE EVALUATION OF OIL SLICK DISPERSANTS,
Ministry of Agriculture, Fisheries and Food, Burnham-on-Crouch (England). Fisheries Lab.
M. G. Norton, F. L. Franklin, and R. A. A. Blackman.
In: Chemical Dispersants for the Control of Oil Spills, ASTM STP 659, L. T. McCarthy, Jr., G. P. Lindblom and H. F. Walter, Eds., American Society for Testing and Materials, p 18-34, 1978. 4 Fig, 6 Tab, 9 Ref.

Descriptors: *Toxicity, *Bioassay, *Methodology, Testing procedures, Analytical techniques, Oil spills, Oil, Organic compounds, Water pollution control, Shrimp, Mortality, *Dispersants, *Oil dispersants.

Until recently, the toxicity of dispersants approved for use in U.K. waters was evaluated by a static bioassay on the dispersant alone. Following the 1974 Dumping at Sea Act, dispersant evaluation methods were reviewed and dispersants are now licensed for sea (offshore) or for beach use, based on two tests to assess the environmental effect of the dispersant use. The 'sea' test assesses the toxicity to Crangon crangon of a chemically dispersed oil and compares it with the toxicity of the oil alone. Mortality is measured over a period of 100 min at an oil concentration of 1000 ppm. The 'beach' test assesses the toxicity of the dispersant alone to a typical intertidal organism, Patella vulgata, by spraying with dispersant and rinsing in a simulated tidal cycle. Mortalities are measured after 72 h and compared with those of an oil control. The rationale behind the development of these tests is described, together with the experimental results. The U.K. criteria for licensing products on the basis of these test results are also discussed. (Deal-EIS)
W80-03214

ACUTE AQUATIC TOXICITY AND DISPERSING EFFECTIVENESS OF OIL SPILL DISPERSANTS: RESULTS OF A CANADIAN OIL DISPERSANT TESTING PROGRAM (1973 TO 1977),
Environmental Protection Service, Halifax (Nova Scotia).
K. G. Doe, and P. G. Wells.
In: Chemical Dispersants for the Control of Oil Spills, ASTM STP 659, L. T. McCarthy, Jr., C. P. Lindblom and H. F. Walter, Eds., American Society for Testing and Materials, p 50-65, 1978. 5 Tab, 56 Ref.

Descriptors: *Oil spills, *Toxicity, *Bioassay, Oil, Organic compounds, Rainbow trout, Killifishes, Lobsters, Water pollution control, Water quality standards, Surfactants, Lobsters, *Dispersants, *Oil dispersants, *Crude oil.

An oil spill dispersant testing program was initiated in 1973 to evaluate the toxicity and dispersing effectiveness of dispersants submitted to Fisheries and Environment Canada for approval prior to use in Canadian waters. Screening toxicity tests with rainbow trout (Salmo gairdneri) were performed initially on 19 dispersants. Thirteen were considered sufficiently nonacutely toxic to justify further evaluation using methods and criteria of the Canadian Guidelines on the use and acceptability of oil spill dispersants. The dispersants BP1100X, Corexit 8666, Drew Chemical OSE 71, Drew Chemical OSE 72, Oilsperse 43, and Sugee 2 passed both the toxicity and effectiveness criteria and were placed on the Canadian standard list of acceptable oil spill dispersants. Acute lethal toxicity tests with BP1100X and Sugee 2 showed that rainbow trout in fresh water were more sensitive than two marine fish, Fondulus heteroclitus and Menidia menidia, while fourth-stage larval lobsters, Homarus americanus, were the least sensitive. EFFECT OF A CHEMICAL DISPERSANT ON MICROBIAL UTILIZATION OF PETROLEUM HYDROCARBONS,
Rhode Island Univ., Kingston. Dept. of Plant Pathology-Entomology.
R. W. Traxler, and L. S. Bhattacharya.
In: Chemical Dispersants for the Control of Oil Spills, ASTM STP 659, L. T. McCarthy, Jr., G. P. Lindblom and H. F. Walter, Eds., American Society for Testing and Materials, p 181-187, 1978. 3 Fig, 1 Tab, 6 Ref.

Descriptors: *Oil, *Microbial degradation, *Toxicity, Oil spills, Organic compounds, Bacteria, Metabolism, Biochemical oxygen demand, Path of pollutants, Sea water, Water pollution control, *Dispersants, *Oil dispersants, *Crude oil, *Corexit.

The dispersant Corexit 9527 was found to enhance bacterial metabolism of Kuwait and South Louisiana crude oils as well as pure hydrocarbons in nonmechanically agitated seawater systems. Oxygen depletion, measured by a modification of the Biological Oxygen Demand (BOD) method, was used to determine the rate of substrate and mixed substrates oxidation by raw seawater populations of bacteria. This method demonstrated significantly increased oxidation of crude oil treated with dispersants. Mineralization studies, with 14C labeled hydrocarbon, substantiated the BOD results and also indicated that alkanes were metabolized prior to aromatic components in crude oils. (Deal-EIS)
W80-03216

THE ROLE OF ZOOPLANKTON FECAL PELLETS IN THE SEDIMENTATION OF POLYCYCLIC AROMATIC HYDROCARBONS IN DABOB BAY, WASHINGTON,
Washington Univ., Seattle. Dept. of Oceanography.
F. G. Prahl, and R. Carpenter.
Geochimica et Cosmochimica Acta, Vol 43, p 1959-1972, 1979. 7 Fig, 4 Tab, 48 Ref.

Descriptors: *Path of pollutants, *Aromatic compounds, *Zooplankton, Bottom sediments, Seasonal, Runoff, Water chemistry, Water pollution sources, Diatoms, Phytoplankton, Chemical analysis, Gas chromatography, Lead radioisotypes, Radioactive dating, Aluminum, Dabob Bay, Washington, *Fecal pellets.

Polycyclic aromatic hydrocarbon (PAH) compositions were determined in plankton, sediment-trap-collected particulate material and sediment cores from Dabob Bay using a high performance liquid chromatographic/fluorescence technique. The annual flux of individual PAH measured in a series of sediment traps was compared with the flux of corresponding compounds determined from 210Pb dated bottom sediments. Systematic seasonal variations in the fluxes and concentrations of PAH, Al and organic carbon in the trap-collected particulates and seasonally collected plankton were also investigated to determine whether or not PAH are associated with either terrestrial or marine-derived materials. Concentrations of all PAH studied increased tenfold within the last 80-100 yr of sediment deposition, except for perylene which displayed a reasonably constant concentration profile. This suggests at least two sources contribute to the observed sedimentary PAH compositions in Dabob Bay, i.e., anthropogenic combustion and a natural source. Plankton and sediment trap-collected particulates contained PAH mixtures qualitatively similar to underlying surface sediments. Microscopic examination indicated fecal pellets were the major form of particulate material in the sediment traps. The fecal pellets collected in the sediment trap time series quantitatively account for essentially 100% of the PAH fluxes measured in the 210Pb dated sediments, implying zooplankton fecal pellets control the removal of PAH to Dabob Bay sediments. (Deal-EIS)

INITIAL TESTING OF A RECENT BIOLOGICAL MONITORING CONCEPT,
Virginia Polytechnic Institute and State Univ., Blacksburg. Center for Environmental Studies.
D. Gruber, J. Cairns, Jr., K. L. Dickson, A. C. Hendricks, and W. R. Miller, III.
Journal of the Water Pollution Control Federation, Vol 51, p 2744-2751, 1979. 7 Fig, 18 Ref.

Descriptors: *Bioindicators, *Sunfishes, *Bioassay, Monitoring, Industrial wastes, Fish physiology, Automation, Automatic control, Computers, Research equipment, Electrical equipment, Analytical techniques, Chlorination, Water chemistry, Oil spills, Chemical wastes.

The development of a recent concept of biological monitoring for continuously assessing industrial effluents is presented. Bluegill sunfish, Lepomis macrochirus, are used as biological sensors, and a small on-line computer facilitates the monitoring of the ventilatory rates of the fish, thereby automating the system. Chemical and physical monitors are also connected to the computer system, and an automatic refrigerated water sampler has been incorporated to facilitate more advanced chemical analysis. For the purpose of comparing the sensitivity of the present biological monitoring system with that of more conventional methods of toxicity testing, a continuous-flow acute bioassay unit is being included. Initial testing of the biomonitoring unit is being included. Initial testing of the biomonitoring system has demonstrated its practicality by incorporating a standard mixture from the petroleum industry (arbitrary reference mixture), a sodium hypoclorite solution, and chlorinated tapwater as test effluents. EFFECT OF ENVIRONMENTAL SALINITY OF HAEMOLYMPH AND TISSUES OF MUSSELS,
Akademiya Nauk SSSR, Leningrad. Lab. of Comparative Biochemistry of Inorganic Ions.
I. A. Skul'skii, I. V. Burovina, N. B. Pivovarova, T. I. Ivanova, and A. V. Lapin.
The Soviet Journal of Marine Biology, Vol 5, p 28-33, 1979. 3 Fig, 2 Tab, 12 Ref.

Descriptors: *Salinity, *Mussels, *Ions, Sodium, Animal physiology, Animal metabolism, Potassium, Habitats, Adaptation, Membrane processes, Osmosis, *Tissue analysis.

The content of ions in the tissues of mussels inhabiting seas with different salinities is investigated. The concentration of Na+ in the haemolymph of mussels and environment is always the same, while the distribution coefficient of K+ of haemolymph/environment increases as the salinity decreases. At the same time the absolute values of intracellular concentrations of K+ and Na+ in the muscles and nerve cells drop and the concentration gradients of cell/haemolymph change within narrow limits. (Deal-EIS)

INFLUENCE OF CERTAIN WASTE WATERS CONTAINING AMMONIA, UREA AND METHANOL ON UNICELLULAR MARINE ALGAE (IN FRENCH),
Institut Romania de Recherches Marines, Constantsa.
P-E. Mihnea.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique de la Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 465-469, 1979. 4 Fig, 2 Tab, 2 Ref, (English abstract).

Descriptors: Water pollution effects, *Nutrients, *Phytoplankton, *Laboratory tests, Bioassays, *Ammonia, *Urea, Methanol, Domestic wastes, Industrial wastes, Laboratory tests, Algae, Phytoplankton, Nitzschia, Skeletonena, Chlamydomonas.

The results of experiments with waste waters (containing: methanol, ammonium, urea, and mixtures of these) on some unicellular algae are given (Nitschia and Chlamydomonas). The destructive or stimulating effects are presented as LT50, T90, recovering capacity, cells division, and have an essential specific feature. Ammonia is more toxic to

the algae than methanol. In very low concentrations these substances stimulate the division of the algae. In nature these substances stimulate the growth of algal blooms. (Katz-EIS)

LEVELS OF METAL POLLUTANTS IN SEDIMENTS AND BIOTA OF THE GULF OF TRIESTE: A LONG TERM SURVEY,
Trieste Univ. (Italy). Inst. of Hygiene.
L. Majori, G. Nedoclan, G. B. Modonutti, and F. Davis.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 237-243, 1979. 1 Fig, 6 Tab, 3 Ref.

Descriptors: *Metals, *Monitoring, *Aquatic environment, *Bioindicators, Trace elements, *Cadmium, *Cobalt, *Chromium, *Copper, *Iron, *Mercury, Manganese, Nickel, *Lead, *Zinc, Mussels, Water chemistry, Bottom sediments, Marine fish, Mullets, *Arsenic, *Tissue analysis, *Bioaccumulation.

Given is a summary of observations made over several years regarding the content of trace elements (As, Cd, Co, Cr, Cu, Fe, Hg, Mn, Ni, Pb, Zn) in the components of the marine environment (e.g. sea water, sediments, and various species of fish). Our studies of contamination levels show that Mytilus galloprovincialis LmK is a practical and simple research tool for monitoring marine metal pollution. It is suggested that these 'biological samplers' be used on a large scale, so as to make it possible to draw a map of metal pollution. (Deal-EIS)

TRACE ELEMENTS IN PELAGIC ORGANISMS AND A PELAGIC FOODCHAIN OF THE AEGEAN SEA,
Democritus Nuclear Research Center, Athens (Greece). Radioanalytical Lab.
C. Papadopoulou, D. Zafiropoulos, I. Hadjistelios, M. Vassilaki-Grimani, and C. Yannopoulos.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 231-232, 1979.

Descriptors: *Food chains, *Path of pollutants, *Trace elements, *Zinc, *Cobalt, *Cesium, Chemical analysis, Marine fish, Plankton, Water chemistry, Metals, *Selenium, *Rubidium, *Vanadium, *Arsenic, *Tissue analysis, *Biomagnification.

Plankton, Euphasia kronii, and the pelagic fish species Trachurus mediterraneus and Scomber japonicus colias were analysed for the elements As, V, Se, Co, Cs, Zn and Rb. Concentrations of As, Zn, Co, Se, and Rb in Scomber compared well to those in Trachurus whereas V values were one order of magnitude higher in Trachurus. Assuming that the plankton samples of different size and Trachurus represent 5 different levels of a pelagic food chain, no trend of food chain magnification was observed. (Deal-EIS)
W80-03229

POLLUTION MONITORING OF ELEVEN TRACE ELEMENTS IN THREE MARINE ORGANISMS FROM SARONIKOS GULF, GREECE,
Democritus Nuclear Research Center, Athens (Greece). Radioanalytical Lab.
A. P. Grimanis, C. Papadopoulou, D. Zafiropoulos, M. Vassilaki-Grimani, and N. Tsimenidis.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 233-234, 1979. 1 Fig.

Descriptors: *Trace elements, Monitoring, *Water chemistry, *Cadmium, *Cobalt, *Chromium, *Cesium, *Iron, *Mercury, *Zinc, *Mullets, Mussels, Chemical analysis, Water quality standards, Water pollution effects, *Silver, *Rubidium, *Selenium, *Tissue analysis, *Antimony, Greece, Saronicos Gulf.

Levels of eleven trace elements (Ag, Cd, Co, Cr, Cs, Fe, Hg, Rb, Sb, Se, and Zn) have been determined by neutron activation analysis in the muscle of Mullus barbatus and Parapenaeus longirostris as well as in the whole body of Mytilus galloprovincialis from Saronicos Gulf, Greece, during a two-year period (1975-1977). Only one Hg value (570 ug/kg wet weight) was found to be slightly higher than the WHO maximum permissible level. No significant seasonal or geographic variations were observed except for P. longirostris specimens collected during summer 1976 from a single station. No pollution effects were noted. (Deal-EIS)
W80-03230

TRACE METALS AND ORGANOCHLORINE RESIDUE CONTENT OF MULLIDAE FAMILY FISHES AND SEDIMENTS IN THE VICINITY OF ERDEMLI (ICEL), TURKEY,
Middle East Technical Univ., Ankara (Turkey). Dept. of Marine Science.
T. I. Balkas, I. Salihoglu, G. Tuncel, S. Tugrul, and G. Ramelow.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 159-163, 1979. 2 Tab, 15 Ref.

Descriptors: *Heavy metals, *Chlorinated hydrocarbon pesticides, *Mullets, Gas chromatography, Spectrometry, Chemical analysis, *Mercury, *Copper, *Cadmium, *Zinc, *Lead, *DDT, DDD, DDE, Aldrin, Dieldrin, *Polychlorinated biphenyls, Pesticide residues, Bottom sediments, Turkey, Erdemli, *BHC, *Heptachlor, *Tissue analysis.

The organochlorine residue content of three members of the mullidae family, i.e., Mullus barbatus, Mullus surmuletus and Upenus moluccensis caught in the vicinity of Erdemli has been investigated with the aid of gas chromatography. Some trace metals such as Hg, Cu, Cd, Zn, and Pb in the same species have also been investigated with atomic absorption spectrometry. Sediment samples of the area were analysed and their organochlorine residue and trace metal contents determinated. (Deal-EIS)
W80-03231

TRACE ELEMENTS IN MESOPELAGIC AND SOME COASTAL FISH FROM THE ADRIATIC,
Nuklearni Inst. Jozef Stefan, Ljubljana (Yugoslavia).
P. Stegnar, L. Kosta, V. Ravnik, J. Stirn, and A. R. Byrne.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 235-236, 1979. 2 Tab, 5 Ref.

Descriptors: *Trace elements, *Marine fish, Chemical analysis, *Copper, *Mercury, *Manganese, *Zinc, Water chemistry, Heavy metals, Path of pollutants, *Arsenic, *Antimony, *Tissue analysis, *Arsenic, *Antimony, *Selenium, *Adriatic Sea.

Trace elements (As, Cu, Hg, Mn, Sb, Se, Zn) were determined in 6 species of mesopelagic fish (Argyropelecus hemigymnus, Diaphus rafinesqui, Gonichtys coccoi, Maurolicus pennanti, Notoscopelus elongatus, Scopelus benoiti) and 2 selected coastal fish samples (Boops boops, Pagellus erythrinus) from different sampling stations from the Adriatic. When compared to the trace element contents found in coastal fish, it was evident that only Hg concentrations were higher in coastal fish, while the opposite situation was found for Zn. The concentration level for the other elements was nearly the same in mesopelagic and coastal fish specimens. (Deal-EIS)
W80-03233

MERCURY CONCENTRATIONS IN PELAGIC FISHES (ANCHOVY, MACKEREL AND SARDINE) FROM THE ITALIAN COAST AND STRAIT OF GIBRALTAR,
Siena Univ. (Italy). Lab. di Idrobiologio.
F. Baldi, A. Renzoni, and M. Bernhard.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 251-254, 1979. 4 Fig, 4 Ref.

Descriptors: *Mercury, *Marine fish, Chemical analysis, Habitats, Water chemistry, Geochemistry, Path of pollutants, Coasts, Heavy metals, Growth rates, *Anchovy, *Engraulis, *Scomber, *Sardina, *Mediterranean Sea, *Tissue analysis, *Bioaccumulation, *Italy.

Mercury body burden in Engraulis encrasicolus, Scomber scomber, S. japonicus and Sardina pilchardus caught in Italian coastal waters were compared with the body burden of specimens from the same species obtained from varied locations in the Strait of Gibraltar. The Hg/weight ratio was significantly smaller in the fishes from Strait of Gibraltar than in the fishes from the Italian coast. Because of their pelagic habitat the specimens from the Italian coast cannot be contaminated from anthropogenic sources. Their higher Hg body burden must be due to the higher natural Hg concentration in the marine and terrestrial environment near geochemical Hg anomalies. In Mediterranean fishes the Hg body burden was about twice that of the specimens of the same size from the Atlantic. Similar higher body burden was found in Mediterranean tuna which prey on these pelagic fishes. (Deal-EIS)
W80-03236

MONITORING OF CHLORINATED HYDROCARBONS IN WATER AND SEDIMENTS OF THE NORTH ADRIATIC COASTAL WATERS,
Institut Rudjer Boskovic, Rovinj (Yugoslavia). Center for Marine Research.
N. Picer, and M. Picer.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 133-136, 1979. 2 Fig, 4 Ref.

Descriptors: *Pesticide residues, *Polychlorinated biphenyls, *Monitoring, Chlorinated hydrocarbon pesticides, DDT, Water chemistry, Bottom sediments, Chemical analysis, Path of pollutants, Analytical techniques, *Adriatic Sea.

Persistent chlorinated hydrocarbons in more than 50 water and sediment samples were analysed over a two-year period (1977-78). Analyses were performed on subsurface water samples collected at a depth of 1 m and on samples collected from several surface slicks by means of a Garrett net. Sediment samples were collected by grab sampler. The results of monitoring of chlorinated hydrocarbons in sea-water samples are discussed from the viewpoint of the analytical difficulties. Some explanations concerning the influence of local pollution sources on the level of chlorinated hydrocarbons in coastal waters of the North Adriatic are given. (Deal-EIS)
W80-03237

MONITORING OF CHLORINATED HYDROCARBONS IN BIOTA AND SEDIMENTS OF SOUTH ADRIATIC COASTAL WATERS,
Biological Inst., Dubrovnik (Yugoslavia).
D. Vilicic, N. Picer, M. Picer, and B. Nazansky.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 143-146, 1979. 2 Fig, 5 Ref.

Descriptors: *Pesticide residues, *Monitoring, *Aquatic life, *DDT, DDE, Dieldrin, *Polychlorinated biphenyls, Chlorinated hydrocarbon pesticides, Gas chromatography, Mollusks, Crustaceans, Fish populations, Plankton, Mussels, Sediments, Mullets, Crabs, Oysters, *Adriatic Sea, *Tissue analysis.

During a two year-period of monitoring of chlorinated hydrocarbons in South Adriatic coastal waters, 55 biota (molluscs, crustaceans, fishes, plankton) and sediment samples were collected. Determinations of DDT, TDE, DDE, dieldrin, and PCBs were performed by means of gas chromatography. These data are related to possible sources of pesticide applications. (Deal-EIS)

ACCUMULATION AND DISTRIBUTION OF HEAVY METALS IN SOME MARINE ORGANISMS IN THE BAY OF IZMIR AND IN AEGEAN COASTS,
Ege Univ., Izmir (Turkey). Dept. d'Oceanographique Biologique.
H. Uysal.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 213-217, 1979. 2 Fig, 2 Tab, 10 Ref.

Descriptors: *Heavy metals, *Spatial distribution, *Fish populations, *Mercury, *Cadmium, *Copper, *Cobalt, *Chromium, *Manganese, *Zinc, *Iron, *Lead, *Mussels, Mullets, Crabs, Seasonal, Fish migrations, Path of pollutants, Shrimp, *Tuna, *Tissue analysis, Marine fish, Turkey, *Mediterranean Sea, Bay of Izmir.

Concentrations of heavy metals (Hg, Cd, Cu, Co, Cr, Mn, Zn, Fe, Pb) have been measured in Mytilus galloprovincialis, Penaeus kerathurus, Mullus barbatus, Mullus surmuletus, Mugil sp., Thunnus thynnus, Carcinus mediterraneus, over their range of distribution in the bay of Izmir and Aegean coast (Turkey). Mugil sp. and Mullus sp. are most abundant along the coasts of the Aegean. M. galloprovincialis is not found in the south part of Izmir Bay and all the southern part of Turkey. P. kerathurus is found in relatively normal amounts along the Aegean coasts; but in some localities it is very rare. Thunnus thynnus thynnus are most abundant during migration seasons along the Aegean coasts. A comparison of the concentrations of heavy metals in these marine animals which represent different environmental conditions has been determined seasonally for each locality. According to our results the heavy metals concentration of C. mediterraneus was higher than the other species mentioned and the concentration of elements vary according to species, locality and seasons of the year. (Deal-EIS)
W80-03239

THE EFFECT OF DDT AND HEXACHLORANE ON ASSIMILATION AND OUTFLOW OF 14C IN PHRAGMITES COMMUNIS,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
T. I. Shokod'ko, A. I. Merezhko, and A. I. Lyashenko.
Hydrobiological Journal, Vol 14, No 4, p 91-95, 1978. 1 Fig, 2 Tab, 3 Ref.

Descriptors: *Pesticide kinetics, *Aquatic plants, *Plant physiology, *DDT, Carbon radioisotopes, Radiochemical analysis, Tracers, Photosynthesis, Toxicity, Path of pollutants, Chlorinated hydrocarbon pesticides, Root systems, *Hexachlorane.

The assimilation of 14CO2 by reeds is reduced under the influence of DDT and hexachlorane. That the pesticides have a specific effect on the reaction of photosynthesis and a general toxic effect may be suggested from the shape of the curves showing the dependence of the rate of assimilation of 14CO2 on pesticide concentration. The reed is more resistant to DDT than to hexachlorane. A redistribution of 14C occurred in the organs of the reed under the influence of the organic chlorine pesticides. As the concentrations of the preparations increased there was a rise in the absolute amount of radiocarbon flowing into the roots; the mean rate of outflow into the roots is also increased against the background of an increase in the relative outflow of 14C-labeled assimilates. Intensification in the outflow of assimilates into the roots in the presence of DDT and hexachlorane is a defense reaction of the reed to the action of the toxic agent. (Deal-EIS)

HEAVY METALS AND CHLORINATED HYDROCARBONS IN PELAGIC ORGANISMS FROM THE OPEN MEDITERRANEAN SEA,
International Lab. of Marine Radioactivity, Monte Carlo (Monaco). Oceanographic Museum.
S. W. Fowler, J. La Rosa, Y. Unlu, B. Oregioni, and J. P. Villeneuve.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 Novembre 1978, Antalya, Turkey, p 155-158, 1979. 9 Ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Heavy metals, *Aquatic environment, Trophic levels, Chemical analysis, Pesticide residues, Polychlorinated biphenyls, DDT, Zinc, Iron, Cobalt, Cesium, Mercury, Plankton, Food chains, Mediterranean Sea, *Tissue analysis, *Tuna, *Arsenic, *Vanadium, *Silver, *Rubidium, *Antimony, *Scandium.

During 1977 pelagic organisms ranging in size from microplankton to tuna were sampled throughout the Mediterranean and analysed for selected heavy metals and chlorinated hydrocarbons. Wherever possible, zooplankton and nekton were sorted into species in order to aid in determining spatial and temporal trends in contaminant levels. Although the data are far from complete for all species, results to date for both categories of pollutants indicate that levels in open Mediterranean organisms in most cases are similar to those reported for pelagic species from other oceanic regions. SOME OBSERVATIONS ON THE REPRODUCTION AND EMBRYONIC DEVELOPMENT OF FIVE SPECIES OF FISH KEPT IN EXPERIMENTAL RADIOACTIVE WATER BODIES,
Akademiya Nauk SSSR, Moscow. Inst. of Evolutionary Morphology and Animal Ecology.
S. P. Muntyan.
Journal of Ichthyology, Vol 18, No 6, p 1033-1038, 1978. 2 Tab, 34 Ref.

Descriptors: *Toxicity, *Strontium radioisotopes, *Embryonic growth stage, Strontium, Cesium, Fish physiology, Animal growth, Animal pathology, Radioactivity effects, Aquaculture, Mortality, *Teratogens, *Tissue analysis.

The reproduction and embryonic development of pike (Esox lucius), perch (Perca fluviatilis), roach (Rutilus rutilus), crucian carp (Carassius carassius) and common wild goldfish (Carassius auratus gibelio) inhabiting radioactive water (Sr-90 and Cs-137) were studied. Normal embryos of all five species survived until complete absorption of the yolk. Following that period abnormalities were noted, including: curvatures of the body; deformation and incomplete development of myotomes; 'dropsy' of the pericardial cavity and the body cavity; and, disturbances of the cardiovascular system. The feasibility of raising fish in low-level radioactively contaminated water is also discussed. (Deal-EIS)
W80-03244

ON THE CORRESPONDENCE OF DATA ON THE INCUBATION OF FISH EGGS IN SOLUTIONS OF STRONTIUM-90 -- YTTRIUM-90 OF VARYING ACTIVITY UNDER LABORAROTY CONDITIONS AND IN NATURAL WATERS,
Vserossiiskii Nauchno-Issledovatelskii Inst. Prudpvpgp Rybnogo Khozyaistva, Moscow (USSR).
V. L. Pechkurenkov, and G. L. Pokrovskaya.
Journal of Ichthyology, Vol 18, No 6, p 995-1004, 1978. 2 Fig, 2 Tab, 26 Ref.

Descriptors: *Fish eggs, *Strontium radioisotopes, *Radiation, Cesium, Radioactivity effects, Toxicity, Size, Fish physiology, Mortality, Genetics, Growth stages, Mode of action, Chromosomes, Sediments, *Yttrium radioisotopes.

Data are presented on the incubation of fish eggs under laboratory conditions in solutions of strontium-90 -- yttrium-90 with a varying activity and in natural waters artificially polluted with strontium-90 -- yttrium-90 and cesium-137. Ways of calculating the correction coefficients for the geometry (sizes) of the eggs when calculating the doses are given. The dose load per egg which is incubated in solutions of strontium-90 -- yttrium-90, prepared from tap water, is determined by the level of accumulation of these radionuclides by the developing egg, while the dose load obtained by the developing egg in a natural body of water, will be determined by the extent of silting up of the egg and the coefficient of radionuclide accumulation in the ooze. (Deal-EIS)

PHYSIOLOGICAL-BIOCHEMICAL DATA ON EXPERIMENTAL INTOXICATION OF FISH WITH 'YALAN',
Kaspiiskii Nauchno-Issledovatelskii Inst. Rybnogo Khozyaistva, Astrakhan (USSR).
K. K. Vrochinskiy, and G. V. Zemkov.
Journal of Ichthyology, Vol 18, No 6, p 1004-1009, 1978. 1 Fig, 3 Tab, 22 Ref.

Descriptors: *Herbicides, *Toxicity, *Carp, Larval growth stage, Mortality, Bioassay, Lethal limit, Mode of action, Thiocarbamate pesticides, Fish behavior, Amino acids, Pesticide toxicity, Fish physiology, Animal metabolism, *Yalan, *Blood chemistry, *Glucose, *Tissue analysis.

The limits of the toxicity of the herbicide 'yalan' for 8 day old larvae of the carp, Cyprinus carpio were established. At the moment of intoxication the motor activity is decreased in second year carp with simultaneous increase in the amount of ammonia, urea and hydroperoxides of the lipids in the dorsal white muscle. The amount of glucose in the blood is simultaneously reduced. Herbicide concentrations in water within the limits of 4.5-72 mg/l are acutely toxic for the young of the carp. 2.2 mg/l or less of 'yalan' should be considered as subacute or chronic concentrations. W80-03251

POLYCYCLIC AROMATIC HYDROCARBON CARCINOGENS IN COMMERCIAL SEAFOODS,
British Columbia Cancer Research Center, Vancouver.
B. P. Dunn, and J. Fee.
Journal of the Fisheries Research Board of Canada, Vol 36, p 1469-1476, 1979. 4 Tab, 32 Ref.

Descriptors: *Pollutant identification, *Commercial fish, *Commercial shellfish, Crab, Shrimp, Lobster, Mollusks, Clams, Mussels, Salmon, Trout, Aromatic compounds, Poisons, Creosote, Chemical wastes, Industrial wastes, Gas chromatography, Public health, *Tuna, *Cod, *Sole, *Tissue analysis, *Carcinogens, *Benzo(a)pyrene.

Fresh and processed commercial seafoods were analyzed for the polycyclic aromatic hydrocarbon carcinogen benzo(a)pyrene using a thin-layer chromatographic separation technique and quantitation by fluorescence. Commercial samples of vertebrate fish did not contain detectable levels, except where fish were packed with vegetable oil, an exogenous source of carcinogens. Levels in most shellfish samples were generally less than 10 nannog/g wet weight, but occasional samples contained up to 36 nannog/g. Crab and shrimp samples contained little or no benzo(a)pyrene (ND to 0.5 nannog/g). Commercial lobsters contained 0.8 to 7.9 nannog/g. The source of contamination of lobsters was further investigated, utilizing high pressure liquid chromatography to measure 13 polycyclic aromatic hydrocarbon isomers. Freshly caught lobsters had less than 1 nannog/g benzo(a)pyrene. Lobsters which had been kept in a commercial tidal pound constructed of creosoted timber contained highly elevated levels of benzo(a)pyrene and other carcinogenic hydrocarbons, including chrysene, benzo(a)anthracene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene. The maximum level of benzo(a)pyrene was 2300 nannog/g wet weight in digestive gland, and 281 nannog/g in edible tail meat. These levels are substantially higher than previously reported for

any foodstuff, and are most probably attributable to creosote contamination during impoundment. (Deal-EIS)
W80-03252

ASSIMILATION EFFICIENCY OF DIETARY METHYLMERCURY BY NORTHERN PIKE (ESOX LUCIUS),
Montana State Univ., Bozeman. Dept. of Biology.
G. R. Phillips, and R. W. Gregory.
Journal of the Fisheries Research Board of Canada, Vol 36, p 1516-1519, 1979. 2 Tab, 19 Ref.

Descriptors: *Mercury, *Path of pollutants, *Pikes, Carp, Predation, Growth stages, Fish physiology, Trophic level, Heavy metals, Fish diets, *Tissue analysis, *Bioaccumulation, *Methylmercury.

Northern pike (Esox lucius) retained an average of 19% (range 6-31%) of the methylmercury which they ingested during consumption of young-of-the-year carp (Cyprinus carpio) collected from a pond; carp accumulated methylmercury naturally while in the pond. The total amount of mercury in pike increased with time (up to 42d) but concentration in the tissue decreased due to growth dilution; duration of ingestion did not influence efficiency of methylmercury assimilation. This value (19%) is considerably lower than most efficiencies reported in the literature, demonstrating that methylmercury in this forage fish is less readily available to a predator fish than previous studies implied. (Deal-EIS)

WAX ESTERS IN THE MARINE ENVIRONMENT: ORIGIN AND COMPOSITION OF THE WAX FROM BUTE INLET, BRITISH COLUMBIA,
Skidaway Inst. of Oceanography, Savannah, GA.
R. F. Lee, and J. C. Nevenzel.
Journal of the Fisheries Research Board of Canada, Vol 36, p 1519-1523, 1979. 2 Tab, 29 Ref.

Descriptors: *Copepods, *Pollutant identification, *Lipids, Organic compounds, Chemical analysis, Chromatography, Animal physiology, Biochemistry, Mortality, Seasonal, Winter, Zooplankton, Bute Inlet, British Columbia, *Wax esters.

During severe winters large amounts of a solid lipid accumulate on the water surface and on the shores of Bute Inlet, a deep fjord on the mainland of British Columbia. Chromatographic analyses show that this wax consists chiefly of wax esters (48%), with minor amounts of hydrocarbons (4%) and triacylglycerols (6%). Dominant among the zooplankton in this inlet is the copepod Calanus plumchrus, which also is rich in wax esters (40-50% of dry weight). Except for the lack of polyunsaturation in Bute Inlet wax there is a close similarity between the wax ester, alcohol, and fatty acid compositions of C. plumchrus and Bute Inlet wax. The major hydrocarbon of both is pristane. We hypothesize that Bute Inlet wax is produced by some major change in water conditions which cause a massive kill of copepods. At winter temperatures this lipid is a solid and as such may accumulate on the beach. Copepods are the likely source for the wax esters in slicks and sediments reported from oceanic areas throughout the world. (Deal-EIS)

ACCUMULATION AND EXCRETION OF 95ZR AND 95NB BY COMMON GOBY (ACANTHOGOBIUS FLAVIMANUS),
National Inst. of Radiological Sciences, Nakaminato (Japan). Div. of Marine Radioecology.
Y. Suzuki, M. Nakahara, and T. Ueda.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 45, No 10, p 1293-1298, 1979. 7 Fig, 2 Tab, 20 Ref.

Descriptors: *Radioisotopes, *Absorption, *Marine fish, Radiochemical analysis, Tracers, Path of pollutants, Fish physiology, Animal metabolism, Fallout, Radioactive wastes, Nuclear powerplants, *Bioaccumulation, *Tissue analysis, *Depuration, *Goby-fish, *Niobium radioisotopes, Zirconium radioisotopes.

In order to gain more information on 95Zr and 95Nb accumulation and excretion by marine fish, a laboratory study was undertaken using common goby. Radioactivity of 95Zr and 95Nb in the tissues or organs was simultaneously measured and readily distinguished by a high resolution detector. More than 60% of both total body burden of 95Zr and 95Nb was concentrated in the viscera (mainly digestive tracts) in spite of the small weight per cent (1.3%). The concentration factors of 95Zr and 95Nb on the 14th day after exposure were 34 and 42 for viscera; however, those were estimated to reach 70 and 83, respectively, if the fish were reared for a month under a constant level of radioactivity in sea water. The turnover rate for viscera was 0.0081 for 95Zr and 0.0018 for 95Nb, and the biological half-life was 85 days for 95Zr and 385 days for 95Nb, respectively. (Deal-EIS)

A FAST INDICATOR FOR DETECTING GROSS POLLUTION BY HAZARDOUS CHEMICALS,
Auckland Regional Authority, (New Zealand). Water Lab.
T. L. Shaw.
New Zealand Journal of Marine and Freshwater Research, Vol 13, No 3, p 393-394, 1979. 1 Tab, 4 Ref.

Descriptors: *Bioindicators, *Rainbow trout, *Chemical wastes, Copper compounds, Poisons, Monitoring, Mortality, Water quality, Fish physiology, Animal metabolism, Fish behavior, Analytical techniques, *Cyanides.

Median survival, 10% mortality, and 10% turnover times of rainbow trout, Salmo gairdneri Richardson, were compared in solutions containing copper or cyanide ions. For all concentrations of poisons (0.5, 1.0, and 2.0 g/cubic meter of copper as Cu2+ and 0.3, 0.5, 1.0, and 5.0 g/cubic meter of cyanide, as KCN), the times for turnover were the least. These were short enough (4.5-96 min) to be of use in monitoring waters which are being abstracted by water treatment plants. The method may be generally applicable for detection of gross forms of pollution by hazardous chemicals. (Deal-EIS)

INDICATORS OF PHOSPHORUS AND NITROGEN DEFICIENCY IN FIVE ALGAE IN CULTURE,
Department of Fisheries and Marine Services, Winnipeg (Manitoba). Freshwater Inst.
F. P. Healey, and L. L. Hendzel.
Journal of the Fisheries Research Board of Canada, Vol 36, No 11, p 1364-1369, 1979. 7 Fig, 16 Ref.

Descriptors: *Aquatic algae, *Nutrient requirements, *Bioindicators, Phosphorus, *Nitrogen, Nutrients, Absorption, Chlamydomonas, Scenedesmus, Anabaena, Chlorophyta, Cyanophyta, Metabolism, Proteins, Carbohydrates, Biochemistry, Enzymes, *Ammonium.

Five freshwater algae (Chlamydomonas reinhardi, Scenedesmus quadricauda, Anabaena variabilis, Pseudoanabaena catenata, and Cryptomonas erosa) were grown in batch culture without nutrient limitation and with various degrees of P and N limitation. They were analysed for several aspects of composition and some metabolic activities of potential use as indicators of nutrient deficiency to aid in establishing values indicative of the presence or absence of nutrient deficiency. Ratios of N/C, P/C, N/P, protein/C, carbohydrate/C, and protein/carbohydrate most clearly differentiated between no, P, and N deficiency. The initial saturated rate of phosphate uptake, P debt, and alkaline phosphatase activity increased distinctly in P deficiency in some of the algae but not in others. Similarly, the initial saturated rate of ammonium uptake and N debt rose in some but not all N-deficient algae. Cryptomonas erosa tended to form walled resting cells (cysts) during growth into P or N deficiency. (Deal-EIS)

PCBS AND DDE IN COMMERCIAL FISH FEEDS,
National Marine Fisheries Service, Ann Arbor, MI. Great Lakes Fishery Lab.
M. J. Mac, L. W. Nicholson, and C. A. McCauley.
The Progressive Fish Culturist, Vol 41, No 4, p 210-211, 1979. 1 Tab, 6 Ref.

Descriptors: *Pesticide residues, *Fish diets, *Fish food organisms, DDE, Polychlorinated biphenyls, Brine shrimp, Aroclors, Chlorinated hydrocarbon pesticides, Gas chromatography, Path of pollutants, Fish hatcheries, *Commercial fish feeds.

Three commercial fish feeds were analyzed for PCBs and p,p'DDE and were reported in dry weight concentrations. In various sizes of Oregon Moist Pellets, concentrations of PCBs ranged from less than 0.10 to 0.30 microg/g and those of p,p'DDE from less than 0.01 to 0.47 microg/g. In Silver Cup, concentrations of PCBs were 0.06 to 0.07 microg/g, and p,p'DDE, 0.01 to 0.06 microg/g. Nauplii of brine shrimp (Artemia salina) contained 0.14 microg/g PCB and 0.03 microg/g p,p'DDE. UPTAKE OF HYDROCARBONS BY THE MARINE DIATOM CYCLOTELLA CRYPTICA,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
M. Karydis.
Microbial Ecology, Vol 5, p 287-293, 1980. 3 Fig, 3 Tab, 22 Ref.

Descriptors: *Diatoms, *Absorption, *Oil, Cytological studies, Marine algae, Metabolism, Chemical analysis, Gas chromatography, Organic compounds, Aromatic compounds, Phytoplankton, *Bioaccumulation, *Paraffins, *Alkanes.

The accumulation of exogenous hydrocarbons by the marine diatom Cyclotella cryptica grown in culture has been studied using gas chromatography. Exposure of the alga to paraffins for 10 days results in accumulation of n-alkanes having between C13 and C16 carbon atoms. The C16 level in the accumulated fraction is twice as high as that in the original oil. (Deal-EIS)

PRELIMINARY RESULTS ON UPTAKE AND ELIMINATION AT DIFFERENT TEMPERATURES OF P,P'-DDT AND TWO CHLOROBIPHENYLS IN PERCH FROM BRACKISH WATER,
National Swedish Environment Protection Board, Stockholm. Research Lab.
M. Edgren, M. Olsson, and L. Renberg.
Ambio, Vol 8, No 6, p 270-272, 1979. 2 Fig, 2 Tab, 23 Ref.

Descriptors: *Cooling waters, *Pesticide kinetics, *Fish physiology, Absorption, *DDT, *Polychlorinated biphenyls, Chlorinated hydrocarbon pesticides, Pesticide residues, Perches, Water temperature, Nuclear powerplants, Path of pollutants, *Bioaccumulation, *Tissue analysis.

Cooling water discharged by nuclear power plants usually causes a local temperature rise of up to 10C in the recipient water body. This study investigated how such a temperature increase influences the accumulation and elimination of p,p'-DDT and two chlorobiphenyls chosen as representative for PCBs in perch (Perca fluviatilis) at various water temperatures. In the accumulation experiment a temperature difference of 10C resulted in doubled concentrations of the studied chlorinated hydrocarbons. In the elimination experiment, concentrations of the chlorinated hydrocarbons decreased after one week of recovery, but no significant difference in their elimination was observed among fish kept at different temperatures. However, the three organochlorines studied showed different elimination rates. The preliminary results indicate that the bioaccumulation of DDT and PCB increases in fish living in a cooling water recipient. (Deal-EIS)

HEAVY METALS (HG, CD, CU, PB, ZN) IN LIVER AND MUSCLE TISSUE OF FRESHWATER PERCH (PERCA FLUVIATILIS) OF THE LAKE OF BIEL AND THE WALENSEE (IN GERMAN),
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
V. H.-R. Hegi, and W. Geiger.
Schweizerische Zeitschrift fur Hydrobiologie, Vol 21, No 1, p 94-107, 1979. 12 Tab, 19 Ref.

Descriptors: *Heavy metals, *Lakes, *Perches, *Mercury, *Lead, *Copper, *Cadmium, *Zinc, Chemical analysis, Fish physiology, Animal metabolism, Water quality standards, *Tissue analysis, *Liver, *Muscle.

Liver and muscle tissue from fish caught between 1973 and 1975 in two Swiss lakes, namely the Lake of Biel and the Walensee, were analyzed for the heavy metals Hg, Cd, Cu, Pb and Zn. The research project was carried out within the framework of an international OECD program. The comparison of metal concentrations in fish originating from the two lakes revealed for the Lake of Biel higher Hg values throughout and higher Cu and Zn values in the livers, whereas for the Walensee the Cd values were formed to be higher in the livers. The Pb concentrations did not differ significantly. With regard to the examined organs (livers and muscles) the comparison showed higher Hg concentrations in the muscles than in the livers. The Cd, Cu, Pb and Zn concentrations, however, were found to be higher in the livers. Not a single fish sample exceeded Switzerland's admissible tolerance level for Hg, namely 0.5 mg/kg in fish meat. (Deal-EIS)

PURIFICATION AND PROPERTIES OF SOLUBLE ARYLSULPHATASES ISOLATED FROM HEPATOPANCREAS OF THE SHRIMP CRANGON CRANGON L.
Akademia Medyczna, Gdansk (Poland). Dept. of Biology.
G. Drewa, T. Dabrowska, Z. Zbytniewski, and F. Pautsch.
Kieler Meeresforschungen, Vol 4, p 360-365, 1978. 2 Fig, 4 Tab, 6 Ref.

Descriptors: *Enzymes, *Inhibition, *Detergents, *Shrimp, Animal metabolism, Animal physiology, Biochemistry, Oil, Fuels, Surfactants, Chromatography, Chemical properties, Mode of action, *Tissue analysis, *Arysulphatases.

Arylsulphatase A and B were isolated from the hepatopancreas of the shrimp Crangon crangon L. after 7 days incubation in 50 ppm of detergent 'SOLO'. Arylsulphatase A,B-1 and B-2 were isolated from the hepatopancreas of the shrimp C. crangon L. incubated in pure brackish water (salinity 7 o/oo). Heavy and light fuel oil added to the enzyme in vitro in concentrations of 2.0% inhibit the activity of arylsulphatase A to a greater degree than arylsulphatase B (14.4% and 5.5% respectively). Detergent 'SOLO' (mixture of nonionic and anionic detergents) in the concentrations of 0.5% arylsulphatase A and for 91% arylsulphatase B, whereas in concentrations of 2.0% it inhibits arylsulphatase A for 91.7% and arylsulphatase B for 100%. ISOLATION AND ELEMENTAL ANALYSIS OF METAL-RICH GRANULES FROM THE KIDNEY OF THE SCALLOP, PECTEN MAXIMUS (L.),
Natural Environment Research Council, Aberdeen (Scotland). Inst. of Marine Biochemistry.
S. G. George, B. J. S. Pirie, and T. L. Coombs.
Journal of Experimental Marine Biology and Ecology, Vol 42, p 143-156, 1980. 5 Fig, 4 Tab, 21 Ref.

Descriptors: *Metals, *Cytological studies, Animal metabolism, Calcium, *Manganese, *Zinc, *Phosphorus, *Magnesium, *Copper, *Iron, *Cadmium, Potassium, *Sulfur, Chlorine, Chemical analysis, Electron microscopy, Biological membranes, Animal physiology, Path of pollutants, *Pecten, *Scallops, *Tissue analysis, *Kidney.

Excretory granules from the kidney of the scallop, Pecten maximus (L.), have been isolated and purified. Their morphology has been determined by electron microscopy and their elemental composition by electron-probe X-ray micro-analysis. The granules, varying in size from 5-15 um diameter, are inorganic in nature and contain Ca, Mn, Zn, and P, equivalent to 75% of their dry weight, with Mg, Cu, Fe, Cd, K, S, and Cl also present in much smaller amounts. The granules show large variations in elemental composition but the sum of the metals is always close to equimolarity with the phosphorus content. Electron microscopy of the kidney tissue showed that there is a gradual development of the granules from lysosomal membranous vesicles to highly mineralized membrane-limited vacuoles or residual bodies, which are eventually excreted as such into the urinary tract. EFFECT OF LONG-TERM LEAD EXPOSURE ON THE SEAWATER AND SEDIMENT BACTERIA FROM HETEROGENEOUS CONTINUOUS FLOW CULTURES,
Institut fuer Meeresforschung, Bremerhaven (Germany, F.R.). Dept. of Bacteriology.
T. L. Tan.
Microbial Ecology, Vol 5, p 295-311, 1980. 6 Fig, 6 Tab, 46 Ref.

Descriptors: *Lead, *Bacteria, *Toxicity, *Growth rates, Heavy metals, Resistance, Marine bacteria, Seawater, Absorption, Sediments, Aerobic bacteria, Anaerobic bacteria, Azotobacter, Nitrogen fixing bacteria, Adaptation.

Lead-influenced changes of the composition of seawater and sediment bacteria were studied in two flow cultures run with lead-contaminated artificial seawater (1 mg Pb2+/l) and one control culture. During the experiment viable counts of physiological groups of bacteria from the control culture were not significantly different from that of the lead-contaminated cultures. Lead tolerance of seawater and sediment bacteria strains was investigated. Comparisons of growth yields showed that lead tolerance of seawater and sediment bacteria was lost again if the bacteria were cultivated in a medium without lead. Lead tolerance could not be demonstrated for the sediment bacteria of one lead-contaminated culture. Heterotrophic uptake measurements with radioactive glucose indicated that seawater bacteria from the lead-contaminated cultures adapted to lead pollution. The sediment bacteria, however, did not reveal lead tolerance by this method. Fluctuations in lead content of the sediment as well as of the overlying seawater gave indications of adsorption-desorption processes between seawater and sediment. Lead was not homogeneously distributed at the sediment surface. (Deal-EIS)
W80-03283

CONCENTRATIONS OF ARSENIC, SELENIUM AND TEN HEAVY METALS IN SCHOOL SHARK, GALEORHINUS AUSTRALIS (MACLEAY), AND GUMMY SHARK, MUSTELUS ANTARCTICUS GUNTHER, FROM SOUTH-EASTERN AUSTRALIAN WATERS,
Victoria Dept. of Agriculture, Melbourne (Australia).
J. W. Glover.
Australian Journal of Marine and Freshwater Research, Vol 30, p 505-510, 1979. 1 Tab, 13 Ref.

Descriptors: *Sharks, *Heavy metals, *Baseline studies, *Cadmium, *Copper, *Manganese, *Zinc, *Cobalt, *Chromium, *Lead, *Nickel, *Molybdenum, Path of pollutants, Chemical analysis, Spectrophotometry, *Arsenic, *Selenium, *Tissue analysis, *Bioaccumulation.

The maximum concentrations of arsenic, cadmium, copper, manganese, selenium and zinc in the edible flesh of G. australis and M. antarcticus were found to be 30, 0.08, 0.6, 0.8 and 4.8 micro/g, wet weight respectively. The concentrations of cobalt, chromium, lead, molybdenum and nickel were below the limits of detection, namely 0.3, 0.5, 0.1, 0.2 and 0.2 microg/g, wet weight respectively, of the methods used. Samples for analysis were taken from one male and one female shark of each species caught in six areas in south-eastern Australian waters. Wherever possible the concentrations of the elements were correlated with the sharks' species, sex and site of capture. (Deal-EIS)

COMBINED EFFECTS OF CADMIUM, COPPER AND LEAD ON DEVELOPING HERRING EGGS AND LARVAE,
Biologische Anstalt Helgoland, Hamburg (Germany, F.R.).
H. V. Westernhagen, V. Dethlefsen, and H. Rosenthal.
Helgolander wissenschaftliche Meeresuntersuchungen, Vol 32, p 257-278, 1979. 11 Fig, 5 Tab, 23 Ref.

Descriptors: *Fish eggs, *Toxicity, *Heavy metals, *Cadmium, *Copper, *Lead, Larval growth stage, Embryonic growth stage, Herrings, Mortality, Absorption, Path of pollutants, *Bioaccumulation, *Tissue analysis.

Eggs of Baltic herring were incubated (10C; 16 o/oo S) in sea water containing mixtures of Cd, Cu and Pb at concentrations of 0.56 - 5.0, 0.0167 - 0.15, 0.56 - 5.0 mg metal/l. Embryonic survival until hatching, viable hatch and uptake of metals by embryos and early larvae were measured. Negative effects of metals on embryonic survival and viable hatch were additive in the case of Cu and Cd. Pb did not exert detrimental effects. Uptake of metals with exposure time was non-linear in eggs and linear in larvae. Total uptake of Cu and Cd by eggs was subjected to antagonistic or synergistic action of the other two metals present. Accumulation of Pb by eggs was enhanced when Cu was also present. (Deal-EIS)
W80-03286

MERCURY, DDE, AND PCBS IN EGGS FROM A NORWEGIAN GANNET COLONY,
Tromsoe Univ. (Norway).
N. Fimreite, N. Kveseth, and E. M. Brevik.
Bulletin of Environmental Contamination & Toxicology, Vol 24, p 142-144, 1980. 1 Tab, 14 Ref.

Descriptors: *Mercury, *Pesticide residues, *Bird eggs, DDE, Polychlorinated biphenyls, Heavy metals, Water birds, Pesticide kinetics, Path of pollutants, Gas chromatography, *Gannet, *Morus, *Tissue analysis.

The residues of mercury, DDE and PCBs in seabird eggs sampled in 1972 were compared to similar analyses in 1978. The average total mercury level increased from 0.58 to 0.80 ppm between 1972 and 1978. In contrast to mercury, the DDE and PCB levels decreased substantially in the same period, from 2.1 to 0.66 and from 7.7 to 3.5 ppm, respectively. The mercury was composed almost entirely of methylmercury. (Deal-EIS)
W80-03288

TOXIC EFFECTS OF THE PHYTOALKALOID COLCHICINE ON OVIPOSITION AND NEUROSECRETION OF THE VECTOR SNAIL (INDOPLANORBIS EXUSTUS),
Marathwada Univ., Aurangabad, (India). Dept. of Zoology.
M. M. Hanumante, D. P. Vaidya, and R. Nagabhushanam.
Bulletin of Environmental Contamination & Toxicology, Vol 24, p 37-39, 1980. 1 Tab, 7 Ref.

Descriptors: *Pesticide toxicity, *Gastropods, *Molluscicides, Animal parasites, Vectors(Biological), Trematodes, Worms, Mode of action, Reproduction, Inhibition, Fertility, Public health, *Colchicine.

Chemical control of freshwater gastropods that transmit trematode parasites is still the most promising method of curbing snail-borne diseases. This

study examines the effectiveness of colchicine in disrupting reproduction in the snail (Indoplanorbis exustus). At sublethal concentrations (10 ppm) colchicine had critical effects at both behavioral (oviposition) and cellular (neurosecretory) levels. Effects were also noted in the structure and number of eggs laid, significantly decreasing fertility. The specific cellular types and functions effected are also discussed. (Deal-EIS)

IDENTIFICATION OF CHLORDANES AND RELATED COMPOUNDS IN GOBY-FISH FROM TOKYO BAY,
Tokyo Metropolitan Research Lab. of Public Health (Japan).
T. Miyazaki, K. Akiyama, S. Horii, and T. Yamagishi.
Bulletin of Environmental Contamination & Toxicology, Vol 24, p 1-8, 1980, 5 Fig, 2 Tab, 14 Ref.

Descriptors: *Pollutant identification, *Pesticide residues, *Marine fish, Pesticide kinetics, *Chlorinated hydrocarbon pesticide, Heptachlor, Gas chromatography, Path of pollutants, Chemical properties, Bioindicators, *Nonachlor, *Chlordane, *Japan, *Goby-fish, *Tissue analysis.

We recently reported that trans-nonachlor had been identified in gaby-fish collected from Tokyo Bay. The detection of this compound in fauna suggested environmental pollution by chlordane and/or heptachlor, because trans-nonachlor is one of the constituents of technical chlordane and technical heptachlor. The goby-fish samples known have been intensively examined. Four unknown peaks were found in the fractions of organochlorine pesticides. The unknowns were identified as oxychlordane, trans and cis-chlordanes and cis-nonachlor by gas chromatography-mass spectrometry. These compounds have not been previously identified in environmental biota in Japan, while detected only in U.S.A. (Deal-EIS)
W80-03290

EFFECTS OF P,P'-DDT, P,P'-DDD, AND P,P'-DDE ON OXYGEN UPTAKE IN THE FRESHWATER PLANARIAN (PHAGOGATA GRACILIS),
Middle Tennessee State Univ., Murfreesboro.
B. H. Batey, and M. R. Wells.
Bulletin of Environmental Contamination & Toxicology, Vol 24, p 128-133, 1980. 4 Tab, 5 Ref.

Descriptors: *Pesticide toxicity, *Oxygen requirements, *Worms, *DDT, DDD, DDE, *Chlorinated hydrocarbon pesticides, Toxicity, Mode of action, Oxygen demand, Animal metabolism, Enzymes, Biodegradation, *Planarians, *Phagocata, *Bioaccumulation.

The toxicity of DDT and two of its metabolites (DDD and DDE), as measured by oxygen uptake, was studied in the freshwater planarian, Phagocata gracilis. The data presented indicate that 60-min exposure of P. gracilis to beef liver perfused with 10 ppm of p,p'-DDT, p,p'-DDD, or p,p'-DDE in corn oil was not toxic to this species. It is possible, therefore, that P. gracilis possessses a microsomal enzyme system capable of degrading DDT into DDD and DDE by reductive dechlorination and dehydrochlorination, respectively. It is also conceivable that P. gracilis failed to accumulate within 60 min sufficient amounts of DDT, DDD, or DDE to toxic effects. Longer exposure of P. gracilis to DDT and its metabolites could perhaps result in the buildup of dangerously toxic levels in its adipose tissue. (Deal-EIS)
W80-03291

A POSSIBLE PHYSIOLOGICAL UPTAKE MECHANISM OF METHYLMERCURY BY THE MARINE BLOODWORM (GLYCERA DIBRANCHIATA),
Illinois State Univ., Normal. Dept. of Biological Sciences.
D. M. Medeiros, L. L. Cadwell, and R. L. Preston.
Bulletin of Environmental Contamination & Toxicology, Vol 24, p 97-101, 1980. 2 Fig, 1 Tab, 13 Ref.

Descriptors: *Mercury, *Worms, *Absorption, Chemical properties, Chemical reactions, Path of pollutants, Heavy metals, Radiochemical analysis, Tracers, Membrane processes, Animal metabolism, *Depuration, *Tissue analysis, *Methylmercury.

The objective of this paper is to examine the uptake mechanism of methyl-mercury from water in a lower-food-chain organism, the marine bloodworm (Glycera dibranchiata). Whole bloodworms were exposed to 10 ppb 203Hg for 4 days and monitored at regular intervals by a scintillation detector. Elimination of 203Hg after a half-hour exposure was also studied. Initial uptake of mercury was extremely rapid (60 ppb within the first 10 h as compared to 80 ppb for 80 h.). Elimination was also extremely rapid in the initial phase. In a sea water medium the final (8h.) concentration was still 70% of original mercury content. In a cysteine medium the final mercury content was less than 20% of the original. Various mechanisms for membrane uptake of mercury are discussed. (Deal-EIS)

SELENIUM TOXICITY TO DAPHNIA MAGNA, HYALLELA AZTECA, AND THE FATHEAD MINNOW IN HARD WATER,
Michigan State Univ., East Lansing. Pesticide Research Center.
M. T. Halter, W. J. Adams, and H. E. Johnson.
Bulletin of Environmental Contamination & Toxicology, Vol 24, p 102-107, 1980. 1 Fig, 2 Tab, 23 Ref.

Descriptors: *Toxicity, *Metals, *Daphnia, *Minnows, Bioassay, Hardness(Water), Mortality, Lethal limit, Amphipoda, Animal physiology, Fish physiology, Fertility, *Selenium, *Hyallela fathead minnow.

This is a report on the comparative toxicity of selenium to three common representatives of the warm-water biota, Daphnia magna, Hyallela azteca, and the fathead minnow (Pimephales promelas). Selenium concentrations above about 0.5 mg/l were lethal to daphnia within 96h, but at lower concentrations toxicity declined sharply. H. azteca were killed by selenium levels above about 0.5 mg/l for 96h. Continued exposure at lower selenium concentrations produced additional mortalities. Mortalities of fathead minnow fry occurred at all selenium levels tested, from 0.35 to 1.4 mg/l Se. Daphnia was the most sensitive species initially but the least sensitive ultimately. Amphipods were the most sensitive species after 336h (two weeks) of exposure, but further effects apparently could be expected under continued exposure for both amphipods and fish. The threshold reaction time or induction period of selenium toxicity, as seen at higher selenium levels, for fish was at least double that measured for invertebrates. (Deal-EIS)

HEAVY METALS IN THE SEDIMENTS OF THE GULF OF BOTHNIA,
Stockholm Univ. (Sweden). Dept. of Geology.
R. O. Hallberg.
Ambio, Vol 8, No 6, p 265-269, 1979. 4 Fig, 6 Tab, 30 Ref.

Descriptors: *Heavy metals, *Sediments, *Path of pollutants, Industrial wastes, *Nickel, *Manganese, *Cobalt, *Molybdenum, *Cadmium, *Zinc, *Iron, *Copper, *Lead, *Mercury, Water chemistry, Water pollution sources, Bottom sediments, *Arsenic, *Vanadium.

The Baltic Sea has been severely contaminated with metals since the beginning of this century. This study reports on an examination of heavy metal sediment and tributary river chemistry in the northern part of the Baltic Sea--the Gulf of Bothnia. The Gulf was found to be highly polluted with heavy metals, especially arsenic, lead and mercury. Rivers constituted the primary pathways of metals to the Gulf. Because the metal content of the sediments does not correlate to the river loadings, this probably indicates that large amounts of metals are transported south to the Baltic proper. (Deal-EIS)

HYDROIDS IN BIOTEST: CLAVA MULTICORNIS EXPOSED TO CADMIUM,
Kiel Univ. (Germany, F.R.). Inst fuer Meereskunde.
H. Fischer.
Kieler Meeresforschungen, Vol 4, p 327-334, 1978. 2 Fig, 1 Tab, 27 Ref.

Descriptors: *Cadmium, *Toxicity, *Water temperature, Bioassay, Salinity, Predation, Animal behavior, Heavy metals, Mortality, Bioindicators, *Hydroids, *Clava, *Hydrozoa.

The influence of different temperatures and salinities on the toxicity of cadmium has been studied in short- and long-term experiments, using the colonial hydroid Clava multicornis as test organism. Clones were subcultured under prospective T/S-test conditions, applying 12 1 recirculating seawater systems with biological water conditioning, glass plates for substratum, and Artemia nauplii for food. The inability of C. multicornis to catch and swallow prey induced by heavy metals was chosen as lethal criterion. High temperature and low salinity within the ecological range of the species increased the acute toxicity of cadium, while low temperature and high salinity enabled C. multicornis to resist higher metal concentrations in the water or delayed the appearance of reactions on pollution, respectively. The long-term sublethal threshold concentration of some 200 microg Cd/l was not affected by combinations of temperature from 5 to 20C and salinity from 10 to 25 o/oo. (Deal-EIS)
W80-03296

TOXIC EFFECTS AND ACCUMULATION OF CADMIUM IN SOME BENTHIC ORGANISMS OF THE BALTIC,
Kiel Univ. (Germany, F.R.). Inst. fuer Meereskunde.
N. Scholz, H. Fischer, and H. Theede.
Kieler Meeresforschungen, Vol 4, p 317-326, 1978. 4 Fig, 24 Ref.

Descriptors: *Cadmium, *Toxicity, *Benthic fauna, Water temperature, Salinity, Mollusks, Mussels, Heavy metals, Animal physiology, Animal metabolism, Path of pollutants, Mode of action, Enzymes, Inhibition, Biochemistry, Proteins, *Hydrozoa, *Clavis, *Laomedea, *Tissue analysis, *Bioaccumulation, *Baltic Sea.

In coastal areas or estuaries cadmium content of water and sediments may be distinctly increased. The acute toxicity of Cd to sensitive organisms is strongly modified by environmental factor combinations occuring in the Baltic. In comparison with other species and developmental stages, up to the present, Laomedea loveni proved to be the most sensitive test species to Cd. Within the ecological range the sensitivity to Cd increases with higher temperatures and lower salinities. Under these conditions not only is the rate of accumulation of Cd enhanced, but the protoplasmic sensitivity is increased to internal metal concentration. In long-term experiments with Clava multicornis the modifying effect of temperature and salinity decreases during the course of some weeks. Contrary to cnidarians, many molluscs are able to accumulate high concentrations of Cd without signs of physiological damage. In many places in the Western Baltic the levels of Cd in Mytilus edulis are higher than in comparable individuals from localities on the North Sea coast. There are also correlations of Cd content of mussels with depth of their locality, size, and season. Of the mussel's organs, digestive diverticula and kidney greatly accumulate the metal. Preliminary results with ion exchange, and gel filtration chromatography of the mussel's proteins, suggest the occurence of special Cd-binding proteins, e.g. in the hepatopancreas, as a main reason for the high tolerance of M. edulis to cadmium. (Deal-EIS)

Akademia Medyczna, Gdansk (Poland). Dept. of

Biology.
F. Pautsch.
Kieler Meeresforschungen, Vol 4, p 335-359, 1978. 22 Fig, 2 Tab, 26 Ref.

Descriptors: *Toxicity, *Detergents, *Oil, *Phosphorus compounds, Fuels, Oil pollution, Surfactants, Fertilizers, Chemical wastes, Shrimp, Crabs, Carp, Pikes, Perches, Animal metabolism, Enzymes, Reproduction, Growth stages, Animal growth, Mode of action, *Crude oil, *Dispersants, *Phosphogypsum.

The subject of the experimental investigations is the effects of chronic toxicity exerted by the following pollutants of industrial origin on some animals from the Bay of Gdansk: (1) phosphogypsum; (2) some detergents, i.e. a commercial product 'So-LO', a mixture of nonionic and anionic surfactants (for household purposes), and an oil-spill remover Gamlen 'CW' Solvent; (3) crude Kuwait oil and one of its derivatives, fuel oil No. III. The experimental animals are: Crangon crangon L., Rhithropanopeus harrisi (Gould), the crucial carp (Carassius carassius L.), the pike (Esox lucius L.) and the perch (Perca fluviatilis L). The pollutants mentioned above induce sublethal changes in: the enzymic system; reproductive activity; and embryonic and larval development. Additionally, degenerative changes in the ultrastructure of crustacean brain and pathological disturbances in function and structure of isolated mitochondria could be observed. The general conclusion is that chronic sublethal toxicity may severely affect or even destroy some marine ecosystems. (Deal-EIS)

THEORETICAL AND EXPERIMENTAL STUDY OF WIND- AND WAVE-INDUCED DRIFT,
Shell Development Co., Houston, TX.
D. T. Tsahalis.
Journal of Physical Oceanography, Vol 9, No 6, p 1243-1257, November 1979. 13 Fig, 5 Tab, 28 Ref.

Descriptors: *Aquatic drift, *Oil spills, *Laboratory tests, *Theoretical analysis, Model studies, Mathematical models, Winds, Velocity, Shear, Waves(Water), Pollutants, Water pollution, Path of pollutants, Oceans, Oceanography, Surface drift.

A study was carried out on the surface drift on open water due to the combined action of currents, winds, and wind-generated waves for cocurrent and countercurrent airflow. It was shown theoretically that the nondimensional groups necessary for the modeling of the surface drift are (T - c)/c and U sub 10/c, where U sub 10, T, and c are the wind, water surface, and current velocities, respectively, the wind being measured at the uniquely adopted height of 10 m. Surface drift experiments, carried out in a current tank/wind tunnel, verified the dependence on the above groups and led to the derivation of relationships for the calculation of the total surface drift. The surface drifts, calculated from the above relationships, were in excellent agreement with available field and laboratory data. These results supported Charnock's expression relating the surface roughness and shear velocity for completely rough flow due to gravity waves and Wu's Froude number scaling of wind-stress coefficients. Furthermore, these results showed that wind-generated waves generally cause a net decrease or increase of the surface drift for cocurrent and countercurrent airflow, respectively. Finally, laws were formulated for the scaling of current tank/wind tunnel data for wind velocities and significant wave heights to prototype (atmospheric boundary layer) conditions. (Sims-ISWS)

THE IMPACTS OF COAL STRIP MINING ON THE HYDROGEOLOGIC SYSTEM OF THE NORTHERN GREAT PLAINS: CASE STUDY OF POTENTIAL IMPACTS ON THE NORTHERN CHEYENNE RESERVATION,
Nevada Univ. System, Las Vegas. Water Resources Center.
W. W. Woessner, C. B. Andrews, and T. J. Osborne.
Journal of Hydrology, Vol 43, No 1/4, p 445-467, October 1979. 7 Fig, 3 Tab, 44 Ref, EPA R803566.

Descriptors: *Strip mines, *Groundwater, *Effects, *Great Plains, *Montana, Mining, Coal mines, Water quality, Dissolved solids, Aquifers, Geology, Hydrogeology, On-site investigations, Model studies, Mathematical models, Water pollution sources, Hydrology, Strip mining impacts.

Fifty percent of the coal production of the U.S. will be obtained from the western coal fields by 1990. The majority of this coal will be produced from large-scale strip mining of the Tertiary Fort Union and Wasatch Formations of Wyoming, Montana, and North Dakota. The rapid escalation of coal strip-mining activities in the Northern Great Plains, where groundwater is the principal source of domestic and agricultural supply, threatens to alter significantly the local and regional hydrologic regime. A study of the potential impacts of strip mining on their water resources was designed and implemented. After a basic hydrogeologic study was conducted, a hypothetical mine study site was selected for evaluation. The premining hydrologic system was defined from a monitoring well network, aquifer testing, water-quality sampling, and stream gaging. Saturation extract and leachate analyses were conducted on cuttings of overburden from wells in the mine area, and results were used to predict the concentration of total dissolved solids (TDS) in spoil-water discharge. Strip mining of the entire minable area would have a major impact on the regional groundwater quality and a measurable impact on the quality of the receiving stream. Analysis of projected hydrologic properties of the post-mining system indicated that water-quality impacts will last for hundreds of years. (Sims-ISWS)

THE VOLUME-AVERAGED MASS-TRANSPORT EQUATION FOR CHEMICAL DIAGENETIC MODELS,
Illinois Univ. at Urbana-Champaign. Dept. of Geology.
P. A. Domenico, and V. V. Palciauskas.
Journal of Hydrology, Vol 43, No 1/4, p 427-438, October 1979. 1 Fig, 18 Ref.

Descriptors: *Mass transfer, *Diagenesis, *Chemicals, *Equations, *Model studies, Mathematical models, Groundwater, Groundwater movement, Pores, Pollutants, Path of pollutants, Adsorption, Solutes, Porous media, Soil water.

The mass-transfer equation as appropriate for chemical diagenesis problems was developed from the viewpoint of a divergence theorem. Specific features of the averaged equations included some well-known results, such as the structure of a diffusion coefficient in a porous sediment and the emergence of dispersion as a dominant mixing phenomenon. Other results reflected the inclusion for provisions for an upper moving boundary for accumulating sediments and a suggested structure for heterogeneous reactions at phase interfaces. Specific forms for the fluxes at interfaces were determined on the basis of conceptual models of the reaction process. (Sims-ISWS)

TIME-DEPENDENT SORPTION ON GEOLOGICAL MATERIALS,
Nevada Univ. System, Reno. Water Resources Center.
P. R. Fenske.
Journal of Hydrology, Vol 43, No 1-4, p 415-425, October 1979. 3 Fig, 3 Tab, 4 Ref.

Descriptors: *Sorption, *Radioisotopes, *Rocks, *Laboratory tests, Cesium, Groundwater, Aquifers, Groundwater movement, Equilibrium, Velocity, Water quality, Pollutants, Path of pollutants, Gravels, Water pollution, Time-dependent sorption, Geological materials.

The transport of radionuclides through geologic materials has been predicted using the assumption that sorption on rocks along the transport path occurs instantaneously. This assumption is valid if equilibrium sorption is reached rapidly relative to groundwater velocity. Laboratory experiments with large pieces of rock and also varying particle sizes indicate that equilibrium sorption may be reached too slowly under some conditions for the assumption of instantaneous sorption to be valid. An empirical equation has been devised from the laboratory experiments to describe the time-dependent sorption process for 137Cs on breccia and andesite. The hypothetical example was then worked out for flow through granular materials (pebble and cobble size) and flow through fractured rocks considering a time-dependent sorption. Dispersion was not considered in this analysis. The hypothetical prediction showed that for usual groundwater velocities, transport considering time-dependent sorption is not significantly greater than transport assuming equilibrium sorption. At velocities of groundwater above 0.5 cm/hr (1 ft/hr) the effect of the time-dependent sorption term can easily be seen in the analysis. The analysis also showed that sorption during transport through granular (pebble and cobble size) materials is less, with less retardation, than sorption during transport through fractured rocks. This is because the mass of rock/volume of water ratio is far greater in fractured materials than in granular materials. Consideration of time-dependent sorption will probably not increase predictive capability for radionuclide transport. (Sims-ISWS)

DEMONSTRATION OF NONPOINT POLLUTION ABATEMENT THROUGH IMPROVED STREET CLEANING PRACTICES,
Woodward-Clyde Consultants, San Francisco, CA.
R. Pitt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-108988, Price codes: A13 in paper copy, A01 in microfiche. Report No EPA-600/2-79-161, August 1979, 289 p, 96 Fig, 114 Tab, 57 Ref, 7 Append. S-804432.

Descriptors: *Urban runoff, *Dusts, *Pollution abatement, *Water pollution control, Water quality, Particle size, Cost-benefit analysis, Air pollution, Paving, Cost analysis, Waste water treatment, Storm drains, California, Street cleaning.

The role of street dirt in water and air pollution, and methods of reducing this source of pollution, are described. Sampling procedures to test street cleaning equipment performance were developed and used to determine the range of capabilities of current street cleaning equipment and to gain general information about the cost and effectiveness of various street cleaning programs. Accumulation rates for street surface particulates were measured between each street cleaner test in San JOse, California. Overall, as particle size of pollutants decrease, concentrations increase. Also, most street cleaning equipment is more effective at removing large particles than small. Equipment tests showed that test area differences are more important to performance than differences in equipment. Types of equipment tested were: four-wheel mechanical street cleaners, state-of-the-art mechanical four-wheel street cleaners, and vacuum-assisted street cleaners. Smooth asphalt streets are easier to maintain in clean state than rough streets. Pollutant mass flow characteristics of urban runoff were also studied to estimate the beneficial effects of street cleaning and to compare the quality of urban runoff with sanitary waste water effluent quality. Cost and labor analyses were included for street cleaning, runoff treatment, and combined runoff and waste water treatment. Results of a study on air pollution from street dirt are also presented. (Seigler-IPA)

ASSESSING IMPACTS OF LAND MANAGEMENT ACTIVITIES ON EROSION-RELATED NONPOINT SOURCE PROBLEMS,
Oregon State Dept. of Environmental Quality, Portland.
D. A. Rickert, and G. L. Beach.
Journal of Water Pollution Control Federation, Vol 50, No 11, p 2439-2445, 1978. 3 Fig, 2 Tab, 8 Ref.

Descriptors: *Oregon, *Stream erosion, *Nonpoint pollution, *Land management, Erosion, Water quality, Maps, Land use, Sedimentation, Watersheds(Basins), Surveys, Environmental effects, Management, Soil erosion, Land resources, Land, Environment, Forestry, Grazing, Agriculture.

This paper deals with Phase II of Oregon's Section 208 water quality planning process, a detailed basin assessment project aimed at relating stream quality to both natural terrain characteristics and to land management activities within forestry, grazing, and agriculture. Its goal is to determine relative erosion potential and most suitable management activities for different terrains. The assessment emphasizes erosion and sedimentation because these are the most widespread and pervasive non-point pollution problems in Oregon. Instead of collecting water quality data, the project determines stream quality through reconnaissance field surveys of channel stability and fishery habitat conditions. In contrast to water quality parameters, these stream characteristics are more permanent. Maps and matrices show areas where erosional and depositional problems are most prevalent. In addition, plant nutrients, pesticides, and trace metals tend to move into streams due to attachment to sediment particles. By using erosion potential maps and impact matrices, data programs can be spatially designed to better define cause-and-effect relationships of land and water quality. As developed, the procedure can be used to determine suitability of land management activities, monitor the success of land management regulations, and set priorities for site-specific studies of land management activities. DEPOSITION VELOCITY OF PHOSPHORUS-CONTAINING PARTICLES OVER SOUTHERN LAKE HURON, APRIL-OCTOBER, 1975,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
R. Delumyea, and R. L. Petel.
Atmospheric Environment, Vol 13, No 2, p 287-294, 1979. 8 Fig, 3 Tab, 18 Ref.

Descriptors: *Lake Huron, *Phosphorus, *Deposition(Sediments), *Velocity, *Mathematical models, Aerosols, Fallout, Particle size, Dusts, Model studies, Limiting factors, Mixing, Winds, Erosion, Wind erosion, Aeolian soils, Wind velocity, Atmosphere, Air circulation.

Based on samples from Lake Huron and 11 land stations collected April-October 1975, a 0.57 cm/sec deposition velocity for phosphorus-containing particles was calculated using a mixing box model. Phosphorus is the limiting nutrient in the Great Lakes region. Dry deposition represents an important input mechanism since all material entering the lake by this method must pass through the euphotic zone and dry deposition is a continuous process. Particle mass median diameter is 1 micro m with 10% less than 0.1 micro m in size; the most significant fraction is due to continental erosion. The ratio of downwind to upwind phosphorus contents of aerosol, C/Co, ranges 0.4-0.8; this ratio increases with increasing wind speed. The C/Co is independent of concentration which ranges 13.4-33.2 micro g/cu m. The faster the wind blows, the smaller the aerosol residence times over the lake. The C/Co values were used to calculate deposition velocities for each period using a simple box model. Assumptions include: (1) constant mixing height; (2) complete sink at the bottom; (3) complete content mixing; (4) no aerosol sources in the box; (5) constant deposition velocity; and (6) wind direction knowledge. Calculated deposition velocity, 0.57 cm/sec is higher than wind tunnel data but is consistent with other field experiments. (Danovich-Wisconsin)

BENTHIC INVERTEBRATES, PERIPHYTON, AND BOTTOM MATERIAL AND THEIR TRACE-METAL CONCENTRATIONS IN SALMON CREEK BASIN, CLARK COUNTY, WASHINGTON,
Geological Survey, Portland, OR. Water Resources Div.
A. C. White, and S. W. McKenzie.
Geological Survey open-file report 79-978, 1979. 18 p, 1 Fig, 8 Tab, 20 Ref, Append.

Descriptors: *Trace elements, *Environmental effects, *Aquatic animals, *Water analysis, *Benthos, Bottom sediments, Benthic fauna, Invertebrates, Chemical analysis, Heavy metals, Physical properties, Periphyton, Evaluation, *Salmon Creek basin(WA).

In 1978, data were collected for identification and quantification of benthic invertebrates, periphyton, and bottom material and their trace-metals concentrations from three sites in Salmon Creek basin, Wash. Metal analyses included arsenic, cadmium, chromium, copper, lead, zinc, selenium, and mercury. Physical data collected included water temperature, dissolved oxygen, pH, discharge, and size of cobbles and fine stream-bottom material. Additional chemical analyses included major constituents. Benthic invertebrate identifications were generally taken to the generic level, with a total of 49 taxons identified and quantified. A total of 36 periphyton taxons were quantified and identified, generally at the species level. (Woodard-USGS)

WATER-QUALITY CONDITIONS IN THE NEW RIVER, IMPERIAL COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
J. G. Setmire.
Geological Survey Water-Resources Investigations 79-86, July 1979. 63 p, 17 Fig, 12 Tab, 15 Ref.

Descriptors: *Water pollution sources, *Organic wastes, *Water quality, *Mexico, *California, Streams, Water analysis, Dissolved oxygen, Chemical oxygen demand, Turbidity, Carbon, Evaluation, *International streamflow, *Mexico-California boundary, *New River(Calif), *Imperial County(Calif).

The New River, when entering the United States at Calexico, Calif., often contains materials which have the appearance of industrial and domestic wastes. Passage of some of these materials is recognized by a sudden increase in turbidity over background levels and the presence of white particulate matter. Water samples taken during these events are usually extremely high in organic content. During a 4-day reconnaissance of water quality in May 1977, white-to-brown extremely turbid water crossed the border on three occasions. On one of these occasions, the water was intensively sampled. The total organic-carbon concentration ranged from 80 to 161 milligrams per liter (mg/l); dissolved organic carbon ranged from 34 to 42 mg/l, and the chemical oxygen demand was as high as 510 mg/l. River profiles showed a dissolved-oxygen sag, with the length of the zone of depressed dissolved-oxygen concentrations varying seasonally. During the summer months, dissolved-oxygen concentrations in the river were lower and the zone of depressed dissolved-oxygen concentrations was longer. The largest increases in dissolved-oxygen concentration from reaeration occurred at the three drop structures and the rock weir near Seeley. The effects of oxygen demanding materials crossing the border extended as far as Highway 80, 19.5 miles downstream from the international boundary at Calexico. Fish kills and anaerobic conditions were also detected as far as Highway 80. Standard bacteria indicator tests for fecal contamination showed a very high health-hazard potential near the border. (Woodard-USGS)

IMPORTANCE OF A BORDERING WETLAND FOR CHEMICAL PROPERTIES OF LAKE WATER,
Warsaw Univ. (Poland). Dept. of Hydrobiology.
A. Kowalczewski.
In: Proceedings: Congress in Denmark 1977, Internationale Vereinigung fur Theoretische und Angewandte Limnologie; Vol 20, Part 4, p 2182-2185, 1978. 7 Ref. OWRT A-054-CONN(8).

Descriptors: *Chemical properties, *Swamps, *Durham Pond(CT), *Nutrient transport, *Decomposing organic matter, Water properties, Hydrogen ion concentration, Lakes, Wetlands, Water quality, Carbon dioxide, Groundwater, Dissolved solids, Organic matter, Color, Conductivity, Degradation(Decomposition), Nutrients, Groundwater movement, Waste assimilative capacity.

Studies of Dunham Pond, Connecticut, a typical New England red maple-Sphagnum swamp with shrub understory and limited herb cover, show that wetlands do not act as important sinks for nutrients; however, they do accumulate dissolved colored organic substances. The first sampling station was located in a spring, middle stations in the swamp, and the last station in lake littoral areas. Water status at the last site before entering the lake reflects the sum of swamp ecosystem metabolism influences. Water after passing through the swamp is not significantly changed with respect to pH, conductivity, and carbon dioxide. Spring pH values vary 5.25-7.0; pH decreases through the swamp; closer to the lake, pH increases again. Carbon dioxide changes are similar to pH changes. After an initial drop, carbon dioxide continues to build up in the stream; carbon dioxide concentrations stay relatively high until reaching the lake. Electrical conductivity of groundwater at station 1 is relatively constant. It decreases at upper stations 2-3, then increases again in lower stream areas. High conductivity values indicate nutrient accumulation. Spring water is practically colorless; during movement through the swamp, average OD increases 3000 times. DOC content in groundwater is relatively low during the year and rarely exceeds 5 mg C/l; however, DOC increases downstream. DOC shows seasonal variations; it is high in November-December and low in January-April when swamp decomposition is also low. (Danovich-Wisconsin)

SIMULATING NUTRIENT MOVEMENT AND TRANSFORMATIONS WITH THE ARM MODEL,
Hydrocomp, Inc., Mountain View, CA.
H. H. Davis, Jr., and A. S. Dinigian, Jr.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 5, p 1081-1086, September-October 1979. 9 Fig, 1 Tab, 12 Ref.

Descriptors: *Nutrients, *Water pollution, *Runoff, *Agricultural runoff, *Model studies, Mathematical models, Nitrogen, Nitrates, Nitrites, Phosphorus, Phosphorus compounds, Agricultural chemicals, Fertilizers, Pollutants, Path of pollutants, Solutes, Sediments, Rainfall, Storms, Simulation analysis.

The plant nutrient section of the Agricultural Runoff Management (ARM) Model was developed for the EPA as a tool for predicting the amounts of plant nutrients (N and P) removed from agricultural lands by precipitation-induced runoff and erosion. First-order kinetics were used to model the transformations, plant uptake, and sorption of soil nitrogen and phosphorus. The influence of soil temperatures on the first-order rates was calculated with a modified Arrhenius equation. Initial testing was performed with data from two small (less than 1.5 ha) watersheds in Michigan and Georgia. Initial results showed that the model was able to repre-

sent soil nutrient data reasonably well. Monthly simulation results of N and P in the runoff were satisfactory; however, storm event simulation of soluble nutrients indicated further study of solution-based transport is needed. (Sims-ISWS)

SIMULATION OF NITROGEN AND PHOSPHORUS LEACHING FROM POULTRY MANURE,
Cornell Univ., Ithaca, NY. Dept. of Agricultural Engineering.
R. E. Muck, and D. C. Ludington.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 5, p 1087-1092, September-October 1979. 6 Fig, 3 Tab, 26 Ref.

Descriptors: *Model studies, *Leaching, *Water pollution sources, *Farm wastes, Laboratory tests, Testing procedures, Mathematical models, Simulation analysis, Porous media, Nutrients, Nitrogen, Phosphorus, Theoretical analysis, Instrumentation.

A model based on simple diffusion was developed to describe the leaching of soluble nitrogen and phosphorus from dry poultry manure aggregates. The leaching losses of ammonia and organic nitrogen measured in laboratory experiments were successfully predicted with the model. Soluble orthophosphate losses were predicted with less success. These predictions could possibly be improved by considering phosphorus solubility. The model was not as successful, however, in predicting soluble nutrient losses from aggregates undergoing breakdown from rainfall impact. Consequently, for the model to be useful on the field level, this model must be combined with models predicting changes in manure aggregate size and other field phenomena. (Humphreys-ISWS)

TILLAGE SYSTEM EFFECTS ON SEDIMENT AND NUTRIENTS IN RUNOFF FROM SMALL WATERSHEDS,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
H. P. Johnson, J. L. Baker, W. D. Shrader, and J. M. Laflen.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 5, p 1110-114, September-October 1979. 2 Fig, 3 Tab, 11 Ref.

Descriptors: *Runoff, *Sediments, *Nutrients, *Agricultural watersheds, Farm management, On-site investigations, Sampling, Pollutants, Water pollution, Phosphorus, Nitrogen, Erosion, Corn(Field), Water pollution sources, Path of pollutants, Hydrology, Tillage practices, Crop residues.

Two conservation tillage systems were studied and compared with the conventional (plow-disk-plant) tillage system. Runoff, soil loss, and nutrient losses during the 1973-75 growing seasons were measured for six small, paired watersheds planted to continuous corn (runoff and soil loss for the year 1972, when conservation tillage systems were being established, were also measured). Fifty-nine percent of the soil surface under ridge-planting and 11% under till-planting were covered with crop residue, compared to less than 2% for conventional planting. Conservation tillage systems on the average reduced runoff about 40% and reduced soil loss from 60 to 90%. Total losses of nitrogen and phosphorus (total P in sediment measured only in 1973) were mostly associated with soil loss and consequently were decreased for conservation tillage systems. Solution phosphorus losses and concentrations and available P concentrations in sediment (measured in 1974 and 1975) increased with residue cover. Several factors could be responsible, including decreased fertilizer incorporation, selective erosion processes, and the residue being a phosphorus source. Corn yield data were given. (Sims-ISWS)

NUTRIENT LOADS IN STREAMFLOW FROM SANDY SOILS IN FLORIDA,
Florida Univ., Gainesville. Dept. of Agricultural Engineering.
K. L. Campbell.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 5, p 1115-1120, September-October 1979. 8 Fig, 8 Tab, 12 Ref.

Descriptors: *Streamflow, *Nutrients, *Agricultural watersheds, *Land use, *Florida, Fertilizers, Precipitation(Atmospheric), Rainfall, Runoff, Agricultural runoff, Soils, Pollutants, Nitrates, Ammonia, Phosphorus, Phosphorus compounds, Watersheds(Basins), Hydrology, Path of pollutants, Water pollution, Water pollution sources.

Two agricultural watersheds with different land uses were instrumented to determine water quantity and quality measurements. Nitrogen and phosphorus loads in streamflow were about proportional to the flow volume. Nutrient losses in streamflow were very small when compared with the other components of nutrient balances in the two observed watersheds. Nitrogen and phosphorus losses in runoff were equivalent to about 5% of the commercial fertilizer applied and were less than the amounts received by the land area in precipitation. (Sims-ISWS)

OXYGEN DEFICIT--PHOSPHORUS LOADING RELATION IN LAKES,
Washington Univ., Seattle.
E. B. Welch, and M. A. Perkins.
Journal of the Water Pollution Control Federation, Vol 51, No 12, p 2823-2828, December 1979. 3 Fig, 1 Tab, 13 Ref.

Descriptors: *Dissolved oxygen, *Phosphorus, *Lakes, *Eutrophication, Hypolimnion, Model studies, Mathematical models, Oxygen, Oxygen demand, Water quality, Water pollution, Pollutants, Path of pollutants, Chemicals, Limnology, Oxygen depletion, Phosphorus loading.

Oxygen deficit rate in 26 lakes was found to be positively correlated with phosphorus loading normalized for flushing rate with an r of 0.73. The limit for eutrophic waters of 550 mg O2/sq m per day proposed by Mortimer has considerable merit if the regression equation found here is applied to Vollenweider's critical limit for annual, areal P loading = 200(Z sub rho) to the 0.5 power. The predicted oxygen deficit from that loading would result in stressful oxygen levels for hypolimnion-seeking fish during late summer. (Sims-ISWS)

IMPACT OF DEVELOPMENT ON WATERSHED HYDROLOGIC AND NUTRIENT BUDGETS,
Wisconsin Univ.-Madison. Center for Biotic Systems.
V. J. Watson, O. L. Loucks, J. Mitchell, and N. L. Clesceri.
Journal of the Water Pollution Control Federation, Vol 51, No 12, p 2876-2885, December 1979. 2 Fig, 4 Tab, 28 Ref. NSF DEB76-11776, DEB76-12294.

Descriptors: *Nutrients, *Lakes, *Nitrogen, *Phosphorus, Runoff, Chemicals, Pollutants, Eutrophication, Urbanization, Land development, Drainage, Watersheds(Basins), Hydrology, Limnology, *Lake George(NY), *Lake Wingra(WI).

This study assessed the impact of development on the hydrologic and nutrient budgets of contrasting watershed systems. Nutrient yields from the watersheds of oligotrophic Lake George (New York) and eutrophic Lake Wingra (Wisconsin) were estimated from measured nutrient concentrations and hydrologic flows and from hydrologic budget computations and were compared to reconstructed presettlement yields. Development-induced changes within the watersheds have altered phosphorus budgets more than nitrogen budgets, but the greatest impact on the Lake George budget comes from nitrogen-enriched precipitation. The Lake Wingra watershed appears to have been most affected by the alteration of its hydrology and morphology. (Sims-ISWS)

RELATIONSHIPS BETWEEN STREAM DISCHARGE AND YIELD OF DISSOLVED SUBSTANCES FROM A COLORADO MOUNTAIN WATERSHED,
Colorado Univ., Boulder. Dept. of Environmental, Population, and Organismic Biology.
W. M. Lewis, Jr., and M. C. Grant.
Soil Science, Vol 128, No 6, p 353-363, December 1979. 4 Fig, 1 Tab, 33 Ref.

Descriptors: *Discharge(Water), *Chemicals, *Watersheds(Divides), *Mountains, *Colorado, Sampling, Chemical analysis, Data processing, Streamflow, Ions, Cations, Nitrogen, Nitrogen compounds, Phosphorus, Carbon, Sodium, Nutrients, Magnesium, Calcium, Runoff, Path of pollutants, Water pollution sources.

The dependence of concentration and yield of dissolved substances on water discharge was studied over a 150-week period in the watershed of Como Creek, Colorado, near the Continental Divide. Substances were divided into three groups on the basis of relationship between concentration and discharge: (1) substances whose concentrations decrease with increasing discharge (HC03(-), N03(-), Ca(2+), Mg(2+), Na(+)); (2) substances whose concentrations show no trend with discharge (NH4(+), dissolved organic phosphorus and nitrogen, K(+), S04(2-)); (3) substances whose concentrations increase with increasing discharge (dissolved organic carbon, H(+), P04(3-)). The concentration-discharge relationships were compared between years and generally showed evidence of a common slope between years, even though discharge and weather varied considerably between years. Mean concentrations between years were compared statistically at a common discharge and showed no significant differences between years, suggesting common control mechanisms between years for a given substance. Substances were also compared with respect to yield (product of concentration and discharge). Three categories of yield response to increasing discharge were identified. All showed increasing yield with increasing discharge but with: (1) yield increasing slower than discharge (HC03(-), N03(-), Ca(2+), Mg(2+), Na(+)); (2) yield increasing at the same rate as discharge (NH4(+), DON); (3) yield increasing faster than discharge (DOP, K(+), S04(2-), DOC, H(+), P04(3-)). Simple groundwater-precipitation mixing models are not adequate to explain these differences in concentration and yield responses to discharge. A satisfying mechanism to explain the differences between responses of dissolved substances to discharge must take into account not only mixing but also the chemical reaction of incoming precipitation with soil and soil water and the intensity of biological demands for the substances. A MODEL FOR EVALUATING RUNOFF-QUALITY IN METROPOLITAN MASTER PLANNING,
Water Resources Engineers Inc., Walnut Creek, CA.
L. A. Roesner, H. M. Nichandros, R. P. Shubinski, A. D. Feldman, and J. W. Abbott.
Hydrologic Engineering Center, Technical Paper No 58, April 1974. 80 p, 25 Fig, 19 Tab, 13 Ref.

Descriptors: *Urban runoff, *Water quality, *Model studies, *Cities, *Planning, Watersheds(Basins), Runoff, Storm runoff, Hydrology, Runoff coefficient, Depression storage, Water pollution sources, Storm drains, Roads, Discharge(Water), Biochemical oxygen demand, Combined sewers, Water pollution, Pollutants, Nitrogen, Chemical oxygen demand, Data collections, Rainfall, Overflow, Infiltration rates, Catch basins.

The purpose of this document was to present an analytical method that can be used in the preliminary planning stage in the development of a pollution control program. The method has been coded into a computer program called STORM (Storage, Treatment, Overflow, and Runoff Model). This program represents a method of analysis to estimate the quantity and quality of runoff from small, primarily urban, watersheds. Nonurban areas may

also be considered. Land surface erosion for urban and nonurban areas is computed in addition to the basic water quality parameters of suspended and settleable solids, biochemical oxygen demand, total nitrogen, and orthophosphate. The purpose of the analysis is to aid in the selection of storage and treatment facilities to control the quantity and quality of urban stormwater runoff and land surface erosion. The model considers the interaction of eight variables: (1) precipitation, (2) air temperature for snowpack accumulation and snowmelt, (3) runoff, (4) pollutant accumulation on the land surface, (5) land surface erosion, (6) treatment rates, (7) storage, and (8) overflows from the storage/treatment system. Items (3), (4), and (5) are related to land use. Land uses accounted for in the model include: single family residential, multiple family residential, commercial, industrial, parks, and nonurban or undeveloped areas. The program is designed for use with many years of continuous hourly precipitation records. It is a continuous simulation model but may be used for selected single events. This program is available for the IBM 360/50, UNIVAC 1108, and CDC 6600 or 7600 computer systems. It requires about 35,000 words of core storage and a FORTRAN IV compiler that accepts multiple ENTRY statements. (Humphreys-ISWS)

EUTROPHICATION, MINUTE ALGAE AND INEFFICIENT GRAZERS,
Oslo Univ. (Norway). Inst. of Zoology.
J. P. Nilssen.
Memorie dell'Istituto Italiano di Idrobiologia, Vol 36, p 121-138, 1978. 3 Fig, 101 Ref.

Descriptors: *Trophic level, *Nutrients, *Aquatic algae, *Lakes, Productivity, Herbivores, Predation, Eutrophication, Oligotrophy, Phosphorus, Copepods, Invertebrates, Nannoplankton, Cyanophyta, Phytoplankton.

The processes leading from an oligotrophic to a eutrophic state and the reverse are not simple functions of P-loadings. A number of stabilizing and de-stabilizing factors are put into action during these processes. One of the most significant of these includes changes in the grazer community due to increased size-selective predation from both fish and invertebrate predators, mainly cyclopoid copepods. This results in decreased control of nannoplankton outbursts, with subsequent nutrient depletion and low water transparency. These conditions are favourable for BG algal growth. A rapid way to restore the lake would probably be to decrease predation pressure on large filter feeders. Simultaneously the external loadings must be decreased. (Deal-EIS)

ECOLOGICAL EFFECTS OF DISPERSANTS IN THE UNITED KINGDOM,
Society of Petroleum Industry Biologists, Los Angeles, CA.
E. B. Cowell.
In: Chemical Dispersants for the Control of Oil Spills, ASTM STP 659, L. T. McCarthy, Jr., G. P. Lindblom and H. F. Walter, Eds., American Society for Testing and Materials, p 277-292, 1978. 4 Fig, 4 Tab, 36 Ref.

Descriptors: *Toxicity, *Bioassay, *Oil spills, Oil, Organic compounds, Environmental effects, Aquatic life, Water pollution control, Shrimp, Crab, Clams, Mortality, Seasonal, Coasts, Surfactants, *Dispersants, *Oil dispersants.

The problems associated with the toxicity of dispersants at the time of the Torrey Canyon disaster are described together with subsequent developments to reduce toxicity. The problems of laboratory bioassay and its limitations in ecological prediction are reviewed in relation to dispersant concentrations that are reached under field use. Problems of the use and ecological effects of dispersants in shore cleaning are described in association with practical aspects of safe application and limitations. The author concludes that modern dispersant formulations can be used with minimum ecological risk provided the application is done with care by trained operators. It is stressed that even the most recently developed materials should not be used on areas of vascular plants such as salt marshes and mangroves. The lack of adequate research precludes recommending dispersants to treat oil spillage in freshwater rivers and lakes unless the bodies of water are extremely large. (Deal-EIS)

G. I. Kovaleva.
The Soviet Journal of Marine Biology, Vol 5, p 48-52, 1979. 4 Tab, 15 Ref.

Descriptors: *Oil, *Toxicity, *Fish physiology, Animal metabolism, Biochemistry, Carbohydrates, Mode of action, Cytological studies, Animal pathology, Chemical reactions, *Tissue analysis, *Liver, *Glucose, *Solea, *Spicara.

Glucose production by isolated sections of the liver of picarel (Spicara smaris L.) and Black Sea sole (Solea lascaris nasuta Pallas) during poisoning by dissolved petroleum is studied. It is shown that in vitro petroleum in a concentration of 1.8 and 3.0 microg/ml increases the production of glucose by the liver sections. Poisoning of fishes in vivo reveals hyperglycemia, a reduction in the content of glycogen in the liver, and also a decrease in the production of glucose by the isolated liver sections. The possible causes of these phenomena are discussed. The author assumes there is active detoxification of carbohydrates of petroleum in the liver which is accompanied by losses of energy resources and consumption of glucose. (Deal-EIS)

In: IVes journees d'etudes sur les pollutions ma-

rines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 381-384, 1979. 6 Ref, (English abstract).

Descriptors: *Detergents, *Path of pollutants, *Mathematical models, Methodology, Chemical wastes, Chemical properties, Persistence, Domestic wastes, Water pollution sources, Monitoring, Toxicity, Lethal limit, Benthic fauna, Mediterranean Sea.

An attempt to assess the input per day of anionic detergents into the Mediterranean Sea was made. Furthermore, dispersion, persistency and dilution were calculated in relation to variable fluxes and meteorological conditions. By means of a mathematical model, we have shown that detergents are better tracers of pollutant dispersion than dilution sheet. Concentrations found in the whole prospected region were very often sufficiently high to perturb the physiology and the development of many zooplanktonic species. (Deal-EIS)

CONCENTRATION OF THE HERBICIDE 2,4-D BY SOME HIGHER WATER PLANTS,
Kharkov Vodokanalniiproekt Inst. (USSR).
A. A. Titova.
Hydrobiological Journal, Vol 14, No 4, p 96-97, 1978. 1 Fig, 7 Ref.

Descriptors: *2,4-D, *Aquatic plants, *Pesticide kinetics, Herbicides, Chlorinated hydrocarbon pesticides, Path of pollutants, Radiochemical analysis, Tracers, Chemical properties, Absorption, *Bioaccumulation, *Tissue analysis, *Salvinia, *Duckweed, *Elodea, *Water milfoil, *Hornwort.

It has been established in the course of radioisotope research that there are differences in the resistance of higher water plants (Salvinia, duckweed, Elodea, water milfoil, hornwort) to the herbicide 2,4-D and in their capacity to concentrate it. The first three species are active concentrators of this preparation. The established accumulation capacity of the higher water plants confirms their potential role in water protection. (Deal-EIS)

T. L. Shchekaturina, and O. G. Mironov.
Journal of Ichthyology, Vol 18, No 6, p 1026-1029, 1978. 6 Fig, 1 Tab, 9 Ref.

Descriptors: *Organic compounds, *Absorption, *Fish physiology, Chemical analysis, Animal metabolism, Path of pollutants, Marine fish, Lipids, Chemical properties, Chromatography, *Tissue analysis, *Bioaccumulation, *Mediterranean Sea, *Paraffins.

Bottom and pelagic fish, the hake (Merluccius merluccius), the mackerel (Scomber scombrus), the scad (Trachurus trachurus), and the spiny dogfish (Squalis acanthias) caught in the western Mediterranean were analysed for hydrocarbon content. Saturated hydrocarbons in the organs and tissues of the fish ranged from 19.3 to 318.8 microg/100 g wet weight. C15, C17 and C19 accounted for the highest percentage. Of the saturated hydrocarbons with a branched chain pristane was found in considerable quantities. (Deal-EIS)

The uptake, accumulation and depuration of a labelled hydrocarbon (14C-1-naphthalene) by the marine annelid Arenicola marina were studied. Naphthalene was chosen because it is an important component of oil and is known to be toxic to marine organisms. The bioavailability of the hydrocarbon to the worm from contaminated sediment is examined and the results discussed with reference to the rehabilitation of oiled environments, as A. marina is thought to be capable, in high numbers, of greatly reworking sediments. Marine Biology, Vol 55, p 133-141, 1979. 4 Fig, 3 Tab, 31 Ref.

Descriptors: *Cadmium, *Absorption, *Mussels, Path of pollutants, Heavy metals, Metabolism, Animal metabolism, Animal physiology, Feeding rates, *Mercury, Cytological studies, Mode of action, Electron microscopy, Biological membranes, *Tissue analysis, *Bioaccumulation, *Midgut gland.

Cadmium uptake has been studied in starved and fed Mytilus edulis L. It is suggested that fairly elevated cadmium contents in fed mussels are not due to contaminated food, but to increased pumping rate when food is available. Highest concentration and main body burden are found in the midgut gland. Transport via haemolymph, and selective discrimination at the basement lamina of the mid-gut gland tubuli are regarded as mainly responsible for accumulation. Mercury seems to be processed in a similar was as cadmium. In the tubuli, both metals are immobilized in membrane-bound vesicles, which are finally defaecated. (Deal-EIS)

Horikoshi.
European Journal of Applied Microbiology and Biotechnology, Vol 8, p 207-215, 1979. 11 Fig, 1 Tab, 10 Ref.

Descriptors: *Cadmium, *Absorption, *Chlorella, Chlorophyta, Scenedesmus, Chlamydomonas, Aquatic algae, Path of pollutants, Heavy metals, Metabolism, Membrane processes, Hydrogen ion concentration, *Bioaccumulation, *EDTA.

The accumulation of cadmium from aqueous systems by various green microalgae was investigated with focus on Chlorella regularis as it is known to concentrate large amounts of heavy metals. The amount of cadmium absorbed by Chlorella cells was rapid during the first 30 min following addition of cadmium and then continued to be absorbed more slowly. The uptake of cadmium by Chlorella was not markedly affected by temperature or metabolic inhibitors. Most of the cadmium absorbed by Chlorella cells was easily released by EDTA. The amount of cadmium absorbed differed markedly with the pH value of the solution and was inhibited by the presence of other divalent cations. Heat-killed Chlorella cells took up cadmium to a greater degree than living ones. From these results, it was considered that the uptake of cadmium into Chlorella cells was not directly mediated by metabolic processes, rather it appeared completely dependent upon physico-chemical adsorption on the cell surface. The ability to accumulate cadmium was species specific and found to be (in decreasing order): Chlamydomonas reinbardtii > Chlorella regularis > Scenedesmus bijuga > Scenedesmus obliquus > Chlamydomonas angulosa > Scenedesmus chlorelloides. (Deal-EIS)

Z. Zbytniewski, G. Drewa, F. Pautsch, and T. Dabrowska.
Kieler Meeresforschungen, Vol 4, p 366-369, 1978. 1 Tab, 12 Ref.

Descriptors: *Oil, *Detergents, *Toxicity, *Shrimp, *Crabs, Oil spills, Surfactants, Ions, Animal physiology, Animal metabolism, Sodium, Calcium, Chlorides, Magnesium, Potassium, Mode of action, Membrane processes, Permeability, Enzymes, Biochemistry, Crustaceans, Oil pollution, *Crude oil, *Tissue analysis.

Solutions of detergent or crude oil of 10 ppm, 50 ppm, and 100 ppm after 48-96 hours of exposure induce significant changes in the ionic composition of the hemolymph of the shrimp Crangon crangon and the crab Rhithropanopeus harrisi. The concentrations of sodium, calcium, and chloride ions decrease, whereas the concentration of potassium increases in both species exposed to both pollutants. The magnesium ion concentration decreases in the hemolymph of the shrimp incubated in solutions of detergent and in the crab incubated in the water containing crude oil. It is suggested that changes in the ionic composition of the hemolymph of the studied shrimps and crabs under influence of both pollutants are possibly brought about by alteration of cell membrane permeability and action on some enzyme activities. (Deal-EIS)

ACTIVITY OF LIVER FRUCTOSE 1,6 BIPHOSPHATASE IN RAINBOW TROUT HELD IN DIFFERENT CONCENTRATIONS OF INDISSOCIATED AMMONIA (IN ITALIAN),
Genoa Univ. (Italy). Ist. di Zoologio.
A. Arillo, L. Lamba Doria, and C. Margiocco.
Memorie dell'Istituto Italiano di Idrobiologia, Vol 36, p 163-170, 1978. 1 Fig, 4 Tab, 20 Ref. (English Summary).

Descriptors: *Enzymes, *Toxicity, *Ammonia, Rainbow trout, Hydrogen ion concentration, Biochemistry, Proteins, Fish physiology, Animal metabolism, Phosphorus compounds, Chemical analysis, Liver fructose 1,6-biphosphatase, *Tissue analysis.

Liver fructose 1,6-biphosphatase was tested in trout (Salmo gairdneri) kept in different ambient concentrations of NH3. Results show a significant decrease of fru-P2-ase activity (pH 7.5) in treated specimens after 60 min. incubation of extracts. The ratio between the observed activities at pH 7.5 and 9.5 also decreases significantly in treated specimens. These results are indicative of increased proteolytic activity in NH3 treated animals. (Deal-EIS)

S. S. Buggiani, and S. Rindi.
Bulletin of Environmental Contamination & Toxicology, Vol 24, p 152-155, 1980. 1 Tab, 21 Ref.

Descriptors: *Lead, *Toxicity, *Ducks, *Electrolytes, Membrane processes, Osmosis, Path of pollutants, Animal metabolism, Salts, Heavy metals, *Osmoregulation, *Tissue analysis, *Blood chemistry.

In a controlled experiment ducks were force-fed standard lead doses for 8 weeks. Data collected at the end of exposure consisted of; weight; hemoglobin value; number of red blood cells (RBCs); and lead quantity in the blood. All the ducks treated showed various degrees of anemia and signs of lead poisoning. After sacrifice, the lead concentration in the nasal glands was also quantified. Lead concentrations in the nasal glands were much higher than in the blood. It was suggested that this indicated either the involvement of these glands in the elimination of lead or the impairment of transport processes at the cellular membrane levels. (Deal-EIS)

THE CYTOCHEMICAL DISTRIBUTIONS OF ZINC (ZN II) AND IRON (FE III) IN THE COMMON MUSSEL, MYTILUS EDULIS, AND THEIR RELATIONSHIP WITH LYSOSOMES,
Institute for Marine Environmental Research, Plymouth (England).
D. M. Lowe, and M. N. Moore.
Journal of the Marine Biological Association of the United Kingdom, Vol 59, p 851-858, 1979. 1 Tab, 36 Ref.

Descriptors: *Cytological studies, *Mussels, *Zinc, *Iron, Metals, Path of pollutants, Animal metabolism, Animal physiology, Animal populations, Absorption, Enzymes, Biochemistry, *Tissue analysis, *Bioaccumulation, *Bioavailability.

Zinc (Zn II) and iron (Fe III) were demonstrated histochemically in cytoplasmic inclusions shown to be lysosomes in a number of cell types in Mytilus edulis. The cellular distribution of the metals differed between the sexes; males were shown to have more zinc (Zn II) in the kidney than females, the latter appearing to use oocytes as an additional means of excretion. Differences in cellular distribution of the metals was also demonstrated between the two populations studied probably reflecting availability of the metals in their respective environment. It is proposed that detoxication of the metal ions may be achieved by compartmentation in the lysosomal-vacuolar system. (Deal-EIS)

A LIGHT MICROSCOPIC STUDY OF THE ACTION OF SODIUM ORTHOVANADATE ON THE GILLS OF FRESH-WATER AND SEA-WATER EELS (ANGUILLA ANGUILLA L.),
Natural Environment Research Council, Aberdeen (Scotland). Inst. of Marine Biochemistry.
K. F. Kelly, B. J. Pirie, M. V. Bell, and J. R. Sargent.
Journal of the Marine Biological Association of the United Kindgom, Vol 59, p 859-865, 1979. 2 Fig, 20 Ref.

Descriptors: *Metals, *Toxicity, *Eels, Mode of action, Cytological studies, Sodium compounds, Microscopy, Animal physiology, Chemical properties, *Vanadium, *Vanadium compounds, *Tissue analysis, *Gills.

Gills of fresh-water and sea-water eels were perfused at a constant pressure with physiological Ringer containing 10(-6)M sodium orthovanadate and examined by light microscopy. The secondary gill filaments were markedly vasoconstricted in both fresh-water and sea-water fish although the peripheral blood route around the secondary filaments was unaffected. The central venous space in the primary filaments was largely unaffected. Significant constriction of both afferent and efferent arteries on the primary filament occurred. We conclude that orthovanadate vaso-constricts eel gills mainly at the level of the secondary filaments. The study also emphasizes that chloride cells are located on both the primary and secondary filaments of fresh-water gills but solely on the primary filaments of sea-water gills. (Deal-EIS)

Plant Physiology, Vol 64, No 5, p 892-895, November 1979. 3 Fig, 2 Tab, 28 Ref.

Descriptors: *Aquatic algae, *Anaytical techniques, *Carbon dioxide, *Hydrogen ion concentration, *Photosynthesis, Gas chromatography, Flame photometry, Chlorella pyrenoidosa, Chlorella vulgaris, Cyanophyta, Chlamydomonas, Anabaena, Coccochloris, Phormidium, Diatoms, Cyclotella, Chlorophyta, Oxygen, Ionorganic compounds, Biochemistry, Cultures, Acidity, Alkalis(Bases).

Measurements of total dissolved algal inorganic carbon by acid release as CO2 shows that CO2 compensation points at alkaline pH are uniformly low. It is suggested that these low CO2 compensation points are maintained by an active bicarbonate uptake by algae especially at alkaline pH. Measurement of CO2 compensation points of 16 freshwater algae were made using gas chromatography in conjunction with flame ionization. The compensation points at acid pH range 4.8-41.5 microl/l. Lowest values are for Chlorella pyrenoidosa and C. vulgaris, 5.8 and 4.8 microl/l respectively, whereas those of most other algae range 15-20 microl/l. Lowering the medium O2 concentration at this pH does not have marked effects on compensation points. Compensation points for unicellular green algae, Chlorella and Chlamydomonas, blue-green algae Anabaena, Coccochloris and Phormidium, and diatom Cyclotella are not affected by changes in O2 concentration whereas compensation points of other species decrease, at most by 50%. In contrast to compensation points at acid pH, CO2 compensation points at alkaline pH are uniformly low. At air-saturated O2 concentrations, compensation points of all species range 0.2-7.2 microl/l and lowering O2 concentrations has no marked effects on any compensation points. Low, CO2-insensitive compensation points of algae are characteristic of C4 plants. (Harris-Wisconsin)

POLLUTION OF THE MARINE ENVIRONMENT,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
D. C. Malins.
Environmental Science & Technology, Vol 14, No 1, p 32-37, January 1980. 2 Fig, 2 Tab, Illust.

Descriptors: *Water pollution effects, *Baseline studies, *Chemical wastes, *Oil pollution, Environmental effects, Resources development, Coasts, Ecosystems, *Outer Continental Shelf.

Many chemicals created to satisfy technological and economic demands will eventually find their way into the marine system. In addition an estimated four million metric tons of petroleum enter the marine environment each year. To protect our natural resources the effects of chemical pollutants on marine organisms and their habitats need to be studied. In the Environmental Conservation Division of the Northwest and Alaska Fisheries Center teams made up of specialists in analytical chemistry, bio-chemistry, vertebrate and invertebrate pathology, electron microscopy, immunology, and behavioral biology are attempting to solve problems involved in identifying chemical pollution in marine environments and in relating the findings to possible alterations in the health of marine organisms. Preliminary findings indicate that interactive effects between two pollutants in marine organisms account for substantial alterations in certain biochemical systems and in cellular morphology. Interactive effects appear to bring about major alterations in biological systems of marine fishes. Reams of data acquired on the effects of exposing organisms to a single contaminants will be examined and research expanded to determine which interactions occur and the degree of their impact. THE TSESIS OIL SPILL: ITS IMPACT ON THE COASTAL ECOSYSTEM OF THE BALTIC SEA,
Institute of Water and Air Pollution Research, Studsvik (Sweden).
O. Linden, R. Elmgren, and P. Boehm.
Ambio, Vol 8, No 6, p 244-253, 1979. 13 Fig, 26 Ref.

Descriptors: *Oil spills, *Water pollution effects, *Ecosystems, Coasts, Environmental effects, *Outer Continental Shelf, *Baltic Sea, Tsesis oil spill, Soviet tankers.

The Tsesis study describes an attempt to investigate the full spectrum of effects of an oil spill on the ecosystem of a rather sheltered coastal archipelago in the atidal brackish Baltic Sea. The study demonstrated a number of effects of oil on various types of organisms. In general, however, the impact seems to have been of relatively short-term nature in the pelagic system, a conclusion supported also by the results of the investigations following the Torrey Canyon and Argo Merchant accidents. Increases in primary production among phytoplankton in impacted areas have been observed earlier. The stimulation of primary production in the area affected by the Tsesis oil spill is probably related primarily to the higher phytoplankton biomass in the area. The observed decrease of zooplankton in the vicinity of the ship was undoubtedly due to the acute toxic effects of the oil. The results of the investigations of the effects of the Tsesis oil on littoral communities indicate severe acute effects on all major faunal groups. These results together with results from a study of a very similar spill in the Stockholm archipelago suggest that complete recovery of a littoral community under these circumstances will take two to three years. MONITORING THE MARINE ENVIRONMENT, PROCEEDINGS OF A SYMPOSIUM HELD AT THE ROYAL GEOGRAPHICAL SOCIETY, LONDON, ON 28 AND 29 SEPTEMBER 1978.
Symposia of the Institute of Biology No 24, 1979. 217 p, Institute of Biology, London.

Descriptors: *Monitoring, *Water pollution effects, *Environmental effects, Resources development, Baseline studies, Oil pollution, Coasts, Surveys, Ecosystems, *Outer Continental Shelf, North Atlantic Ocean, North Sea, United Kingdom.

The theme of the symposium was the systematic observation of life in the sea and the effects of human activity on it. The Symposium brought together people interested in a wide range of topics in marine science. After the introduction on Marine Monitoring, the following papers were presented: Intertidal Surveillance; Monitoring the Effect of Oil pollution on Rocky Seashores; Systematic Surveys and Monitoring in Nearshore Sublittoral Areas Using Diving; Monitoring with Deep Submersibles; Continuous Plankton Records - Monitoring the Plankton of the North Atlantic and the North Sea; The Monitoring of Substances in Marine Waters for Genetic Damage; Monitoring Whale and Seal Populations; Biological Monitoring Around an Oil Refinery; Monitoring Radioactivity in the Marine Environment; Monitoring the Effects of Domestic and Industrial Wastes; and Marine Wildlife Conservation in the Coastal Zone. (See W80-03014 thru W80-03024) (Sinha - OEIS)
W80-03013

INTERTIDAL SURVEILLANCE,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
W. E. Jones, A. Fletcher, S. J. Bennell, B. J. McConnell, and A. V. L. Richards.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 1-23, 1979. 12 Fig, 2 Tab, 26 Ref.

Descriptors: *Monitoring, *Intertidal areas, *Water pollution effects, Baseline studies, Environmental effects, Resources development, *Outer Continental Shelf, Wales(UK).

The importance of baseline studies of intertidal areas to a proper assessment of the environmental effects of pollution is described. Information is given on the coastal surveillance program established around the coast of Anglesey and in either direction along the mainland coast east and west of the island. Some trends and deductions from the collected and partially processed data are mentioned. Emphasis is placed on changes resulting from natural events so that better judgments may be made following a pollution event. (See also W80-03013) (Sinha-OEIS)

MONITORING THE EFFECT OF OIL POLLUTION ON ROCKY SEASHORES,
University Coll. of Swansea, (Wales). Dept. of Zoology.
A. Nelson-Smith.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 25-53, 1979. 7 Fig, 50 Ref.

Descriptors: *Monitoring, *Baseline studies, *Shores, *Water pollution effects, *Environmental effects, Oil pollution, Resources development, *Outer Continental Shelf, Rocky seashores, British Isles.

Any pronouncement about the effects of pollution upon the sedentary life of a stretch of seashore implies a knowledge both of the previous, untainted state of that shore and of the magnitude of changes which would have taken place during the period of pollution, but from purely natural causes. Many forms of marine pollution have exerted their influence at a low intensity for such a period of time that the shore biota may not been observed in their previous unaffected state or, perhaps at best, such observations may have been recorded only in a manner which does not permit careful comparison with their present condition. Even where clearly defined changes have been reliable demonstrated, it may be difficult to assign them to a particular influence (such as a polluting discharge) when others (for example, gradual climatic changes, unusual extremes of temperature, epidemics of disease, or invasions by predators, parasites, and exotic competitors) could have had a powerful an effect. The author considers all of the uses which can be made of work which was originally carried out for purposes other than monitoring of pollution. He then discusses the applicability of various methods specifically for this purpose. (See also W80-03013) (Sinha - OEIS)
W80-03015

SYSTEMATIC SURVEYS AND MONITORING IN NEARSHORE SUBLITTORAL AREAS USING DIVING,
Field Studies Council, Penbroke (England). Pollution Research Unit.
K. Hiscock.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 55-74, 1979. 4 Fig, 25 Ref.

Descriptors: *Monitoring, *Surveys, *Water pollution effects, *Environmental effects, Baseline studies, Resources development, Scuba diving, *Outer Continental Shelf, Nearshore sublittoral areas.

The use of diving in marine biology in British waters has accelerated in recent years and a description of available techniques and equipment has been prepared for publication by the present author. This paper is concerned with the strategy of carrying out biological studies using diving. The type of data collected will depend on the information needed to satisfy the aims of the survey, the time available for collection and processing of data, the methods of analysis to be used, and the level of accuracy which is possible. A knowledge of the environmental variables likely to affect the distribution and abundance of species will be required at the planning stage of a survey, particularly if it is intended to study the effect of one physical or chemical factor and reduce the variation in others by careful selection of sites. The following factors are likely to be important: exposure to wave action and tidal streams; light; depth; suspended sediment concentration; the annual temperature range; salinity differences; geographical location; substrate type; and predator or dominant cover. MONITORING WITH DEEP SUBMERSIBLES,
Woods Hole Oceanographic Institution, MA.
G. T. Rowe.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 75-85, 1979. 6 Fig, 19 Ref.

Descriptors: *Monitoring, *Environmental effects, *Water pollution effects, Baseline studies, Ocean environments, Resources development, Research facilities, *Outer Continental Shelf, Submersibles, Deep Submergence Research Vessels(DSRV), DSRV Alvin.

The open ocean, because it appears so vast and far removed, has often been used as a recipient of urban and industrial wastes. Life in the shallow productive waters is vitally dependent on processes in the deep ocean. To know the consequences of using the deep-sea for waste disposal, monitoring is called for, but the great depths present formidable barriers to simple monitoring programs. One possible approach to monitoring great depths is the use of Deep Submergence Research Vessels (DSRVs). The Woods Hole Oceanographic Institution has operated DSRV Alvin since 1964 and it has been used in a variety of disciplines. Among them, increasingly, is the investigation of the effects of pollutants on the deep-sea biota and environment. The history of Alvin, its major accomplishments, and how it is now being used in deep-sea environmental quality programs is described. (See also W80-03013) (Sinha - OEIS)
W80-03017

CONTINUOUS PLANKTON RECORDS: MONITORING THE PLANKTON OF THE NORTH ATLANTIC AND THE NORTH SEA,
Institute for Marine Environmental Research, Plymouth (England).
J. M. Colebrook.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 87-102, 1979. 11 Fig, 12 Ref.

Descriptors: *Monitoring, *Plankton, *Water pollution effects, *Environmental effects, Baseline studies, Surveys, Coasts, Resources development, *Outer Continental Shelf, North Sea, North Atlantic Ocean.

Relationships between plankton and environment have been presented to provide examples of the kinds of relationship that are found and to illustrate some of the problems involved in their interpretation. There has been a marked improvement in techniques of data acquisition in recent years, particularly in the field of satellite observations, and there has been a considerable improvement in the availability of data relating both to historical series and to current observations. These trends imply that there is ample scope for further work along these lines which could provide the bases for more refined interpretations of the relationships between plankton and environment. As the environment is in a state of continuous change, the existence of a transient phase can complicate the relationships between concomitant values of input and response. In addition, plankton populations obviously exhibit persistence, for periods at least related to their generation times, and this imposes certain characteristics on sets of observations expressed as time-series. Given the limitations in the observational data, these problems can be solved only by the development of models of the processes involved. (See also W80-03013) (Sinha - OEIS)
W80-03018

THE MONITORING OF SUBSTANCES IN MARINE WATERS FOR GENETIC DAMAGE,
University College of Swansea, (Wales). Dept. of Genetics.
J. M. Parry, and M. A. J. Al-Mossawi.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 103-113, 1979. 1 Fig, 6 Tab, 6 Ref.

Descriptors: *Monitoring, *Genetics, *Water pollution effects, *Environmental effects, Baseline studies, Chemical wastes, Coasts, Resources development, *Outer Continental Shelf, Mutagenic agents, Mytilus edulis.

The use of the marine environment as a sink for the disposal of chemicals both deliberately and accidentally suggests that at least a fraction of the living organisms found in the seas and oceans may be exposed to potentially mutagenic agents. Such exposure may result in changes in the genetic architecture of marine populations and if such agents enter food chains they may lead to the unwitting exposure of human populations. The assay of the seas and oceans for the presence of mutagenic chemicals can be performed in two fundamentally different ways. One method involves chemically analysing ocean samples in order to identify constituent chemicals which may then be individually tested for mutagenic activity. The second approach involves the collection of ocean samples, concentration of the constituents, and the exposure of the resulting concentrate to a range of mutagenic screening systems. An assay system has been developed based upon the extraction of tissues derived from the mussel Mytilus edulis and the screening of these extracts for mutagenic activity using a number of microbial indicator species. Although results demonstrate the presence in mussels of chemicals which cause mutation in microbes, they provide no direct information on the potential of these chemicals to produce similar changes in the cells of higher organisms. The evaluation of their potential hazards will require the use of a range of test systems of more direct relevance to the organisms of concern. (See also W80-03013) (Sinha - OEIS)
W80-03019

MONITORING WHALE AND SEAL POPULATIONS,
British Antarctic Survey, Cambridge (England).
R. M. Laws.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 115-140, 1979. 3 Fig, 2 Tab, 88 Ref.

Descriptors: *Monitoring, *Mammals, *Water pollution effects, *Oil pollution, Environmental effects, Resources development, Baseline studies, Antarctic, *Outer Continental Shelf, Whales, Seals, Southern Ocean.

Large-scale oil exploration and exploitation in inshore and offshore areas is under way, and large industrial plants producing noxious effluents are being established in areas where they could affect marine mammal populations. Even the Antarctic is not immune. So far there is no evidence that marine mammals are seriously affected by oil-spills but the less obvious effects of disturbance, such as noise, may be important. Because of the vast areas involved and the expense, the immediate need is for further coordination of efforts, the continuation and strengthening of projects already in operation, and the establishment of pilot projects to develop new techniques. Methods need to be standardized and calibrated and arrangements for storage and retrieval of data improved because records must be longer than a single worker's career. BIOLOGICAL MONITORING AROUND AN OIL REFINERY,
Imperial Coll. of Science and Technology, London (England). Dept. of Botany.
D. H. Dalby, E. B. Cowell, and W. J. Syratt.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 141-152, 1979. 3 Fig, 2 Tab, 9 Ref.

Descriptors: *Monitoring, *Oil pollution, *Water pollution effects, *Environmental effects, Ecosys-

tems, Baseline studies, Resources development, *Outer Continental Shelf, Norway, Oil refineries.

The approaches used in the biological monitoring studies carried out by ecologists of the British Petroleum Company at the Rafinor oil refinery at Mongstad on Fensfjord, 50 km NNW of Bergen, Norway are described. Some conclusions reached in regard to marine pollution are as follows: (1) if biological monitoring is employed, recording should be quantitative and in such a form that the data can be treated statistically; (2) variations in species abundance on rocky shores are often considerable from year to year, and these must be allowed for in assessing the magnitude of possible contamination; (3) no monitoring study of this kind should be carried out in a vacuum without a fairly full understanding of the general ecological processes taking place in the natural environment; and (4) biological data become more useful when the species studies are employed in a kind of bioassay and restricting the recording to rather few species of known tolerance and response. W80-03021

MONITORING RADIOACTIVITY IN THE MARINE ENVIRONMENT,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Radiobiological Lab.
N. T. Mitchell.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 153-170, 1979. 1 Fig, 5 Tab, 21 Ref.

Descriptors: *Monitoring, *Radioactivity, *Environmental effects, *Waste disposal, *Water pollution effects, Nuclear powerplants, Coasts, Estuaries, Resources development, *Outer Continental Shelf, United Kingdom.

An account of methods used in the UK to monitor the effects of controlled radioactive waste disposal from the generation of nuclear power on the marine environment is presented. Monitoring occupies an especially important role within the control structure for ensuring the safe disposal of radioactive waste, and its treatment explains this role and the use to which it is put. Marine environmental monitoring in the UK is essentially source-related and, designed and organized along critical path lines, provides a comprehensive surveillance system of the effects of operation of a large nuclear power programme. Monitoring is closely integrated with research programmes which also feed into the overall control system and so ensure that maximum information is gained from the effort available. (See also W80-03013) (Sinha - OEIS)
W80-03022

MONITORING THE EFFECTS OF DOMESTIC AND INDUSTRIAL WASTES,
Clyde River Purification Board, Glasgow (Scotland).
A. J. Newton, A. R. Henderson, and P. J. Holmes.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 171-179, 1979. 20 Ref.

Descriptors: *Monitoring, *Domestic wastes, *Industrial wastes, *Water pollution effects, Environmental effects, Baseline studies, Resources development, *Outer Continental Shelf, Ocean dumping.

The marine environment supports a wide variety of human activities including fishing and mariculture, commerce and transport, mineral exploitation, recreation, and waste disposal. All these activities have clear biological implications; however, it is on the coastal ecosystems adjacent to major centres of population that the impact of such activities, particularly waste disposal, is most pronounced. In order to prevent, reduce, or at least contain pollution by domestic and industrial effluents, the statutory authorities have had to embark on programmes of monitoring and research so that water quality criteria can be defined and the maximum permissible levels of pollutants established. (See also W80-03013) (Sinha - OEIS)
W80-03023

MARINE WILDLIFE CONSERVATION IN THE COASTAL ZONE,
Nature Conservancy, Abbots Ripton (England). Monks Wood Experimental Station.
R. Mitchell.
In: 'Monitoring the Marine Environment,' Symposia of the Institute of Biology No 24, p 181-193, 1979. 4 Ref.

Descriptors: *Monitoring, *Conservation, *Coasts, *Water pollution effects, Baseline studies, Environmental effects, Resources development, *Outer Continental Shelf, British Isles.

The necessity to develop a strategy for marine wildlife conservation in British coastal waters is in large part a reaction to the many conflicting activities in this zone which seem to grow both in type and magnitude, and in the area which they affect. The basis of a possible strategy for marine wildlife conservation in the littoral and shallow sublittoral areas of Britain's coastal zone is described. Survey, surveillance, and monitoring are discussed in relation to this strategy. The basic and inevitable conclusion is that enormous resources are needed both to fund all the tactical and strategic research required and to manage and maintain an adequate marine conservation strategy. THE DEVELOPMENT OF WATER QUALITY CRITERIA FOR AMMONIA AND TOTAL RESIDUAL CHLORINE FOR THE PROTECTION OF AQUATIC LIFE IN TWO JOHNSON COUNTY, KANSAS STREAMS,
Kansas Water Resources Research Inst., Manhattan.
R. H. Hazel, C. E. Burkhead, and D. G. Huggins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139561, Price codes: A08, in paper copy, A01 in microfiche. Project Completion Report, December 1979. 156 p, 26 Fig, 33 Tab, 86 Ref, 6 Append, OWRT A-088-KAN(1).

Descriptors: *Kansas, *Ammonia, *Chlorine, *Bioassay, *Water quality, Shiners, Sunfishes, Bass, Fish toxins, Crayfish, Benthos, Aquatic animals, Aquatic drift, Catfishes, Toxicity, Sewage effluents.

Mill Creek and Cedar Creek in Johnson County, Kansas, were sampled monthly from December 1977 through May 1979 to determine water quality data for the streams. Also studied were toxicity levels for selected stream fauna and fauna response to artificially stressed stream conditions. From the data, water quality criteria for ammonia and total residual chlorine (TRC) were developed. Both streams flow in a northerly direction and drain into the Kansas River, however, Mill Creek receives sewage treatment plant effluents while Cedar Creek does not. At each sampling site three samples were taken; one acid fixed for ammonia analysis, one for bacteriological testing, and one for other parameters such as pH, hardness, alkalinity, conductivity, and turbidity. Other on-site measurements were also made such as temperature and dissolved oxygen. Species used for the 96 hour acute toxicity test for ammonia and TRC include the orange throated darter, the red shiner, crayfish, and the riffle beetle. Bluegill sunfish were observed between the two test streams. Due to the sewage discharges Cedar Creek was much healthier with greater aquatic life diversity and low concentrations of pollutants. The orange throated darter was the most sensitive species to ammonia and the red shiner the most sensitive to TRC. Stream stress tests showed that the tested fish were more sensitive to stream stress. Maximum safe levels for ammonia and TRC were determined to be 0.07 mg/l and 0.02 mg/l respectively as 24 hour averages. (Seigler-IPA)

DIATOM AND CHRYSOPHYCEAN CYST PROFILES IN SEDIMENT CORES FROM TWO LINKED BUT CONTRASTING WELSH LAKES,
University Coll. of North Wales, Bangor. School of Plant Biology.
J. K. Elner, and C. M. Happey-Wood.
British Phycological Journal, Vol 13, No 4, p 341-360, 1978. 7 Fig, 4 Tab, 60 Ref.

Descriptors: *Paleolimnology, *Sedimentology, *Sampling, *Trophic level, History, Sediments, Oligotrophy, Eutrophication, Cores, Lake Padarn, North Wales, Lake Peris, Chrysophyta, Diatoms, Analytical techniques, On-site investigations, Wales.

Llyn Padarn and Llyn Peris, two small North Wales river-linked lakes, originally formed a single larger lake. Today they contain two contrasting algal communities. The diatom and chrysophycean cyst sequence found in long sediment cores from these lakes was studied to determine the historical extent of their trophic differences. Llyn Padarn 4.75 m long core represents c. 6,000 years, while Llyn Peris 2.1 m long core represents c. 900 years. Between 6,000 and 2,200 B.P., Llyn Padarn was acid-oligotrophic; about 2,200 years ago it became enriched. Asterionella formosa was a predominant diatom at that time. C. 2,000 B.P., the lake reverted to oligotrophy. At C. 900 B.P., Llyn Peris sediments were characterized by centric diatoms similar to those found in the Llyn Padarn sediments between C. 2,000 B.P. and the present. C. 200 B.P., Llyn Peris sediments began to show chemical changes traceable to extensive copper and slate mining near the lake. At that time Chrysophyceae became dominant in Llyn Peris while diatoms continued to abound in Llyn Padarn. A statistical analysis method is described for determining the precision of counting of the sediment samples. The most efficient counting and sampling procedure involves taking a single sediment sample from a depth horizon, preparing two replica slides, and counting the entire area of each slide. Comparison of vertical and horizontal distributions of these siliceous algae in replica sediments shows that vertical variation greatly exceeds horizontal variation; this proves that the sediment core sequence reflects changes in composition through time rather than variations in horizontal algal distribution. SORPTION OF PHOSPHATE BY DANISH LAKE SEDIMENTS,
Copenhagen Univ., Hillerod (Denmark). Freshwater-Biological Lab.
O. S. Jacobsen.
Vatten, Vol 33, No 3, p 290-298, 1977. 10 Fig, 3 Tab, 17 Ref.

Descriptors: *Sorption, *Absorption, *Adsorption, *Phosphates, Denmark, Trophic level, Sediment-water interfaces, Isotherms, Lakes, Mud-water interfaces, Langmuir isotherm, Freundlich isotherm, Phytoplankton, Cycling nutrients.

Sediment samples were collected during winter 1975-1976 from eight Danish lakes of different trophic level. Analyses of the sediments were carried out for purposes of studying sorption isotherms and their relationships to sediment composition. Results of the experiments confirm that the sorption mechanism in most sediments is a very rapid reaction. Changes in external concentrations of about 1 mg phosphorus/l occur within 4-8 hrs. Iron-oxid-hydroxids in active-state sediments are the main factor influencing the sorption capacity. The highest level of sorption was obtained in experiments with oxidized mud and lake water, and pH had the most influence on sorption capacities. In reduced mud only low sorption capacities were found as a result of reduction in the active iron content of the sediment. In organic and iron-poor sediments low sorption capacities or none at all were obtained. Sorption to iron-oxid-hydroxids is a chemosorption process and consequently has a maximum of sorption sites. Mathematically it can best be described by a Langmuir isotherm. Sorption to organic matter, clay, minerals, and inorganic surfaces must be regarded as adsorption, best described by a Freundlich isotherm. For natural sediments the ratio between chemosorption and

adsorption provides data for selecting the correct isotherm. (Harris-Wisconsin)
W80-03102

SPATIAL VARIABILITY OF PHYTOPLANKTON BIOMASS IN THE SURFACE WATERS OF LONG ISLAND,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
J. F. Lekan, and R. E. Wilson.
Estuarine and Coastal Marine Science, Vol 6, No 3, p 239-251, 1978, 8 Fig, 8 Ref.

Descriptors: *Phytoplankton, *Biomass, *Long Island Sound(NY), *Spatial distribution, Chlorophyll, Analytical techniques, Correlation analysis, Statistical methods, Temperature, Salinity, Wavelengths, New York.

The relative importance of interactions among various biological and physical processes is analyzed in terms of affects of these differences on varying sizes (intermediate to large-scale) of in-vivo chlorophyll-a observed in surface waters along a 192 km transect through eastern Long Island Sound and nearby coastal waters. Statistical analysis of records of chlorophyll-a, temperature and salinity confirms the existence of small structure in chlorophyll-a and larger structure in temperature and salinity. Cross-covariance analysis indicates that there is no correlation between the chlorophyll-a structure and that of temperature and salinity. The power spectra for these three variables are similar at wavelengths of 5-20 km, suggesting that structure at these wavelengths is determined by physical processes. At wavelengths shorter than 5 km the chlorophyll spectrum exhibits a slope of approximately -1, while temperature and salinity have steeper slopes (-5/3). Power spectra for temperature and salinity steepen at wavelengths greater than 20 km, reflecting the large scale changes in these parameters associated with the transition from estuarine to coastal waters. Chlorophyll-a structure at these wavelengths is related to the distribution of nutrients, especially ammonium. (Harris-Wisconsin)

A DISCRETE MODEL FOR THE STUDY OF A LAKE,
Laboratories d'Automatique, Saint Martin D'Heres (France).
S. Gentil.
Applied Mathematical Modeling, Vol 3, No 3, p 193-198, 1979. 6 Fig, 1 Tab, 11 Ref.

Descriptors: *Lakes, *Simulation analysis, *Computer models, *Eutrophication, Model studies, Mathematical models, Equations, Phytoplankton, Zooplankton, Organic matter, Trophic level, Ecology, Nutrients, Aquatic environment, Predation, Epilimnion, Cycling nutrients, Computer programs.

An original discrete lake model focuses on cultural eutrophication (mineral and organic inputs) effects on a lake epilimnion, especially phytoplankton. The model is based on prey-predation formulation and material balances. State variables include algae, herbivorous zooplankton, organic materials, mineral materials, and nutrients. It takes into account environmental biological capacity and the mineralization process. The system consists of several feedback interconnected loops: it is a multivariable, nonlinear, stationary system. The overall program is composed of 76 statements. Model behavior is tested through various simulations which study the influence of certain parameters and pollution input modification. Pure delay in zooplankton reproduction is introduced. (Danovich-Wisconsin)

MEASUREMENTS OF MINERALIZATION OF PHYTOPLANKTON DETRITUS IN AN OLIGOTROPHIC LAKE,
Cornell Univ., Ithaca, NY. Section of Ecology and Systematics.
J. J. Cole, and G. E. Likens.
Limnology and Oceanography, Vol 24, No 3, p 541-547, 1979. 4 Fig, 1 Tab, 32 Ref.

Descriptors: *Oligotrophy, *Phytoplankton, *Bacteria, *Degradation(Decomposition), *Microbial degradation, *Mirror Lake(NH), Detritus, Microorganisms, Respiration, Tracers, On-site tests, On-site investigations, Analytical techniques, Carbon, Size, Biochemistry, Particle size, Enzymes, Microbiology, New Hampshire, Measurement.

Phytoplankton mineralization, or decomposition, in Mirror Lake, a small oligotrophic lake in New Hampshire, is largely due to bacterial activity. Mineralization activity is the process which produces (C-14)CO2 from C-14 labeled phytoplankton substrate, particulate and dissolved. Incubation bottle and (C-14)CO2 trapping system design provides a method for measuring mineralization rates in microbial communities under in situ temperatures and dissolved gas concentrations without extreme experimental manipulations. From 3-9% of the carbon photoassimilated in 72 h in oligotrophic Mirror Lake is returned to the inorganic carbon pool over an equal period by a mineralization agent in the water column. At least 25%-30% of the particulate phytoplankton detritus is mineralized to CO2 over 500 h. Differential filtration studies indicate the mineralization agents are quite small. 95% of unfiltered activity passed 0.4 micro m Nuclepore filters while only 16% passed 0.45 micro m Millipore filters; many small bacteria are actually trapped inside cellulose-acetate Millipore filters. Since 86% of the unfiltered mineralization activity does not pass 0.1 micro m Sartorius filters, the bulk of the mineralization activity stems from microorganisms (particulate) rather than soluble enzymes (dissolved material). Mineralization activity correlates with very small particles, is inhibited by penicillin-chloraphenicol, and is completely destroyed by heat (121C) or Formalin. Such an agent is presumably bacterial. Descriptors: *Amazon River, *Lago Janaûaca, Brazil, *Water levels, *Floods, *Nutrients, Lakes, Water storage, Rainfall, Seasonal, Flood plains, Flood discharge, Chlorophyta, Algae, Cyanophyta, Growth rates, Productivity, Primary productivity, Runoff, River flow, Phytoplankton, Mixing, Chlorophyll, Ammonia.

During the rainy season, Amazon River water levels rise 10 m, flooding a broad band at least 50 km away and significantly affecting phytoplankton growth in adjacent lakes. The lakes function as a capacitor within the river system and during storage major changes in water chemistry occur due to intense biological activity. Lago Janauaca is a large shallow lake connecting with Rio Solimoes (Amazon River above Rio Negro junction) by a channel 12 km long. The lake is productive (2.2 g C/sq m d), although low in nutrients (0.10 micro g-at nitrate/l, 0.14 micro g-at phosphates /l), and contains large phytoplankton concentrations (52 micro g/chl/l). About 70% of phytoplankton cell volume is accounted for by two green algae, Arthrodesmus and Ankistrodesmus, and blue-green Calothrix. In the nutrient-rich Rio Solimoes (12 micro g-at nitrates/l, 0.90 micro g-at phosphates/l), primary productivity is low (0.063 g C/sq m d) due to poor light penetration caused by turbidity. At the start of the rainy season in December 1976, the rising Amazon began its annual incursion into Lago Janauaca. During the first month, water levels rose 1.5 m. Horizontal variations in lake transparency and nutrient concentrations indicated river water penetration. In the mixing zone, nearly 75% of the phytoplankton was composed of blue-green algae such as Anabaena, Oscillatoria, and Anacystis. Nitrate and phosphate removal was virtually complete in this zone. Ammonia concentrations peaked, lagging just behind chlorophyll peaks. (Danovich-Wisconsin)

A COMPARISON BETWEEN THE CELL DIVISION RATE OF NATURAL POPULATIONS OF THE MARINE DIATOM SKELETONEMA COSTATUM (GREVILLE) CLEVE GROWN IN DIALYSIS CULTURE AND THAT PREDICTED FROM A MATHEMATICAL MODEL,
Skidaway Inst. of Oceanography, Savannah, GA.
J. A. Yoder.
Limnology and Oceanography, Vol 24, No 1, p 97-106, 1979. 5 Fig, 3 Tab, 29 Ref. NSF GA 31391.

Descriptors: *Dialysis, *Diatoms, *Cultures, *Mathematical models, *Growth rates, Regression analysis, Cytological studies, Narragansett Bay(RI), Marine algae, Phytoplankton, Population, Sea water, Temperature, Water temperature, Light intensity, Silicates, Nutrients, Ecosystems, Equations, On-site investigations, Forecasting, Rhode Island, Skeletonema costatum.

During the 1977 winter-spring phytoplankton bloom in Narragansett Bay, Rhode Island, cell division rates of natural Skeletonema costatum populations encapsulated in dialysis bags and exposed to bay water could be predicted from equations primarily formulated from batch culture studies of a single S. costatum clone. Equations incorporating only temperature and light intensity effects explain cell division rates; these parameters account for 90% of the observed variation. However, predictions based solely on temperature levels and light intensity tend to overestimate observed division rates. When an expression incorporating the combined effect of silicate concentration, light intensity and temperature on cell division rate is used, the relationship gives better results. Terms not included in the model are light acclimation, temperature-dependence of K-s, and short changes in bay water nutrient concentrations such as dissolved inorganic nitrogen and phosphorus. Results tend to support the validity of an autecologival approach to studying marine phytoplankton dynamics. At weekly intervals January-May 1977, during the winter-spring bloom, phytoplankton samples were collected from Narragansett Bay, encapsuled in dialysis bags, incubated in flowing seawater for 2-5 days at two different light levels, and S. costatum cell division rate was determined. FUNCTIONALLY DISTINCT CLASSES OF COMPLEX PHOSPHORUS COMPOUNDS IN LAKE WATER,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
D. A. Francko, and R. T. Heath.
Limnology and Oceanography, Vol 24, No 3, p 463-473. 1979. 5 Fig, 1 Tab, 35 Ref, EPA 10160-HCS-R801936.

Descriptors: *Orthophosphate, *Chromatography, *Twin Lakes(OH), *Crazy Eddie Bog(OH), *Phosphorus compounds, Eutrophication, Phosphorus, Lakes, Light, Light intensity, Phosphates, Phytoplankton, Nutrients, Cycling nutrients, Chemical reactions, Water chemistry, Water, Bogs, Fractionation, Ultraviolet radiation, Anion exchange, Enzymes, Ohio.

Chromatographic results from two eutrophic lakes, East and West Twin Lakes, and a humic bog, Crazy Eddie Bog, in northeastern Ohio suggest that phosphate is released from complex phosphorus compounds and made available to planktonic organisms by two distinct modes. One release mode is dependent on phosphatase activity and independent of incident light intensity. The other functional compound class, those insensitive to phosphatase activity, release orthophosphate simultaneously on exposure to sufficient doses of sunlight. Classes are mutually exclusive and account for all the filtrable complex phosphorus compounds in the lakes. The lakes contain numerous low molecular weight compounds which are resistant to low-dose ultraviolet (UV) irradiation but readily release orthophosphate upon treatment with alkaline phosphatase. Humic bog filtrable phosphorus compounds are predominately high

molecular weight, cochromatograph with yellow acids in each fractionation procedure, and resist enzyme hydrolysis but release orthophosphate upon irradiation with low UV light doses. The UV phosphorus bound to material sensitive to UV light was released as othrophosphate within 3 h, suggesting the phosphate release by sunlight is important in phosphorus dynamics in systems predominated by UV-sensitive compounds. Filtrable phosphorus compounds were fractionated by anion-exchange and gel-filtration chromatography. (Danovich-Wisconsin)

FIREFLY ASSAY OF ADENINE NUCLEOTIDES FORM ALGAE: COMPARISON OF EXTRACTION METHODS,
Stockholm Univ., Sweden. Inst. of Botany.
C. M. Larsson, and T. Olsson.
Plant and Cell Physiology, Vol 20, No 1, p 145-155. 1979. 1 Fig, 4 Tab, 38 Ref.

Descriptors: *Algae, *Adenine nucleotides, *Analytical techniques, *Evaluation, Biochemistry, Cytological studies, Assay, Firefly luciferase, Laboratory tests, Plant physiology, Energy, Methodology, Testing procedures, Metabolism, Light, Darkness, Measurement, Buffering.

Six different methods for extraction of adenine nucleotides from algae were evaluated: Tris-buffer, ethanol, chloroform, sulfuric acid, trichloroacetic acid (TCA), and perchloric acid (PCA). With sampling times in the order of seconds, extraction in-situ with TCA or PCA gives the highest total extraction in combination with highest ATP proportions, that is, high energy charges and ATP/ADP ratios. High (ATP+ADP+AMP) yields indicate complete release of adenine nucleotides from algae. Methods resulting in high energy charges give lower variabilities of ATP determinations than other methods indicating fast inactivation of adenine nucleotide metabolism. Methods resulting in high energy charges also give better time resolution in dark-light transitions than other methods. Extraction of illuminated algae in-situ with the different methods results in great variations between ATP, ADP, and AMP proportions while adenine nucleotide sum varies less. Tris-extraction performed by sample withdrawal is much more efficient than when performed in-situ due to high initial concentration and extraction medium temperature. Experimental organisms were Anacystis nidulans, Euglena gracilis, Chlorella kessleri and Scenedesmus obtusiusculus. Adenine nucleotides were determined by firefly luciferase assay. (Danovich-Wisconsin)

SEASONAL CHANGES IN THE STANDING CROP OF AN EPILITHIC ALGAL POPULATION ON THE NORTH SHORE OF GREAT SLAVE LAKE,
Canada Environmental Service, Yellowknife (Northwest Territories).
J. W. Moore.
Canadian Journal of Botany, Vol 57, No 1, p 17-22, 1979. 2 Fig, 3 Tab, 31 Ref.

Descriptors: *Algae, *Standing crops, *Great Slave Lake, Canada, *Seasonal, Population, Density, Epilimnion, Diatoms, Ecological distribution, Chrysophyta, Chlorophyta, Cyanophyta, Euglena, Aquatic microorganisms, Speciation, Nutrients, Alkalinity, Distribution.

Epilithic algal populations on the north shore of Great Slave Lake, Canada, studied June 1975-November 1976, increase rapidly in May immediately after disappearance of ice, show only small fluctuations during the summer and wane during October. Great Slave Lake is the second largest lake in northern Canada with 28,800 sq km total area. It has 450 km maximum length and 600 m maximum depth. Rocks on the north shore are covered with large Ulothrix zonata (Chlorophyta) growths. A total of 187 microscopic algal species were recorded: 142 Bacillariophyta, 28 Chlorophyta, 10 Cyanophyta, and seven others. Predominant diatom species are Gomphonema olivaceum, G. ventricosa, Fragilaris capucina, and Cymbella ventricosa. The most commonspecies are Oscillatoria limosa, Dinobyron bavaricum, and Euglean. Microsopic algal density reaches peak abundance (2 billion cu micro m/sq cm) irregularly throughout the growing season. However, filamentous algae, mainly Ulothrix zonata, reaches maximum densities (60 mg/sq cm dwt) during July. Common epilithic algae in the east arm of the lake include Tabellaria flocculosa, Rhopalodia gibba, Cymbella angustata, C. microcephala, Anomoeneis vitrea, Achnanthes minutissima, and Ulothrix zonata. Algal densities are considerably less than those on the north shore due to lower nutrient and higher alkalinity levels. Maximum abundance for microsopic and filamentous algae are 1.05 billion cu micro m/sq cm and 4.1 mg/sq cm, respectively. (Danovich-Wisconsin)

EFFECT OF GROWTH IRRADIANCE ON THE MAXIMUM PHOTOSYNTHETIC CAPACITY OF WATER HYACINTH (EICHHORNIA CRASSIPES (MART.) SOLMS),
Southern Weed Science Lab., Stoneville, MS.
D. T. Patterson, and S. O. Duke.
Plant and Cell Physiology, Vol 20, No 1, p 177-184, 1979. 4 Tab, 25 Ref.

Descriptors: *Water hyacinth, *Light intensity, *Photosynthesis, *Adaptation, *Irradiance, *Plant physiology, Oxygen, Light, Laboratory tests, Stomata, Resistance, Leaves, Chlorophyll, Proteins, Statistics, Growth rates, Plant growth, Transpiration, Age.

In laboratory experiments water hyacinth adapts photosynthetically to high irradiance; this adaptation is limited to expanding leaves and younger leaves. Both short- and long-term high irradiance effects on photosynthetic capacity are manifested through increases in mesophyll conductance, soluble protein content and specific leaf weight. Maximum photosynthetic rates and low oxygen enhancement effects indicate that the water hyacinth possesses the C3 photosynthesis pathway. Increased irradiance during growth results in greater light-saturated photosynthetic rates. In air containing 21% oxygen maximum photosynthetic rates are 14, 29, and 34 mg CO_2/sq dm h for plants grown in artificial light at 90 and 750 micro E/sq m sec and full sunlight, respectively. Photosynthetic rates in 1% oxygen are 50% greater than rates in normal air indicating photorespiration. Variations in mesophyll conductance could account for 91% of the variations in light-saturated photosynthetic rates. Variations in protein content or specific leaf weight could account for 75% of the variation in photosynthetic rate. Stomatal and mesophyll conductances in old leaves are unaffected by transfer from low to high irradiance. However, in young expanding leaves, stomatal conductance significantly decreases by transfer while mesophyll conductance significantly increases. (Danovich-Wisconsin)

ATP AS A MEASURE OF LIVING PHYTOPLANKTON CARBON IN ESTUARIES,
Quebec Univ., Rimouski. Dept. of Oceanography.
M. Sinclair, E. Keighan, and J. Jones.
Journal of the Fisheries Research Board of Canada, Vol 36, No 2, p 180-186. 1979. 5 Fig, 1 Tab, 29 Ref.

Descriptors: *Phytoplankton, *Carbon, *St. Lawrence Estuary, *Analytical techniques, *ATP, Biomass, Estuaries, Measurement, Chlorophyll, Cytological studies, Regression analysis, Heterotrophy, Spatial distribution, Bacteria, Evaluation, Plankton, Microorganisms.

Comparisons are made between living phytoplankton carbon (C) estimated by ATP and cell volume transformation methods on phytoplankton in the Lower St. Lawrence Estuary. In high biomass samples, greater than 10 micro g C/l by cell volume transformation, both methods agree. In low biomass samples, the cell volume transformation method seriously underestimates C relative to the ATP methods. ATP estimates may be high due to contamination by animal and bacterial ATP. In 14 of 18 samples, estimated microzooplankton contamination is 3% of ATP-derived C and in one sample 19%. ATP accuracy as a measure of living phytoplankton C in general is debatable, but in estuaries in which nutrient limitation is negligible, it is a moderately accurate estimate when phytoplankton biomass is medium to high (1 micro g chlorophyll a/l). In the Lower St. Lawrence, unless exceptionally high bacterial biomass is present, heterotorphic contamination is not large. Considerable variability with depth and time is observed in the estimated carbon/chlorophyll-a ratio, especially during high biomass when ATP-derived phytoplankton C is reliable. The variable ratio suggests the inapplicability of using a constant ratio for estimating C from chlorophyll a, or of using chlorophyll regression analysis on particulate C to estimate the carbon/chlorophyll a ratio, in this environment. NOTES ON THE PHYTOPLANKTON PERIODICITY OF ROSTHERNE MERE, CHESHIRE, 1967-1977,
Freshwater Biological Association, Ambleside (England).
C. S. Reynolds.
British Phycological Journal, Vol 13, No 4, p 329-335, 1978. 1 Fig, 1 Tab, 15 Ref.

Descriptors: *Rostherne Mere, *Phytoplankton, *Succession, *Algae, Dominant organisms, Sediments, Sampling, Microcystis aeruginosa, Ceratium, Diatoms, Cryptophyta, Anabaena, Life history studies, England.

Sedimentary samples of 0-4.5 columns were collected intermittently 1967-1977 from Rostherne Mere, one of the largest and deepest lakes of the Shropshire-Cheshire Plain in England. Seasonal phytoplankton succession and interactions between the two dominant algae, Microcystis and Ceratium, were studied. Microcystis aeruginosa was overwhelmingly dominant for five summers; Ceratium dominated in two of the remaining years; diatoms and Anabaena spp. were the most dominant in the other year. Algal biomass was generally low during the first half of the year. Periodicity of Microcystis aeruginosa has been shown as closely related to the annual cycle of stagnation and destratification, while the high nutrient status of the water and the ability of vegetative colonies to descend and over-winter on the bottom muds are factors contributing to its successful growth in the lake. In 1971 and 1975 Ceratium not only replaced Microcystis but growth culminated in crops comparable to the largest ones of Microcystis. The maxima of these algae in seven years were reciprocal though not necessarily inversely correlated. Ceratium is able to succeed if the earlier and potentially more rapid growth of Microcystis is inhibited for any reason, including nutrient limitation or parasitic attack. When neither Microcystis nor Ceratium are abundant, the summer phytoplankton is dominated by diatoms and Anabaena. The interludes of Ceratium dominance are potentially useful for sediment stratigraphy interpretations. (Harris-Wisconsin)

BIOSYNTHESIS AND RELEASE OF ORGANOARSENIC COMPOUNDS BY MARINE ALGAE,
Scripps Institution of Oceanography, La Jolla, CA.
M. O. Andreae, and D. Klumpp.
Environmental Science and Technology, Vol 13, No 6, p 738-741, 1979. 3 Fig, 3 Tab, 9 Ref.

Descriptors: *Biochemistry, *Marine algae, *Arsenic compounds, *Kinetics, *Metabolism, Arsenic radioisotopes, Nutrients, Organic compounds, Algae, Cytological studies, Coccolithopore, Phosphates, Analytical techniques, Bioaccumulation, Phytoplankton, Plant physiology, Cultures, Tracers.

Arsenate uptake from seawater, organoarsenic compound biosysthesis, and release of arsenite, methyl arsonate, and dimethyl arsinate were studied in pure marine phytoplankton cultures. Marine phytoplankton actively take up arsenate at natural concentrations from its environment and regulate

cellular arsenic levels independently of phosphate concentrations over large concentration ranges. Significant differences exist between algal species, both in terms of uptake rates and type and number of compounds produced. In addition to substantial arsenic amounts strongly bound to cell structural parts, up to 12 soluble organoarsenic compounds were formed. A five day arsenate uptake experiment using Platymonas cultures and As-74 as a radioactive tracer shows that cellular arsenic content increases during the first two days, then stabilizes while arsenic in the medium drops 35% from 13 nM and phosphate falls from 19 to 0.7 micro M. Large variations in phosphate concentrations does not significantly influence cellular arsenic concentrations. Biosynthetic studies were conducted on Skeletonema costatum, Platymonas suecica, Gonyaulux polyedra, and Cricosphaera carteri. With the exception of Crisocosphaera, all cultures incorporated significant amounts of arsenic (13-78%). All species released substantial amounts of methyl arsonate and dimethyl arsinate into their environment. (Danovich-Wisconsin)

EFFECTS OF NUTRIENTS AND TEMPERATURE ON DECOMPOSITION OF MYRIOPHYLLUM SPICATUM L. IN A HARD-WATER EUTROPHIC LAKE,
Wisconsin Univ.-Madison. Dept. of Botany.
S. R. Carpenter, and M. S. Adams.
Limnology and Oceanography, Vol 24, No 3, p 520-528, 1979. 3 Fig, 2 Tab, 40 Ref, NSF DEB-75-19777.

Descriptors: *Nutrients, *Temperature, *Lake Wingra(WI), *Decomposing organic matter, *Degradation(Decomposition), *Myriophyllum spicatum, Nitrogen, Phosphorus, Environmental effects, Macrophytes, Laboratory tests, Mathematical models, Eutrophication, Deterioration, Detritus, Plant physiology, Aging(Physical), On-site investigations, Forecasting, Water temperature, Equations, Wisconsin.

Laboratory decay rate predictions of Myriophyllum spicatum shoots explain Lake Wingra, Wisconsin, field variance well, but systematically underestimates field decay rates. Temperature, phosphorus, and nitrogen effects on shoot decay were examined in the laboratory. Equations developed from laboratory data predicted decay in Lake Wingra; predictions were then tested against litter bag data. Nitrogen enrichment significantly increases the decay coefficient while phosphorus enrichment does not. Tissue nitrogen and nitrate enrichment both significantly influence the decay coefficient. In laboratory experiments, phosphorus is lost from tissues during decay, corroborating with absence of phosphorus limitation. In contrast, little nitrogen is liberated. Over condition ranges examined, nitrogen saturation of decay rates does not occur. Therefore, laboratory and field data show that nitrogen content linearly corresponds to decay rates. Decay coefficients increase with increasing temperature to 28C and then decline. Water temperature and initial tissue nitrogen content are useful factors for predicting M. spicatum decay rates in Lake Wingra. Predictions and observations are similar at low decay rates, but at high decay rates, predictions are only 60% of observed values. Inaccuracy is explained by important biological differences including more rapid nitrogen accumulation by detritus decaying in the lake, probably due to greater nitrogen availability; detritus colonization rates by microbes; and invertebrate activities. EXPRESSING THE PHOSPHORUS LOADING CONCEPT IN PROBABILISTIC TERMS,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
S. C. Chapra, and K. H. Reckhow.
Journal of The Fisheries Research Board of Canada, Vol 36, No 2, p 225-229, February 1979. 4 Fig, 2 Tab, 9 Ref.

Descriptors: *Phosphorus, *Probability, *Nutrient loading, *Vollenweider models, *Reliability, Limnology, Management, Lakes, Eutrophication, Mathematical models, Statistics, Nutrients, Forecasting, Trophic level, Variability, Risks, Water quality, Estimating, Temperate.

Data representing 117 North Temperate Lakes were used to estimate uncertainty of a phosphorus loading model. Graphical representations demonstrate the importance of including probabilistic information in phosphorus loading calculations. Vollenweider's phosphorus loading plots predict a lake's trophic state on the basis of variables representing its phosphorus loading, morphometry, and hydrology. Plots are statistical since they represent generalizations drawn from large numbers of lakes. They are also deterministic in that a fixed predicted value results from any given set of independent variables. Predictions are useful estimates but models do not include information on reliability or prediction uncertainty. This paper quantifies the unexplained variability, or uncertainty of a phosphorus leading model. The procedure has shortcomings: (1) Results are applicable only within the range of conditions represented by the data set. Climatic range is limited to the North Temperate Zone. (2) The model is based on completely mixed lake conditions: it predicts the average phosphorus concentration in a lake and does not predict temporal or spatial deviations. (3) Errors exist in model variable estimates, particularly phosphorus inflow concentration. (4) While phosphorus enrichment assumes eutrophication, other parameters (chlorophyll-a, Secchi depth, dissolved oxygen) provide a more realistic basis for analyzing uncertainty of lake trophic state calculations. AMMONIA VOLATILIZATION OF WINTER SPREAD MANURE,
Cornell Univ., Ithaca, NY. Dept. of Agricultural Engineering.
T. S. Steenhuis, G. D. Bubenzer, and J. C. Converse.
Transactions of the American Society of Agricultural Engineers, Vol 22, No 1, p 152-161, 1979. 6 Fig, 5 Tab, 23 Ref.

Descriptors: *Manure, *Volatility, *Ammonia, *Winter, Regression analysis, Evaporation, Physical properties, Nitrogen, Drying, Freeze-thaw tests, Dehydration, Temperature, Winds, Ureas, Nitrogen compounds, Fertilizers, Equations, Laboratory tests, On-site tests, Surface runoff, Seasonal.

Winter manure spreading reduces ammonia volatilization because wind speeds and temperature are normally lower and a large amount of manurial nitrogen is in the urea form. This paper determines parameters affecting ammonia volatilization from winter manure spreading and develops an equation to predict the effect of manure loading and environmental factors such as wind speed and temperature on volatilization. Doubling wind velocity results in halving the ammonia volatilization half life. Spreading manure during low air turbulence periods and incorporating it into the soil as soon as possible leads to minimum volatilization bases. Urea conversion to ammonia limits ammonia volatilization following winter spreading. Relative air humidity has no appreciable effect on volatilization. Drying is not required for volatilization. Higher application rates increase volatilization half-life. Freezing and thawing does not increase volatilization. On 22 January 1976, a manure spreading field experiment began. Half-life for volatilized ammonia was 11 days assuming 30% of ammonia infiltrated into the soil shortly after spreading. Temperatures during the 14 day experiment varied +10C to -28C with -2C average. When surface runoff occurs due to winter thaw, melt water may contain large amounts of unvolatilized nitrogen. NUTRIENT BUDGETS OF A TEMPORARY POND ECOSYSTEM,
New York State Coll. of Agriculture and Life Sciences, Ithaca. Ecology and Systematics Section.
J. J. Cole, and S. G. Fisher.
Hydrobiologia, Vol 63, No 3, p 213-222, 1979. 3 Fig, 6 Tab, 26 Ref.

Descriptors: *Lost Pond(MA), *Ecosystems, *Energy budget, *Cycling nutrients, *Nutrient budgets, Nutrients, Kinetics, Carbon, Shallow water, Ponds, Temporary pond stage, Nutrient transport, Seasonal, Organic matter, Organic loading, Rainfall, Primary productivity, Respiration, Seepage, Massachusetts.

Input-output budgets of organic carbon and several inorganic nutrients in temporary Lost Pond, central Massachusetts, 1974-1975 suggest that during summer months, small ponds are open systems with respect to nutrients yet closed energetically. At full spring volume, Lost Pond has 3500 sq m surface area, 73 cm mean depth, and 2700 cu m volume. The pond's watershed is 8.3 ha of uninhabited forest. Water enters the pond primarily by subsurface seepage. Typically the pond dries over the summer and fills again in late October. In December about one-third of the pond water is ice. Dissolved organic matter is lowest (3-4 mg/l) in winter and early spring and increases dramatically to a maximum value of 45 mg/l in summer dry periods. Based on the assumption that sodium inputs are balanced by exports, nutrient budgets indicate that (1) Calcium, magnesium and chloride inputs are balanced by exports and flow through the system. (2) Nitrate, phosphate and sulfate are all retained during both summers indicating nutrients may be converted to some other form by the system. (3) Dissolved organic matter is released by the system indicating the presence of an internal source. (4) Potassium is either retained or released. During summer, rainfall accounts for 21-41% of the hydrologic input. Macrophyte primary production is the major organic carbon input and heterotrophic community respiration is responsible for 84% of the organic carbon output. (Danovich-Wisconsin)

RELATIONSHIP BETWEEN PRODUCTIVITY AND N2 (C2H2) FIXATION IN A THALASSIA TESTUDINUM COMMUNITY,
State Univ. of New York at Stony Brook. Marine Science Research Center.
D. G. Capone, P. A. Penhale, R. S. Oremland, and B. F. Taylor.
Limnology and Oceanography, Vol 24, No 1, p 117-125, 1979. 3 Fig, 9 Tab, 36 Ref. NSF OCE 74-01986, OFF 72-02716 AT-40-1-4493.

Descriptors: *Nitrogen fixation, *Primary production, *Bimini Harbor, Bahamas, *Thalassia, Productivity, Tidal waters, Plant groupings, Metabolism, Growth rates, Methodology, Analytical techniques, Leaves, Epiphytes, Plant populations, Plant physiology, Standing crop, Plant tissues, Plant growth, Rhizomes, Rhizosphere, Biological communities, Carbon, Bahamas.

July 1976 investigations of Thalassia testidium beds in Bimini Harbor (Bahamas) concludes that nitrogen (N) fixation directly relates to productivity, providing good support for Patriquin's hypothesis. Data also suggest independence of macrophyte and its leaf epiphytes with respect to N metabolism. Standing stocks of Thalassia leaves plus epiphytes were 200 g dwt/sq m. Production assessed by the C-14 method considerably exceeds that determined by methods of Zieman and Patriquin. The latter methods determine production by leaf growth measurements and by applying an empirical formula based on leaf dimensions. Production differences are due to photosynthate utilization in other processes such as rhizome production, plant respiration and microbial N fixation in the rhizosphere. Sediment fixation constitutes the bulk of the total N fixed. N fixation in the rhizosphere provides either 12-22% (C-14 method) or 21-48% (Zieman technique) of the N required for leaf production. Rhizome growth N requirements are small due to high carbohydrate tissue contents. N fixed in the rhizosphere contribute predominately to macrophyte production, whereas phyllosphere N fixation primarily promotes leaf epiphyte development. N fixation significantly correlates with C02 fixation rates when all community components are considered. N fixation is important to production in Thalassia communities and the plant and its leaf epi-

phytes may be distinct entities in terms of N and carbon metabolism. (Danovich-Wisconsin)

BIOLOGICAL AND WATER QUALITY EFFECTS OF ARTIFICIAL MIXING OF ARBUCKLE LAKE, OKLAHOMA, DURING 1977,
Oklahoma State Univ., Stillwater. School of Biological Sciences.
D. W. Toetz.
Hydrobiologia, Vol 63, No 3, p 255-262, 1979. 6 Fig, 6 Tab, 21 Ref. OWRT A-068-OKLA(2).

Descriptors: *Water chemistry, *Water quality, *Arbuckle Lake(OK), *Algae, *Mixing, *Destratification, Water circulation, Biomass, Chlorophyll, Lake restoration, Lakes, Water quality control, Respiration, Ammonia, Biochemical oxygen demand, Chemical properties, Ecosystems, Dissolved oxygen, Thermocline, Epilimnion, Hypolimnion, Environmental effects, Secchi disks, Primary productivity, Oklahoma.

Artificial mixing decreased the ratio gross production: community respiration below unity in Arbuckle Lake, Oklahoma, 1977 and the lake ecosystem became more heterotrophic, suggesting that lakes which are not artificially mixed have lower net primary productivities than lakes which are not artificially mixed. This paper describes the effects of total lake mixing with 16 axial flow pumps, on Arbuckle Lake water quality, algal biomass, and community metabolism. Pumping began on 1 July 1977. Mechanical pumping significantly lowered the thermocline from 9-15 m and delivered dissolved oxygen to depths normally anoxic. Pumping effects on other water quality parameters are less clear, however. Epilimnion water quality was basically the same in 1976-1977. Concentrations of S and Mn were below detection in both years and BOD was unchanged. Only NH3 concentration were lower in 1977. Hypolimnion water quality generally improved during 1977 when the lake was mixed. Mean NH3 and BOD concentrations decreased; Mn was unchanged but S concentrations increased. Algal biomass as chlorophyll a was about the same in 1977 as in 1976 (9 micro g/l). Secchi disc depth was also the same. Mean lake transparency ranged from 1.60-1.98 m in 1976 and from 1.62-1.88 m in 1977. Algal blooms did not occur either year. (Danovich-Wisconsin)

POPULATION DYNAMICS AND AGE STRUCTURE OF BOSMINA LONGIROSTRIS IN AN ACID WATER IMPOUNDMENT,
West Virginia Univ., Morgantown. Dept. of Biology.
J. DeCosta, and A. Janicki.
In: Proceedings: Congress in Denmark 1977, Internationale Vereinigung fur Theoretische und Angewandte Limnologie; Vol 20, Part 4, p 2479-2483, 1978. 3 Fig, 1 Tab, 6 Ref. A-024-WVA(2).

Descriptors: *Population, *Dominant organisms, *Crustaceans, *Acidic waters, *Cheat Lake(WV), Age, Growth rates, Growth stages, Zooplankton, Weight, Bosmina longirostris, Copepods, Biological communities, Acidity, Acid mine water, Impoundments, Biomass, Seasonal, Backwater, Dams, Size, Predation, Competition, Reproduction.

This paper examines seasonal succession of biomass and age structure of Bosmina longirostris populations in acid Cheat Lake, West Virginia and Pennsylvania, and in two less-acidic embayments, May-November 1974. Median surface pH is 4.6 for Cheat Lake and 6.0 in its backwaters. Acid conditions in Cheat Lake are due to mine drainage; data show simple zooplankton communities due to acidification. Extreme Bosmina dominance in the lake suggests that Bosmina has a competitive advantage under more acid conditions. This advantage may be due to high feeding efficiency on a reduced size range of food particles. Lack of Bosmina early dominance in backwaters results from Mesocyclops edax predation. Bosmina becomes increasingly dominant from midsummer to fall especially in lake stations but less so in the two backwaters. Cyclopoids dominates early in the season at lake stations but by September, Bosmina biomass peaks, at nearly 100% Crustacea less nauplii. Biomass dynamics are different at backwater stations. In one area, highest Bosmina biomass occurs in August. However, Bosmina backwater dominance is not so striking due to the presence of M. edax. Early in the growing season, lake populations are composed primarily of large individuals; however, as reproduction rates increase, mean individual weight decreases due to large numbers of smaller individuals. At all lake stations, this low mean weight characterizes the entire summer. However, the population is composed of large individuals by October-November because reproduction rates decrease in autumn. (Danovich-Wisconsin)

PLANKTONIC SYSTEMS AND URBAN POLLUTION: STUDY OF PLANKTON POPULATIONS, (IN FRENCH).
Centre Universitaire de Luminy, Marseille (France). Lab. d'Hydrobiologie Marine.
Oceanologica Acta, Vol 2, No 4, p 379-388, 1979. 35 Fig, 1 Tab, 15 Ref, (English abstract).

Descriptors: *Plankton, *Toxicity, *Sewage effluents, Phytoplankton, Zooplankton, Biological communities, Dominant organisms, Copepods, Outfall sewers, Coasts, Aquatic populations, Bioindicators, Mediterranean Sea, Marseille(France).

This paper describes a study of the distribution of plankton populations in terms of their location with regard to the sewage outfall and of depth. A comparison is made between superficial and underlying populations. In the surface layer, zooplankton density is minimal in the immediate vicinity of the outfall, and increases towards the periphery of the surrounding basin. In the deep layer, the influence of pollution is less pronounced, and neritic zooplankton reaches the shoreline even in the most affected area. With a light wind blowing from the East, three zones may be distinguished. The first of these which is characterized by pronounced turbidity and by high concentrations of carbon, extends to a distance of some 500m from the shoreline, and for more than a kilometer in the immediate vicinity of the outfall; very tolerant zooplankton (Oithona helgolandica, Acartia clausi, Clausocalanus sp., Paracalanus parvus, Oikopleura sp.) and phytoplankton species (Leptocylindus danicus, Nitzschia delicatissima, Rhizosolenia fragilissima) may be observed in this zone. In the second, transitional zone, which is adjacent to the first species found in the most polluted area are more abundant together with others which are more sensitive to pollution (such as the copepods of the family Corycaeidae, Centropage typicus, Temora stylifera etc.). The third, peripheral zone contains the above-mentioned as well as species which are entirely absent in polluted areas and in deep water; the latter include copepods of the Pontellidae family, whose hyponeustonic behaviour is extremely sensitive to pollution, and whose presence would thus suggest that the influence of pollution is insignificant in this zone. EFFECTS OF DISPERSANT USE ON SHORE LIFE,
University Coll. of Swansea (Wales).
A. Nelson-Smith.
In: Chemical Dispersants for the Control of Oil Spills, ASTM STP 659, L. T. McCarthy, Jr., G. P. Lindblom and H. F. Walter, Eds., American Society for Testing and Materials, p 253-265, 1978. 45 Ref.

Descriptors: *Toxicity, *Bioassay, *Oil spills, Oil, Organic compounds, Environmental effects, Aquatic life, Shores, Coasts, Waterbirds, Beaches, Worms, Mollusks, Crustaceans, Plankton, Marine algae, Water pollution control, *Oil dispersants, *Dispersants, Torrey Canyon Spill, England, Milford Haven.

Damage to Cornish seashore life resulting from the chemical dispersal of oil spilled from Torrey Canyon is often taken as typical of dispersant use, although primitive mixtures were badly misapplied there. Where more modern dispersants are used with care, as in recent Milford Haven spills, serious consequences can be avoided. All effective dispersants offer some biological hazards, especially to sedentary or planktonic filter-feeding animals, which are not revealed by short-term acute toxicity testing. Spilled oil should therefore be removed mechanically wherever possible. Careful spraying is recommended to prevent an oil slick reaching the shore and to protect seabird colonies. It may also be necessary on rocky or built-up amenity areas but should be avoided on coasts rarely visited by humans and distant from bird colonies. Spraying may worsen matters on sandy shores, while any form of treatment will further damage oiled salt marshes. (Deal-EIS)

IMPACTS OF THERMAL ADDITION AND PREDATION ON INTERTIDAL POPULATIONS OF THE BLUE MUSSEL, MYTILUS EDULIS L.,
Maine Univ., Walpole. Ira C. Darling Center for Research, Teaching and Service.
D. Dean.
Proceedings of the National Shellfisheries Association, Vol 69, p 47-53, 1979. 3 Fig, 2 Tab, 27 Ref.

Descriptors: *Mussels, *Mortality, *Heated water, Nuclear powerplants, Cooling waters, Fouling, Entrainment, Thermal effluents, Aquatic populations, Dominant organisms, Crabs, Habitats, Water temperature, Predation, Monitoring.

Populations of the blue mussel, Mytilus edulis, were sampled at four locations on nearly vertical intertidal rocky surfaces from 1970 to 1977. One sampling station was adjacent to the thermal discharge weir of the Maine Yankee Atomic Power Co. electric generating plant, and the other stations were located at increasingly greater distances from the plant. Those mussels adjacent to the weir suffered 100% mortality in less than one year after the plant began operation, and recruitment was not observed even though the means of discharge was changed to a diffuser system during the summer of 1975. Mussel populations at the other three stations declined from several thousand per square meter in 1970 to zero in 1977 although mussels continued to pose a fouling problem within the Maine Yankee plant and on nearby floats. Examination of records of organisms impinged upon the traveling screens of the Maine Yankee plant intake structure revealed a dramatic increase in green crabs, Carcinus maenas, concurrent with the decline of intertidal mussels. During the fall of 1977, an extensive qualitative examination of the rocky intertidal zone revealed that green crabs of many different sizes were very abundant and that mussels were extremely scarce. Floating docks a few meters away were festooned with mussels of several size groups, including the zero age class. The increase in green crab abundance coincided with an increase in the regional surface sea water annual mean temperature. (Deal-EIS)

CHIRONOMID COMMUNITIES AS WATER QUALITY INDICATORS,
Bergen Univ. (Norway). Dept. of Systematics.
O. A. Saether.
Holarctic Ecology, Vol 2, p 65-74, 1979. 3 Fig, 2 Tab, 26 Ref.

Descriptors: *Mathematical models, *Bioindicators, *Diptera, Methodology, Biological communities, Dominant organisms, Trophic level, Eutrophication, Mesotrophy, Oligotrophy, Phosphorus, Chlorophyll, Oligochaetes, Hypolimnion, Aquatic insects, Arctic, Lakes, Dissolved oxygen, Chlorophylla.

Recent mathematical indices summarizing biological communities of indicators are recapitulated. Improvements of these indices based on weighting according to width of trophic ranges of each species are suggested. Their principle deficiencies, however, are pointed out. Revised lists of characteristic profundal as well as littoral and sublittoral chironomids in Nearctic and Palearctic lakes show that at least 15 characteristic Thcironomid species communities can be delineated, 6 in each of the oligotrophic and the eutrophic ranges and 3 in the mesotrophic range. It is proposed that these communities be lettered consecutively in the Greek alphabet from a(alpha) to o(omikron). A key to the 15 divisions based on the species associations in the profundal zone of harmonic lakes is put forward. There is very good correlation between the 15 divisions and the ratios of average total phosphorus to mean lake depth and average chlorophyll a to mean lake depth. The ratio of chironomids to oligochaetes and the distribution patterns of single species have proven useful in pin-pointing localized areas of pollution. The primary mechanism governing the distribution of chironomid communities in oligotrophic and mesotrophic lakes appears to be the availability of food materials rather than the annual hypolimnetic oxygen concentration. In eutrophic lakes the relationships between organic matter accumulation and oxygen levels are so interdependent as to be inseparable. (Deal-EIS)

A. Bakalem, and J-C. Romano.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique de La Mer Mediterranee, Monaco, 24-27 November 1978, Antalya, Turkey, p 335-341, 1979. 7 Tab, 2 Ref, (English abstract).

Descriptors: *Benthos, *Invertebrates, *Water pollution effects, Estuaries, *Domestic wastes, Sewage, Molluscs, Oligochaetes, Diversity index, Algiers, Bay of Algiers, Mediterranean, Seasons.

The dynamics of the benthic populations in the Bay of Algiers has been studied at eleven stations. Preliminary results indicated that the benthic populations are not degraded at the stations close to the effluent pipes. But the influence of the pollution is discernible throughout the bay, especially at depths of less than 20 meters. The changes are most clearly observed during the summer season. Future studies are planned to correlate physical and chemical parameters with the benthic populations. The principal benthic species at the various stations are listed. (Katz-EIS)

Descriptors: *Pesticide toxicity, *Cytological studies, Embryonic growth stage, Mode of action, Bioassay, Growth rates, Marine fish, Animal physiology, Animal metabolism, Bioindicators, *Chlorophos, *Hexachlorane.

A study has been made of the effect of pesticides (chlorophos and hexachlorane) on transplantable human RH kidney cells and initially trypsinized cultures of chick embryo fibroblasts and the gonads of the round goby, Neogobius melanostomus. The threshold concentrations exerting a toxic effect on the cells are determined, and the influence of the toxicants on the growth and proliferation of RH cells and on their mitotic activity is established. Data are presented on the comparative sensitivity of cells of the gonads of sea fishes and of members of the family Gobiidae of chlorophos and hexachlorane. In connection with the fairly high sensitivity of the cells of sea fishes to pesticides consideration is given to the possibility of using cell cultures to determine the permissible threshold concentrations of pesticides in commercially exploited items. THE EFFECT OF HYPOXIA AND ANOXIA ON THE SPECIES AND NUMBERS OF BLACK SEA POLYCHAETA,
Institute of Biology of the Southern Seas, Odessa (USSR).
G. V. Losovskaya.
Hydrobiological Journal, Vol 14, No 4, p 24-26, 1978. 1 Tab, 7 Ref.

Descriptors: *Bioindicators, *Water pollution, Mussels, Dominant organisms, Biological communities, Benthic fauna, Aquatic populations, Water pollution effects, Oxygen requirements, Biomass, Ecosystems, *Polychaetes, *Black Sea, Hypoxia, Anoxia.

An analysis is given of the species and quantitative development of Polychaeta at the time of succession of a Mytilus galloprovincialis biocoenosis due to hypoxia and suffocation of the benthic fauna. Appreciable changes are noted in these indicators, in particular an increase in the abundance of some eurybiontic detritophages among the Polychaeta species after the oxygen deficit and during restoration of the biocoenosis. These are regarded as 'progressive in relation to pollution'. Based on the author's own data and published data a list is given of those organisms whose abundant development may be an indication of organic pollution. (Deal-EIS)

The effect of various conditions on mandibular adductor EMG, a measure of respiration, was stud-

ied. A rapid increase in water temperature (2 degrees in 30 min) resulted in increased motor activity and respiratory frequency. When exposed to phenol, the initial (for 5-10 min) reaction of the grayling was a reduction of motor activity. The duration of the respiratory cycles increased. An increase was subsequently observed in motor activity and respiratory rate. The frequency of coughing movements and the total electrical activity increased considerably. The normal regulation of the mandibular adductor was disrupted. This was expressed in the appearance of non-specific biopotentials in the period of bioelectric silence. When exposure to phenol was of short duration these effects were reversible. (Deal-EIS)

Descriptors: *Toxicity, *Fish reproduction, *Organic compounds, Chemical properties, Mode of action, Fish eggs, Growth stages, Embryonic growth, Stage, Animal pathology, Fertility, *Mutagens, *Teratogens.

In this paper results are presented on the influence of groups of chemical mutagens on the spermatozoa of silver carp and bighead, two commercially important species. The following mutagens were used: nitroso-ethyl urea (NEU); nitrosomethyl urea (NMU); nitrosomethyl-biret (NMB); dimethylsulfate (DMS); and 1,4-bis-diasoacetylbutane (DAB). The exposure of ripe spermatozoa to these chemical mutagens did not negatively influence the process of fertilization. In fact, NEU, NMB and DMS have a stimulating effect on the percentage of egg fertilization in silver carp. However, in the bighead, a sharp increase in the number of aberrant embryos was noted. Silver carp spermatozoa proved more resistant to the mutagenic action of these compounds that those of the bighead. (Deal-EIS)

IMPACT OF THE URBAN EFFLUENT OF CORTIOU ON THE NERITIC PHYTOPLANKTON POPULATIONS (IN FRENCH), GROUPE EQUIPE POLLUTION PELAGIQUE DE MARSEILLE (GROUP EPOPEM).
Centre Universitaire de Luminy, Marseille (France). Lab. d'Hydrobiologie Marine.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 Novembre 1978, Antalya, Turkey, p 371-375, 1979. 3 Fig, 5 Ref. (English abstract).

Descriptors: *Phytoplankton, *Marine algae, *Water pollution effects, Cyanophyta, Euglonophyta, Sewage effluents, Eutrophication, Plant populations, Marseille, Mediterranean, On site investigations, Diatoms.

Two cruises, in spring, and one, in autumn, have been made in Cortiou area (Marseille's sewage outfall). Close to the outfall (about 2 km) the studied area shows photoautotrophic planktonic populations, mainly Cyanophyceae and Euglonophyceae which were abnormal, but afterwards, very quickly, the population system becomes more normal. The very important result is that, even with these particularly eutrophicating conditions, no phytoplankton blooms have been observed. But it could be the consequence of inhibiting action of pollutants contained in the sewage water. (Katz-EIS)

SUB-LETHAL EFFECTS OF THE ORGANOPHOSPHATE BLACK FLY LARVICIDE, ABATE (TEMEPHOS) ON SAROTHERODON MOSSAMBICUS (PETERS),
Centre for Overseas Pest Research, London (England).
R. J. Adeney, and P. Matthiessen.
Journal of Fish Biology, Vol 15, p 545-553, 1979. 5 Tab, 21 Ref.

Descriptors: *Pesticide toxicity, *Cichlids, *Larvicides, Insect control, Fish physiology, Mode of action, Organophosphorus pesticides, Animal metabolism, Chemical properties, Electrolytes, Public health, Human diseases, Vectors(Biological), *Abate, *Temephos, *Tissiue analysis, *Blood chemistry.

Sarotherodon mossambicus was exposed for up to 10 weeks to concentrations of Abate larvicide in excess of those produced during blackfly control in African rivers. Despite this treatment, several indicators of sub-lethal poisoning, e.g. growth, plasma glucose, acetylcholinesterase activity remained almost unchanged. A possible explanation for the low toxicity of Abate may be the fact that AChE inhibition is only caused by the oxygen analogues of Abate and not the parent molecule. (Deal-EIS)

VENTILATION FREQUENCY COMPENSATION RESPONSES OF THREE EURYTHERMAL ESTUARINE FISH EXPOSED TO MODERATE TEMPERATURE INCREASES,
Academy of Natural Sciences of Philadelphia, Benedict, MD. Benedict Estuarine Research Lab.
D. T. Burton.
Journal of Fish Biology, Vol 15, p 589-600, 1979. 6 Fig, 2 Tab, 30 Ref.

Descriptors: *Thermal stress, *Fish behavior, *Respiration, Water temperature, Heat resistance, Heated water, Fish physiology, Statistical analysis, Perches, Chesapeake Bay, Seasonal, *Acclimation, *Spot, *Leiostomus, *Hogchoker, *Trinectes, *Ventilation rates.

Ventilation frequency patterns of Trinectes maculatus, Morone americana and Leiostomus xanthurus were used to evaluate potential thermal stress after exposure to moderate temperature increases. Fish acclimated to 5, 15 and 25C were exposed to a 5C Delta T; fish acclimated to 30C were exposed to a 2.5C Delta T. Ventilation frequencies were measured at each acclimation temperature before the fishes were exposed over a 15-min period to the increased temperatures. Ventilation rates were then measured at the elevated temperatures for the next 24h. Significant increases in rate frequency occurred after the temperature increases in T. maculatus and M. americana acclimated to 5, 15, and 25C and in L. xanthurus acclimated to 15, 25, and 30C. In general, rate frequencies increased as the temperature increased. Ventilation rates stablized quickly at the higher temperatures and remained relatively constant throughout the remaining exposure period. Acclimated rate-temperatures curves (R-T curves), acute R-T curves and Q10 temperature coefficients used to assess the significance of the changes in rate frequency and to compare the species in an ecologically meaningful way, showed that several adaptive types occurred among and between species. This suggests that the temperature increases had a negligible effect, that is, little or no thermal stress occurred. (Deal-EIS)

DIATOMS AND WATER QUALITY IN LOWLAND STREAMS IN THE PROVINCE OF NORTHERN BRABANT (THE NETHERLANDS),
Rijksinstituut voor Natuurbeheer, Leesum (Netherlands).
H. V. Dam.
Hydrobiological Bulletin, Vol 13, No 1, p 13-21, 1979. 2 Fig, 2 Tab, 19 Ref.

Descriptors: *Sewage effluents, *Toxicity, *Diatoms, Trophic level, Oligotrophy, Mesotrophy, Dominant organisms, Water chemistry, Hydrogen ion concentration, Agricultural wastes, Streams, *Holland.

The diatoms of two Dutch lowland streams were studied. The stream Beerze is heavily polluted by the effluent of a sewage treatment plant, causing a change in the pH from less than 4 to more than 6. The acidobiontic diatom Eunotia exigua is replaced by more alkaline and eutraphentic species such as Gomphonema parvulum, Cyclotella meneghiniana and Fragilaria capucina. The Simpson diversity index rises to 0.2 in the upper course to 0.9 in the middle course and maintains this level on the lower course. From the stream Rosep samples of 1919-1930 and recent ones were studied. This stream is now polluted by agriculture. In the earlier samples oligo-mesotraphentic species dominated (Eunotia spp., Melosira distans). In 1976 the species of organically polluted waters were most abundant. The oligo-mesotraphentic species were hardly recovered. In spite of the severe pollution the number of rare species in both streams is still high, compared with that in stagnant waters. Only in mesotrophic moorland pools and mesotrophic quivering bogs, which are situated in trophic gradients just like both streams, which are situated in trophic gradients just like both streams, a comparable number of rare species may be found. Descriptors: *Ammonia, *Toxicity, *Fish behavior, *Research equipment, Methodology, Analytical techniques, Chlorides, Salmonids, Brook trout, Chinook salmon, Predation, Fish populations.

The present study was undertaken to (1) devise an experimental apparatus to permit study of the impact of ammonia on predator-prey interactions involving salmonid fishes in a flowing water system and (2) quantify the effects of sublethal levels of ammonia in this system. This report describes the apparatus and the influence of ammonium chloride on consumption of salmon fry by trout in laboratory streams. The system was found to be useful in monitoring chloride on consumption of salmon fry by trout in laboratory streams. The system was found to be useful in monitoring the effects of ammonium chloride on the baseline predator-prey interactions. The predator consumption rates were either depressed or elevated, depending on the concentration of NH3 and the density of the prey. Other types of organism responses like territorial responses, courtship or breeding responses, and food utilization are examples of effects which may be influenced by sublethal exposure to environmental contaminants and which could be tested in this type of system. SAND FILTRATION OF OXIDATION POND EFFLUENT FOR REUSE IN PARK IRRIGATION,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
D. Kasper, R. Phillips, R. Sierka, and N. Myers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-140098, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona, Tucson, Project Completion Report, January 1980, 64 p, 28 Fig, 7 Tab, 11 Ref. OWRT A-052-ARIZ(1), 14-31-0001-5003.

Descriptors: *Water reuse, *Oxidation pond effluent, *Water pollution treatment, Sand filtration, Irrigation water, Algae filtration, Oxidation pond reuse.

This study is an investigation of intermittent sand filtration of oxidation pond effluent utilizing local river bed sands as filter media. The only related research utilizing oxidation pond effluent was a laboratory and field scale study conducted at Utah State University. The experimental set-up for this investigation consisted of several laboratory scale filter columns filled with local river bed sands. These columns were dosed at a selected rate and sequence with oxidation pond effluent. The parameters investigated included depth, dosing sequence, and hydraulic loading rate. Reproducibility and the effects of column diameter were also investigated to insure the validity of results. The results of the quality parameters investigated, including COD, volatile and total suspended solids, turbidity and algae concentration, were evaluated statistically. Findings included the following: (1) A slight improvement in filtrate quality occurred in the smaller diameter columns. (2) Filtrate quality improved significantly with increasing filter depth. (3) Only slight differences in filtrate quality were found for filters operated on three and four day dosing cycles. (4) Filtrate quality deteriorated with increased hydraulic loading rates. (5) Continuous operation of filters resulted in clogging.

In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska on November 4-5, 1976. p 73-87. 7 Fig, 8 Ref.

Descriptors: *Rural areas, *Alternative planning, *Disposal, *Waste water treatment, Water quality, Groundwater, Discharge(Water), Costs, Waste water disposal, Surface waters, Absorption, Sewage lagoons, Sewage treatment, Sewage, Water pollution treatment, Activated sludge, Septic tanks.

Design of wastewater treatment processes should be compatible with the final disposal site, assuming either groundwater or a surface water body. Treatment before discharge to surface waters requires complete removal of solids, biodegradable organic material (BOD) and infectious agents (disinfection). Any additional material which pollutes the water, such as color, heavy metals, or other toxic material, must also be removed. This can be accomplished by using a package plant, septic tank and sand filter system, or lagoon or stabilization basin followed by sand filters. Package plants are small activated sludge type treatment systems. Lagoons and stabilization basins are ponds in which wastewater is held for a few days to several months. Suspended solids and oxidizable materials are removed by bioflocculation, sedimentation, oxidation, and reduction. With groundwater disposal, the ground itself is the primary treatment medium. A septic tank pretreats wastewater before it is applied to the ground in order to prolong the life of the disposal site. The basic ground application system is the absorption trench. Bed and chamber systems overcome problems with low soil permeability. The mound system overcomes problems of shallow depth to an impermeable stratum and high groundwater tables. Costs vary greatly with size and construction type. Generally, the least expensive system in favorable soil is a septic tank-absorption trench. (See also W78-11244) (Danovich-Wisconsin)

DESIGN OF A SUBSURFACE WASTE DISPOSAL SYSTEM WITH BIOLOGICAL DENITRIFICATION,
Connecticut Univ., Storrs. Inst. of Water Resources.
R. Laak.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-140056, Price codes: A02 in paper copy, A01 in microfiche. Research Project Technical Completion Report, 1979. 20 p, 6 Tab, 2 Fig, 27 Ref. OWRT A-062-CONN(1), 14-34-0001-9007.

Descriptors: *Denitrification, *Waste water treatment, *Design, Waste disposal system, Methodology, Greywater, Carbon source, *Septic tank effluent.

Nitrogen was removed from septic tank effluent in a nitrification-denitrification system, using greywater as the organic carbon source in the denitrification step. A preliminary study showed greywater from a typical home contained abundant soluble carbon that biodegraded at the same rate as methanol, which, until this study, appeared to be the most promising source of organic carbon for such a system. A second laboratory study used aerobic sand column reactors to nitrify unfiltered septic tank effluent, and fixed media columns consisting of stones dimensionally similar to those used in conventional trickling filters to denitrify the waste. Greywater, settled sewage, and methanol were added prior to the denitrification step to determine their suitability as possible sources of organic carbon. Greywater removed 71% of the available nitrate, methanol removed 83%, and set-

tled sewage removed 4.3%. A field demonstration model was then built, using an aerobic subsurface sand filter bed for blackwater nitrification and an anoxic denitrification reactor based on a five day liquid detention time. Some of the greywater from the household acted as the carbon source for denitrification, removing up to 99% of the available nitrate. It was concluded that greywater is an acceptable carbon source for denitrification.
W80-03174

APPARATUS FOR TREATING METAL CONTAINING WASTE WATERS,
Gotzelmann KG Industrieabwasser-Anlagen, Stuttgart (Germany, F.R.). (Assignee).
R. Kammel, and H-W. Lieber.
U.S. Patent No 4,172,780, 10 p, 6 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1209, October 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, *Separation techniques, *Metals, Electrolysis, Cathodes, Anodes, Vibrations, Equipment, Product recovery.

A method for treating metal containing waste water employes a vessel containing the waste water in which there is provided at least one anode and a cathode comprised of electrically conductive elements. The waste water is subjected to electrolysis during which the cathode elements are moved. The cathode elements are provided in the form of rods which are arranged in the vessel by means of at least two holding devices so that the rods extend parallel to one another and can be moved in the holding devices relative to one another. The holding devices are moved during electrolysis so that the rods strike one another again and again at spaced intervals. Since the rods of the cathode strike one another again and again, the deposited layers of metal are continuously separated from the rods so that continuous operation is assured. The relatively few heavy metal rods can be guided in space with great accuracy. It is thus possible to make electrical contacts by means of current leads having a small contacting surface and high areal compressions which results in very low transfer resistance and thus a low voltage requirement. Furthermore the anodes can be brought very close to the cathode. This results in low energy requirements and consequently relatively little heating of the electrolyte. (Sinha-OEIS)
W80-03265

WASTE WATER PROCESS FOR TREATMENT OF STRONG WASTES,
Standard Oil Co. (Indiana), Chicago, IL. (Assignee).
J. D. Walk, J. F. Grutsch, and R. C. Mallatt.
U.S. Patent No 4,172,781, 10 p, 1 Fig; 15 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1209, October 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, Separation techniques, Aeration, Activated sludge, Activated carbon, Oxygenation, Powdered carbon.

A waste water process for the treatment of strong wastes is disclosed. Generally the process comprises an activated sludge process for the purfication of waste water comprising: feeding the waste water to a first aeration zone where oxygen is introduced, and the waste water is contracted with activated sludge; passing the effluent from the first aeration zone to a first clarification zone to separate suspended sludge particles from partially decontaminated water; recycling a portion of the separated sludge and passing the partially decontaminated water from the first clarification zone to a second aeration zone; adding about 5 to about 500 ppm powered activated carbon to the partially decontaminated water; oxygenating the water containing carbon; passing the effluent from the second aeration zone to a second clarification zone to separate suspended sludge and carbon particles; and recycling a portion of the separated sludge and carbon and passing the decontaminated water out. (Sinha-OEIS)
W80-03266

PROCESS FOR THE SEPARATION OF CADMIUM (CD++) IONS FROM SEWAGE, WASTE WATER AND AQUEOUS SOLUTIONS,
Deutsche Gold- und Silber-Scheideanstalt A.G., Frankfurt am Main (Germany, F.R.).
H. Knorre, G. Pohl, and K. Stutzel.
U.S. Patent No 4,172,784, 4 p, 6 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1210, October 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Industrial wastes, Cadmium, Separation techniques, Chemical precipitation.

Cadmium (Cd++) ions are separated from an effluent containing complexing agent such as nitrilotriacetic acid, ethylenediamine tetraacetic acid and/or diethylenetriamine pentaacetic acid, or their anionic salts by using an HS-containing triazine compound and Fe+++ ions in a quantity at least equal to the amount of complexing agent. (Sinha-OEIS)
W80-03270

OUTLET FOR SEPTIC TANKS,
C. V. Perry, Jr.
U.S. Patent No 4,172,799, 7 p, 6 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1215-1216, October 30, 1979.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Septic tanks, Pollution abatement, Soil disposal fields, Equipment.

A septic tank has an improved outlet which may be readily installed in existing septic tanks without modification of the tank or outlet fittings, to prevent the discharge of particles of sewage suspended in the effluent from passing directly into the drain field. The outlet includes a 'T', a dual conic deflector composed of two cones jointed at their bases and flexibly supported directly below the open lower end of the 'T'. Effluent containing solid particles rising from the bottom of the tank during the fermentation process is deflected. The flexible mounting permits sidewise displacement of the conic deflector so that the upright portion of the 'T' can be reamed to remove any accumulation of deposits. The conic deflector is weighted so as to return to its original position after the reaming operation has been completed. (Sinha-OEIS)
W80-03273

METHOD FOR THE SEPARATION FROM EACH OTHER OF THE COMPONENTS OF A MIXTURE OF WATER, OIL AND DIRT (SLUDGE) AS WELL AS APPARATUS FOR PERFORMING SAID METHOD,
H. J. Ankersmit.
U.S. Patent No 4,176,068, 7 p, 2 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1052-1053, November 27, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Separation techniques, Oil pollution, Oily water, Sludge, Flow separation, Equipment, Ballast water.

A method and apparatus is described for separating into components a mixture of water, oil and sludge. The mixture is poured out of a downwardly-directed conduit onto the upper surface of a conically-shaped chamber having a discharge flow capacity at its lower end corresponding to the sludge volume content of the mixture. The oil and water are drawn off and conducted to a chamber formed at the lower surface of the conically-shaped chamber upon which the mixture was initially discharged. One or more filters are provided at the bottom portions of the second chamber to separate the oil and water. By continuously discharging heavy components from the narrow portion of the chamber, separation takes place between heavy components and lighter components. The lightest component (the oil) will rise as far as possible and form a layer which is continuously discharged, while a quantity of mixture formed by light components (water, oil and light sludge) will collect between the upper side of the chamber and it is continuously discharged to undergo a further separating treatment. (Sinha-OEIS)
W80-03274

GRAVITATIONAL FLOW SEPARATOR OF THE MULTIPLE, APERTURED TUBE TYPE FOR SEPARATING WATER FROM SAND, GRAVEL OR THE LIKE,
A. H. Sloan.
U.S. Patent No 4,176,066, 7 p, 10 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1052, November 27, 1979.

Descriptors: *Patents, *Waste water treatment, Water pollution treatment, Separation techniques, Sands, Coarse sediments, Storm drains, Flow separation, Equipment, Construction equipment.

A dewatering separator device for separating solid particles such as sand, gravel, or the like from water, preconditions the water either for further filtering elsewhere or for permitting the water to be accepted in storm drains. The separator device is of the gravitational flow type and includes vertically arranged tubes, each of which has small apertures in the form of thin slits in their side walls. The mixture of solid material, i.e., sand, gravel, etc. and water is dumped through the top of the tubes, causing the heavier solid material to pass through the tubes where it is collected in a constituent trap, and from which the material is periodically discharged at one location. The water passes through the small slits in the sidewalls of the tubes and is discharged. The device has a movable support to render it portable for transport to different job sites. (Sinha-OEIS)

A STUDY OF THE EFFICIENCY OF SEPTIC TANK EFFLUENT TREATMENT IN TWO RAISED BED SYSTEMS,
Maine Univ. at Orono. Dept. of Civil Engineering.
G. S. Nault.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-140189, Price codes: A09 in paper copy, A01 in microfiche. MS thesis August 1979. 187 p, 85 Fig, 38 Tab, 22 Ref, 1 Append, OWRT A-040-ME(2).

Descriptors: *Sewage treatment, *Septic tanks, *Waste water disposal, Environmental sanitation, Soil moisture, Soil physical properties, Sands, Clays, Chemical oxygen demand, Biochemical oxygen demand, Ammonia, Coliforms, Nitrogen, Water table, Maine, Raised beds, Mound systems.

Two raised bed systems for distribution of septic tank effluent located in Orono, Maine, on soils not suitable for conventional septic tank soil absorption systems were studied to determine treatment performance under given trench and site conditions. The two 'mound' systems were installed at private homes and chemical, physical, and biological parameters were monitored during 1978 and 1979. The first system, built according to the Maine State Plumbing Code, was a large 125 ft by 44 ft mound with the bottom of the absorption trench located 4 ft below the top of the mound. The 75 ft trench was 1 ft deep and 5 ft wide running east to west. The second system used less sand and had a pumping system for effluent distribution. It was 45 ft by 100 ft with 6 absorption trenches 3 ft wide by 1 ft deep and 29 ft long with an overall mound height of 3 ft. Sand fill for both mounds came from the same pit. Marine clay barriers were used to seal the mounds. Parameters monitored include; soil moisture, chemical oxygen demand, biochemical oxygen demand, ammonia nitrogen, organic nitrogen, nitrate nitrogen, chloride, coliforms, water level, and flow. Results show that groundwater table location in relation to the sand fill is a dominant factor in treatment efficiency. Sand fill treatment efficiency decreased as saturation conditions

increased. Marine clay was found to be an effective treatment medium given effective pretreatment and distribution of septic tank effluent. Neither system showed signs of freezing in winter although lower temperatures did decrease sand fill treatment efficiency. (Seigler-IPA)

ENVIRONMENTAL INFLUENCES ON THE DEVELOPMENT OF OIL-DECOMPOSING MICROORGANISMS,
Northern Research Inst. of Hydraulic Engineering and Land Reclamation, Kazan Reclamation, Kazan (USSR). Dept. of Hydrology and Water Resources.
N. V. Morozov, and V. N. Nikolayev.
Hydrobiological Journal, Vol 14, No 4, p 47-53, 1978. 3 Fig, 1 Tab, 16 Ref.

Descriptors: *Microbial degradation, *Oil, *Water temperature, Hydrogen ion concentration, Oxidation, Bacteria, Nitrogen, Phosphorus, Metabolism, Pseudomonas, Respiration, Growth rates, Oxygen requirements.

Oil-decomposing microorganisms are shown to be highly biologically active in the purification of water from oil in the range pH 5-9. Temperatures of 20-28C are conducive to their development, but they also grow intensively and maintain a high rate of oxidation of oil at low temperature (6-8C). Readily oxidizable organic matter and biogenous elements in the form of ammonium salts of nitrogen and phosphorus must be added to the medium to maintain the physiological activity of the microorganisms. (Deal-EIS)

5F. Water Treatment and Quality Alteration

POLYMERS FOR PREVENTING AND REMOVING SCALE IN BOILERS,
Nalco Chemical Co., Oak Brook, IL. (Assignee).
K. G. Phillips, and J. F. Kneller.
U.S. Patent No 4,171,988, 4 p, 1 Tab, 1 Ref; Official Gazette of the United States Patent Office, Vol 987, No 4, p 937, October 23, 1979.

Descriptors: *Patents, *Water treatment, *Industrial water, Demineralization, Scaling, Hardness(Water), Boiler feed water, Heated water, Chemical reactions, Descaling, Polymers.

Water-soluble ampholytic polymers formed by reacting chloroacetic acid with a cationic polymer formed by reacting epichlorohydrin and ammonia are effective in removing and inhibiting calcium formation in boilers under conditions in which steam is generated under pressures ringing from 15 p.s.i. up to about 1500 p.s.i. The ampholytic polymers may be added either to the boiler feedwater or directly to the water in the boiler where the steam is generated. To accomplish close additive control, the polymers are added in aqueous solution form wherein the active ingredient comprises from about 10% up to the maximum of solubility of the polymer in water. An alkaline material may be required to adjust the boiler water to within the desired pH range. (Sinha-OEIS)
W80-03103

POLYPHOSPHATE-BASED INDUSTRIAL COOLING WATER TREATMENT,
Nalco Chemical Co., Oak Brook, IL. (Assignee).
G. T. Farley.
U.S. Patent No 4,172,032, 9 p, 6 Tab, 7 Ref; Official Gazette of the United States Patent Office, Vol 987, No 4, p 952, October 23, 1979.

Descriptors: *Patents, *Water treatment, *Cooling water, *Industrial water, Scaling, Corrosion, Chemical reactions, Polyphosphates.

When a specific condensed phosphate glass is combined with an organic phosphate ester, an improved composition is afforded for preventing scale and corrosion in industrial cooling systems. Optionally, certain azoles are combined with the phosphate glass and phosphate ester to afford protection to non-ferrous metals. (Sinha-OEIS)
W80-03139

OZONATION OF COOLING TOWER WATERS,
M. F. Humphrey, K. R. French, and R. D. Howe.
U.S. Patent No 4,172,786, 5 p, 1 Fig, 1 Tab, 3 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1211, October 30, 1979.

Descriptors: *Patents, *Water treatment, *Water quality control, Industrial water, Cooling water, Scaling, Corrosion, Ozone.

Continuous ozone injection into water circulating between a cooling tower and heat exchanger with heavy scale deposits inhibits formation of further deposits, promotes flaking of existing deposits, inhibits chemical corrosion and controls algae and bacteria. (Sinha-OEIS)

W80-03272

5G. Water Quality Control

METHOD FOR PREVENTING THE CONTAMINATION OF SUBSOIL WATER FROM PRODUCTS DEPOSITED ON THE GROUND OR IN UNDERGROUND CAVITIES,
C. O. Morfeldt.
US Patent No 4,171,921, 6 p, 3 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 987, No 4, p 914, October 23, 1979.

Descriptors: *Patents, *Subsurface water, *Water quality control, Water pollution control, Pollution abatement, Underground structures, Tunnels, Sinks, Water levels, Flow, Velocity.

A method for preventing the contamination of subsoil water by harmful substances which originate from an object at or near ground level is described. A tunnel having a water permeable wall is formed below the natural water level to thus form a sink funnel in the subsoil. The accumulated water in the tunnel is drained away quickly enough so that the velocity of water movement toward the tunnel exceeds the water velocity in all other directions. (Sinha - OEIS)
W80-03025

OUTDOOR ALGAL MASS CULTURES--I. APPLICATIONS,
Woods Hole Oceanographic Institution, MA.
J. C. Goldman.
Water Research, Vol 13, No 1, p 1-19, 1979. 10 Fig, 1 Tab, 111 Ref. U.S. Dept. of Energy EG-77-S-02-4151.

Descriptors: *Algae, *Photosynthesis, *Cultures, *Technology, Waste water treatment, Production, Universities, Energy, Solar energy, Mass, Research priorities, Resource development, Application methods, Engineering, Research and development, Proteins, Foods, Food processing industry, Chemicals, Nutrients, Recycling.

Traditional and new applications for outdoor algal mass cultures are discussed. Early efforts were directed towards single-celled protein production for human consumption; however, many new applications have evolved including wastewater treatment, water renovation, nutrient recycling, chemical production, aquaculture, and bioconversion of solar energy. Mass algal culturing problems relate to culture mixing, nutrient availability and addition, species control, CO2 addition, water supply and evaporation and algal separation and harvesting. Algal yields up to 30-40 g dwt/sq m d have been reached for short time periods and yields between 15-25 g dwt/sq m d for longer periods are now common. Algal mass culturing on a large-scale is not a feasible solution for protein production or solar energy conversion, however, the process has high potential in wastewater treatment, aquaculture, and as a source of certain chemicals such as glycerol. Recent works of Oswald at Berkeley, Ryther at Woods Hole, and Shelef in Israel, show that algal systems have great versatility for solving environmental problems, particulary when designed as integrated-multi-use systems for wastewater treatment, water renovation, nutrient recycling and animal protein feeding. (Danovich-Wisconsin)
W80-03105

FLOATING OIL SKIMMER,
D. E. Morris.
U.S. Patent No 4,172,036, 6 p, 5 Fig, 9 Ref; Official Gazette of the United States Patent Office, Vol 987, No 4, p 953, October 23, 1979.

Descriptors: *Patents, *Oil pollution, *Water quality control, *Separation techniques, Skimming, Floating, Equipment, Oil recovery.

An apparatus for removing oil floating on water comprises buoyant means for floating the apparatus and at least one set of rotatable discs having spaced apart, generally parallel, vertically oriented discs. Each disc has an outer edge and generally collinear centers. The sets of disc are mounted on the buoyant means so that the discs are partly submerged. A drive means rotates the discs so that oil floating on the water adheres to the discs and is moved away from the water surface as the discs rotate. The oil adhering to the discs is removed and directed to a storage location. Preferably, the apparatus has three sides and three corners, one set of discs being mounted along each side in a triangular arrangement. (Sinha-OEIS)
W80-03143

GROUND-WATER SALINITY PROBLEMS RELATED TO IRRIGATION IN THE COLORADO RIVER BASIN,
Tennessee Valley Authority, Norris, TN. Office of Natural Resources.
M. T. El-Ashry.
Ground Water, Vol 18, No 1, p 37-45, January-February 1980. 8 Fig, 4 Tab, 23 Ref.

Descriptors: *Salinity, *Groundwater, *Irrigation, *Colorado River Basin, Saline water, Salts, Water quality, Water quality control, Leaching, Aquifers, Irrigation water, Irrigation practices, Irrigation operation and maintenance, Irrigation effects, Agriculture.

The groundwater system in many of the irrigated areas of the Colorado River Basin is derived almost entirely from deep percolation of irrigation water and seepage from irrigation conveyance and tailwater collection systems. Salt pickup rates from irrigated soils in the basin vary in the different areas. Among the high salt pickup areas is the Grand Valley in western Colorado, estimated at 8 tons/acre/year. Water entering the groundwater supply from irrigation practices in the valley amounts to about 145,000 acre-feet/year and contributes about 690,000 tons/year to the salt load of the Colorado River. Samples of base-flow water from the weathered Mancos Shale aquifer in the valley vary in salinity from about 1,500 to about 9,000 mg/l with a mean of 4,100 mg/l; while water samples from alluvial aquifers range from 305 to 124,000 mg/l with a mean of about 11,500 mg/l. Base-flow returning to the river in the drains and washes has concentrations that average about 4,200 mg/l. Water losses and quantities of irrigation return flows can be reduced by improving farm irrigation efficiencies and by partial or complete lining of canals, laterals, and ditches. Increasing on-farm irrigation efficiency through system improvements and irrigation scheduling is the most cost-effective measure. However, achievement of higher efficiencies will require changes in water laws to encourage conservation and revised water pricing policies that discourage waste. (Sims-ISWS)

WATER PURIFIER APPARATUS,
Teledyne Industries, Inc., Ft. Collins, CO. (Assignee).
T. E. Corder.
U.S. Patent No 4,172,796, 10 p, 13 Fig, 11 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1214-1215, October 30, 1979.

Descriptors: *Patents, *Water treatment, *Water purification, Water quality control, Filtration, Domestic water, Filters, Valves, Taste, Odor, Filter cartridges.

A water purification device includes a housing having a base portion and a generally-cylindrical cup-shaped cap removable secured to it. An input fluid channel in the base portion communicates with one end of the chamber defined by the cup and an outlet fluid channel communicates with that chamber end. A filter cartridge placed within the cap has a conduit that extends between its opposite end walls. Filter material surrounds the conduit. An inlet opening in the cartridge is positioned to communicate with the input fluid channel so as to permit water to flow through the filter material. An outlet opening in the cartridge is arranged to communicate from the filter material to the other end. A valve is included in an extension of the base portion in order to selectively control the distribution of water. The valve itself has a bore and a corresponding stem which are longitudinally tapered. (Sinha-OEIS)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

TOWARDS A DEFINITION OF DROUGHT,
Ministry of Overseas Development, London (England).
S. Sandford.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 33-40, 1979. 2 Fig, 1 Tab, 7 Ref.

Descriptors: *Droughts, *Water shortage, *Analytical techniques, *Botswana, Regional analysis, Planning, Probability.

Although people tend to define drought in ways that best suit their needs, there are occasions such as insurance, government legislation, regulations, planning, prediction, etc., when a precise definition is required. A logical concept of drought as a rainfall-induced shortage between the supply of a good and the requirements for that good, is developed here that incorporates several additional useful elements and one which can be extended to yield useful practical results for policy makers in terms of rough quantitative estimages of the effects of different degrees of severity. Such a quantitative application of the concept is illustrated here for livestock feed in Botswana in which the probabilities of drought of given degrees of severity occurring in different regions are calculated. (Tickes-Arizona)

BOTSWANA'S PRESENT CLIMATE AND THE EVIDENCE FOR PAST CHANGE,
University Coll. of Botswana, Gaborone. Dept. of Geography.
H. J. Cooke.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 53-58, 1979. 15 Ref.

Descriptors: *Weather forecasting, *Paleoclimatology, *Environmental effects, *Botswana, *Decision making, Variability, Rainfall, Agroclimatology, Africa.

Botswana's climate, determined principally by its position in the center of southern Africa and its latitudinal position, is unreliable and therefore marginal. This review of this largely arid country's present climate and the evidence for past climatic change indicates that (1) in southern Africa, including Botswana, there is strong statistical likelihood of below-average rainfall in the next decade, (2) the earth appears to be entering a period of greater climatic variability, and (3) pressure on Botswana's already fragile ecosystem is heavier than ever before. On this basis it is concluded that if the effects of fluctuations in atmospheric circulation are not generally understood, agricultural productivity will become less stable, centralized systems will become more vulnerable, and there will be greater need to insulate communities. Information regarding the impact of climatic variability on human activities is essential to government decisions. (Tickes-Arizona)

AUSTRALIAN DROUGHT WATCH SYSTEM,
Bureau of Meteorology, Melbourne (Australia).
D. M. Lee.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collabration with Clark University Press. p 173-208, 1979. 21 Fig, 9 Tab, 1 Ref.

Descriptors: *Forecasting, *Droughts, *Meteorological data, *Monitoring, Australia, Computer programs, Rainfall, Data transmission.

Operation of a computerized drought alert system introduced by the Bureau of Meteorology in Australia in 1974 to remove subjectivity from the selection of analysis areas, and to speed up the publication of the Drought Review, is described here in detail. The System, based on the monthly rainfall totals of some 800 selected stations telegraphically reporting throughout Australia over a period of at least 40 years is compared to the previous manual method for the 1972 Australian drought, with an example of its application to Mahalapye in Botswana. It is concluded that this newer computerized system enables a better delineation of areas of rainfall deficiencies than was apreviously available under a subjective system. By performing many of the calculations prior to the end of the month, it is now possible to make probability statements about the state of rainfall deficiencies that will exist some three weeks into the future, and it is hoped that the system, when applied worldwide, would establish an alerting and advisory approach on a routine objective basis for areas where there is concern for rainfall deficiencies. (Tickes-Arizona)
W80-03072

AN ASPECT OF WARNING SYSTEMS FOR DROUGHT: INFORMATION COLLECTING IN THE DISTRICTS,
Botswana Ministry of Local Government and Lands, Gaborone.
E. Wily.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone, Published by the Botswana Society in collaboration with Clark University Press. p 211-218, 1979. 3 Ref.

Descriptors: *Droughts, *Forecasting, *Botswana, *Comprehensive planning, Project post-evaluation, Monitoring, Local governments.

Over the last 12 months, the Ministry of Local Government and Lands of Botswana has actively pursued a strategy of decentralized planning, enabling districts to formulate their own immediate as well as five-year plans for incorporation in the overall Fifth National Development Plan (1979-1985). The Drought Committee has further recommended that districts individually devise procedures for monitoring drought conditions or indications, and associated procedures for implementing drought relief for which they will be responsible. It is the purpose of this paper to elucidate the guidelines or framework by which the individual districts are to carry out this task and to document how far this particular element of drought planning has progressed over the past twelve months. Water-related elements include rainfall, livestock water supplies, and grazing conditions. Not all districts have yet complied with the Ministry's request for the establishment of a drought warning system, but procedures presented by five districts in compliance are reviewed here. (Tickes-Arizona)
W80-03073

DROUGHT AND ARABLE FARMING,
Botswana Ministry of Agriculture, Gaborone.
D. B. Jones.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 234-239, 1979. 2 Fig, 9 Ref.

Descriptors: *Droughts, *Livestock, *Future planning(Projected), *Arable land, Farm management, Administration, Botswana, Seeds.

Although drought in Botswana is often thought of in terms of its effects on livestock and ranges, more general considerations indicate that arable and livestock droughts frequently exhibit both temporal and economic differences. While pointing out that this comparison of the pure pastoralist with the pure arable farmer is somewhat academic, since most Botswana farming households are involved in mixed farming, it is emphasized here that there are strong ties between the two enterprises and that a failure in one will often cause a serious problem in the other. A conjectural look at the recovery of arable agriculture indicates that the government needs to be far more concerned with the problem of multi-year drought than single season drought, regardless of whether these are arable only or arable-plus-livestock droughts. Some suggestions of possible measures to assist post-drought recovery are offered and discussed in terms of policy implications, including seed storage for use in times of drought-induced shortages, and contract ploughing. The author presents these as preliminary ideas only, and urges greater official consideration of not only these but other options as well. (Tickes-Arizona)

THE TRIBAL GRAZING LAND POLICY'S RELEVANCE IN A DROUGHT-PRONE ENVIRONMENT,
International Livestock Centre for Africa, Addis Ababa (Ethiopia).
R. R. Von Kaufmann.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with the Clark University Press. p 255-260, 1979. 2 Fig, 9 Ref.

Descriptors: *Droughts, *Grazing, *Pasture management, *Botswana, *Water allocation(Policy), Equitable apportionment, Comprehensive planning.

Botswana's Tribal Grazing Land Policy (TGLP), an open and comprehensive land reform program, is analyzed here in terms of its relevance in a drought-prone environment where the unregulated development of water sources by individuals who tend to dominate the use of surrounding tribal lands has been curtailed. Recognizing that the present common ownership of land forces individuals to maximize their private wealth in livestock at the expense of the commonwealth of rangeland, the hypothesis of the TGLP is that creation of smaller, more manageable land units with which individuals can identify, is the best most equitable way of generating a proprietary interest in long-term husbandry of range resources. While no conclusions about the relevance of this policy can be drawn yet, it is assumed that if this reform continues to move in the direction of providing manageable farming units with control over defined land areas accompanied by a move towards more sophisticated technology, it will be highly relevant to drought recovery. A PROCESS FOR COMMUNITY FLOOD PLAIN MANAGEMENT.
Leman Powell Associates, Inc. Alexandria, VA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-135296, Price codes: A06 in paper copy, A01 in microfiche. Office of Water Research and Technology Planning Manual OWRT TT/79 9, November 1979. 121 p, 8 Fig, 7 Tab, 27 Ref, 5 Append. OWRT T-0008(6707)(1), 14-34-0001-6707.

Descriptors: *Flood plains, *Flood control, *Planning, *Management, Flood damage, Design flood, Flood protection, Flooding, Flood plain zoning, Floodways, River flow, Flood stages, Legal aspects, Flood plain insurance, Risks.

Guidelines for the process of preparation and management of plans for the reduction and avoidance of flood damage in flood plain areas are presented. Flood plain management is the combination of appropriate measures to deal with a flooding problem in a particular area. These measures may be structural (dams, levees, floodwalls, diversions, and channel improvements) or nonstructural (land use regulations and zoning). An initial planning step is the evaluation of the flood plain to identify and delineate the area. Three types of land subject to flooding are riverine flood plains, coastal flood plains, and especial flood plain areas such as shallow flooding areas, wetlands, and sinkholes. Aspects to be included in an evaluation include economic, social, political and organizational, and environmental. Suggested evaluation processes are summarized. The general planning process is described along with a review of the variety of means and tools available for flood plain management implementation. Other management planning information provided includes legal framework, and technical and financial assistance available. Finally the process for bringing together all the aspects of planning is described and an example is given. (Seigler-IPA)

MANAGEMENT OF WATER RESOURCES - A CO-OPERATIVE GAME-THEORETIC APPROACH TO INTER-STATE PROBLEMS,
P. K. Rao.
ASCI Journal of Management, Vol 8, No 1, p 1-13, September 1978. 1 Tab.

Descriptors: *Simulation analysis, *India, *Water allocation(Policy), *Federal-state water rights conflicts, *Administrative agencies, Systems analysis, Equitable apportionment, Cost-benefit analysis, Economics, Cost sharing, Political constraints, Institutional constraints, Japan, Water resources development, Regulation, Federal government, U.S. Water Resources Council, State governments, Water rights.

An analytical methodology based on cooperative game theory, previously reported from a water resources system case study in Japan, is tested for equitable of costs and benefits of interstate water allocation in India. The study also discusses the potential for greater utilization of water resources in India, reviews political and administrative historical highlights of federal-state and interstate water resources management characteristics in that country, and calls for establishment of an Indian national water resources council. The methodology adapted from Mitsuosuzuki and Mikonakayama (1976) fixes fair distribution of costs and benefits as a linear programming problem involving calculation of the minimum cost of a coalition of state governments in meeting water requirements, posited against the minimum cost of an individual state in meeting those requirements without cooperative assistance. Provision is also made for physical, political and institutional constraints. Application to certain present-day Indian interstate water allocation disputes shows that this approach can provide negotiation solutions only in limited cases. In federal-state relationships it is useful only where there are no national competing claims on a water supply sought by a state. To mediate in these latter disputes, a national water resources council is proposed which would be coordinated by the national government. Indian states, fearing control of such a council by the national government, have strongly opposed such a scheme. (Harris-Wisconsin)

FLOW ROUTING IN THE SUSQUEHANNA RIVER BASIN: PART II LOW-FLOW FREQUENCY CHARACTERISTICS OF THE SUSQUEHANNA RIVER BETWEEN WAVERLY, NEW YORK AND SUNBURY, PENNSYLVANIA,
Geological Survey, Harrisburg, PA. Water Resources Div.
D. L. Bingham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-301 392, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-52, June 1979. 31 p, 17 Fig, 6 Tab, 5 Ref.

Descriptors: *Model studies, *Low-flow frequency, *Flood routing, *Streamflow, *Simulation analysis, New York, Pennsylvania, Frequency curves, Analytical techniques, Evaluation, Flow rates, Gaging stations, *Ungaged sites, *Susquehanna River basin(PA), Susquehanna River Basin Commission.

Six flow-routing models were developed, calibrated, and verified for the Susquehanna River between Waverly, New York, and Sunbury, Pennsylvania. The models give the Susquehanna River Basin Commission tools to estimate effects of water-resource developments upstream from Waverly upon four gaged sites and two ungaged sites within the study reach. The models were used to simulate a 32-year record of daily flows at the two ungaged sites. Low-flow frequency curves for simulated flows at these sites were used to estimate 7-day low-flows at the 10-year recurrence interval of 540 and 770 cubic feet per second, respectively. The model errors, differences between model results and observed streamflow at gaged sites, are considered to be within reasonable limits and overall quality of simulated streamflow and low-flow frequency curves is considered good. ESTIMATED DRAWDOWNS IN THE FLORIDAN AQUIFER DUE TO INCREASED WITHDRAWALS, DUVAL COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
B. J. Franks, and G. G. Phelps.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-119860, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 79-84, 1979. 22 p, 6 Fig, 3 Tab, 24 Ref.

Descriptors: *Drawdown, *Projections, *Aquifers, *Withdrawal, *Analytical techniques, Aquifer characteristics, Hydrogeology, Transmissivity, Storage coefficient, Permeability, Saline water intrusion, Groundwater, Aquifer management, Regression analysis, Simulation analysis, Florida, *Floridan aquifer, *Dade County(FL).

Hydrologic investigations of the Floridan aquifer in Duval County, Florida, have shown that an appropriate simplified model of the aquifer system consists of a series of sub aquifers separated by semipermeable beds. Data from more than 20 aquifer tests were reanalyzed by the Hantush modified method, which takes into account leakance from all confining units. Transmissivity values range from 20,000 to 240,000 square feet per day. Leakance was estimated to be 2.5x10 to the minus 6th power and 3.3x10 to the minus 5th power per day for the upper and lower confining units, respectively. Families of steady-state distance-drawdown curves were constructed for three representative transmissivity values based on hypothetical withdrawals from a point source ranging from 5 to 50 million gallons per day. Transient effects were not considered because the system reaches steady-state conditions within the time ranges considered. Drawdown at any point can be estimated by summing the effects of any hypothetical configuration of pumping centers. The accuracy of the parameters was checked by comparing calculated drawdowns in selected observation wells to measured water-level declines. (Woodard-USGS)

6B. Evaluation Process

MEASURING THE RISKS OF WASTE DISPOSAL BY DEEP-WELL INJECTION,
Marquette Univ., Milwaukee, WI.
C. H. Breeden.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139629, Price codes: A03 in paper copy, A01 in microfiche. Virginia Water Resources Research Center, Virginia Polytechnic Institute and State College, Blacksburg, Bulletin 122, 1980. 42 p, 5 Fig, 3 Tab. 28 Ref. OWRT A-066-VA(2).

Descriptors: *Waste disposal, *Injection wells, *Economic feasibility, Evaluation, *Deep-well waste disposal, Environmental risk.

Much research has been conducted previously on the direct physical costs and the economic effects of changes in operating criteria and design parameters for deep-well waste disposal systems. However, many important considerations, such as the evaluation of risk in the design and operation of a disposal well, have received less attention. This study addresses these injection well failure data, which are important to both industrial and public policy decisionmakers who need to assess the genuine economic feasibility of this disposal method. In addition to identifying the direct costs of deep-well waste disposal, the study (1) illustrates ways in which a decisionmaker might quantify the risks associated with waste injection in an attempt to make these contingent costs explicit, and (2) presents computations for the indirect costs of uncertain risks by using an expected value technique and applying it to several hypothetical circumstances.

THE PROBLEM OF DROUGHT IN BOTSWANA,
University Coll. of Botswana, Gaborone. Dept. of Geography.
H. J. Cooke.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 7-20, 1979. 23 Ref.

Descriptors: *Droughts, *Botswana, *Thermal stress, *Arid climates, Crop response, Water shortage, Weather patterns, Africa, Comprehensive planning, Soil properties.

The drought-sensitive country of Botswana can be characterized by a lack of rainfall severe enough, of long enough duration, and of wide enough extent throughout the country to have a deleterious effect on plant growth, as well as on water supplies for stock use, domestic use, and urban-industrial-mining purposes. Given the poor, erratic, and unreliable nature of its rainfall, along with generally poor-quality soils, Botswana is threatened continuously by potential water shortage stress. Several aspects of this stress are reviewed here to define drought in terms appropriate to Botswana, including its historical patterns, water supply and demand, its relation to man and animal, government research and policy, education, legislation and implementation; and to examine some of its physical aspects and elucidate its causes. DROUGHT SUSCEPTIBILITY SURVEY AND THE CONCEPT OF MONITORING LANDSCAPE ECOLOGY,

International Inst. for Aerial Survey and Earth Sciences, Enschede (Netherlands).
H. Th. Verstappen.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 75-81, 1979. 4 Fig.

Descriptors: *Droughts, *Monitoring, *Comprehensive planning, *Remote sensing, Seasonal, Mapping, Botswana, Surveys.

The evaluation and planning of drought relief in arid and semiarid lands require that complex and diversified factors of anthropogenic as well as climatic nature be continuously monitored. Various modes of remote acquisition of environmental data including the use of aerospace technology to inventory, classify, and evaluate the ecological situation in these drought-prone regions are reviewed here to indicate that careful selection of the most appropriate techniques for specific purposes, such as observation of seasonal variations, drought susceptibility classification, and quantification of the desertification process, is essential in obtaining optimum results. It is hoped that a drought susceptibility map of the whole of Botswana and other countries as well will ultimately become available as an operational tool in combatting the adverse effects of drought. DROUGHT IN THE SAHEL: A BROADER INTERPRETATION, WITH REGARD TO WEST AFRICA AND ETHIOPIA,
International African Inst., London (England).
H. I. Wetherell, J. Holt, and P. Richards.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 131-141, 1979. 4 Fig, 17 Ref.

Descriptors: *Droughts, *Africa, *Sahel, *Pasture management, *Rural sociology, Semiarid climates, Weather data, Economic impact, Social aspects, Monitoring, Rainfall, Planning.

An examination of the recent work on drought in Africa indicates (1) a tendency to underestimate the extent to which drought disaster-proneness relates to and derives from social and economic factors, and (2) a growing awareness of the importance of drought and rainfall unreliability in areas outside the low rainfall extremities of the semiarid zone. To gain a wider appreciation of drought in Africa, areas in Nigeria and Sierra Leone, where climates are quite different from the Sahel proper, and in Ethiopia, where superficial similarities with the Sahel may hide basic differences, are analyzed. At present, the true complexity of Africa's drought phenomenon, in terms of spatial and temporal rainfall fluctuations and their social and economic impact, is inadequately reflected in data from the continent's sparse network of rainfall stations. These authors suggest that much may be gained, nevertheless, from a policy of incorporating local observations and perceptions into drought and rainfall monitoring work. In the absence of high technology monitoring devices, there is every reason why farmers should maintain their traditional close observation to minimize the risks involved in recurrent droughts, and governments and planners would do well to recognize how much they have to learn directly from local farmers and herdsmen. EXPERIENCE OF DROUGHT IN THE SAHEL REGION,
Regional Centre for Training and Application of Agrometeorology and Operational Hydrology, Niamey (Niger).
D. Rijks.
In: Proceedings Symposium on Drought in Botswanna, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 142-146, 1979.

Descriptors: *Droughts, *Networks, *Regional analysis, *Environmental effects, Water supply, Information exchange, Vegetation effects, Sahel, Africa.

Rainfall and drought patterns, the causes of drought and the methods available for dealing with drought in the Sahel are discussed. Drought, described here as a situation in which lack of available water significantly impairs the routine human activities that occur in normal years, including arable farming, livestock husbandry, domestic water supply, health, navigation, and electricity generation, is largely caused in the Sahel by basic meteorological factors. Actions possible for dealing with drought in certain circumstances are multiple, varying according to the physical situation at any one time and place. These actions and their means of implementation are enumerated, with the emphasis largely on the necessity of defining a course of future action to alleviate the detrimental effects of drought. Fundamentally this means a qualitative assessment of the availability of water in the Sahel and the state of vegetation as a result of this water availability. The author's recommendations rest largely on the establishment of information networks between countries affected, including stations where observations on meteorology, hydrology, vegetation, crop growth, and livestock conditions can be made and disseminated daily on an area-wide scale, not only to governments but by radio, perhaps, to individual herdsmen and farmers. BIOLOGICAL BASIS FOR ASSESSING IMPACTS OF CHANNEL MODIFICATION: INVERTEBRATE PRODUCTION, DRIFT, AND FISH FEEDING IN A SOUTHEASTERN BLACKWATER RIVER,
Georgia Inst. of Tech., Atlanta. Environmental Resources Center.
A. C. Benke, D. M. Gillespie, and F. K. Parrish.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139793, Price codes: A10 in paper copy, A01 in microfiche. Report No. ERC 06-79. 201 p, 33 Fig, 33 Tab, 211 Ref, 3 Append. OWRT B-105-GA(1).

Descriptors: *Georgia, *Invertebrates, *Secondary productivity, *Food chains, Population, Standing crops, Food abundance, Environmental effects, Biomass, Aquatic productivity, Aquatic insects, Fish food organisms, Channeling, Aquatic drift, Aquatic habitats, Satilla River.

Invertebrate production dynamics in the Satilla River in Georgia were studied to determine the effect of channelization or other river alterations on animal diversity, productivity, and general river ecology. The 362 km blackwater river has a drainage basin of 9143 sq km with good to excellent water quality. Invertebrates were studied in three major habitats: snags, submerged wooden substrates; the main channel, sandy benthic conditions; and the muddy benthic habitat of backwater areas. Sampling was conducted at two sites on the river, one near Waycross 290 km from the Atlantic Ocean and one at Atkinson 129 km from the ocean. Samples taken to determine the relative importance of the various invertebrate habitats included: (1) quantitative sampling to estimate invertebrate production; (2) invertebrate drift sampling with notation of habitat of origin for drift organisms; and (3) sampling of the feeding habits of major fish species to determine trophic pathways and the habitats of origin of the fish. Results show that the snag habitat had the greatest species diversity, standing stock biomass, and total production with weights of 57 to 72 g dry wt/sq m. Drift samples revealed that approximately 80% of the animals found in the drift originated from the snags. Drift densities were high compared to other rivers with roughly 3 invertebrates/c um. The major insectivorous fish species, redbreast, bluegills, and largemouth bass, are largely dependent upon snags as sources of food. Due to this importance to invertebrates, the removal of snag habitats and/or channelization of the river would cause a significant decline in animal diversity and productivity. (Seigler-IPA)

PROVIDING RURAL WATER: CONSTRAINTS AND IMPACTS,
Cornell Univ., Ithaca, NY. Dept. of Agricultural Economics.
D. Allee, H. Capener, J. Francis, and B. Brower.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska, on November 4-5, 1976. p 27-36.

Descriptors: *Social aspects, *Rural sociology, *Water supply development, *Social impact, *National Demonstration Water Project, Community development, Rural areas, Water supply, Sewerage, Water allocation(Policy), Domestic water, Potable water, Economics, Economic impact, Social adjustment, Local governments, Social needs, Social values, Social participation, Water users, Water utilization.

Social constraints and impacts of providing rural water, collected as part of the National Demonstration Water Project, are summarized. When constraints are removed from rural water development, impacts are produced. Many constraints exist on rural water development; however, most are site-specific. One important impact of water development projects is the production of local community leaders. Community development is stimulated in the long run by leaders who not only solve water problems but other community problems. Passing bond issues is used as an example of trust between community members and their leadership. For the national statistical assessment, a general model of household users and community situations is being developed. The model identifies key household variables for sufficient water quantity and quality. The model reflects not only persons on community water systems but also those located on individual water sources. Social-cultural factors and regional attitudes are considered. Household size, composition, and plumbing type are also included. Various water uses such as drinking, bathing, doing dishes and laundry, water for livestock and gardens, car washing, and lawn watering are also listed. Community assessment consists of identifying a physical problem (lack of water, pollution due to inadequate sewers) the community's awareness of it and whether they have resources available to cope with it. Resources include social resources such as organizational capability and physical resources such as money. (See also W78-11244) (Danovich-Wisconsin)

RURAL WATER: STATE PROGRAMS,
North Dakota Association of REC's, and RTC's, Mandan.
J. Ketterling.
In: Water Problems in the Rural Environment, Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska on November 4-5, 1976. p 37-43.

Descriptors: *Water supply development, *Rural areas, *North Dakota, *South Dakota, *Minnesota, Water supply, Community development, Domestic water, Potable water, State governments, Social needs, Water users, Water utilization, Water quality, Water resources, Water resources development, Governmental interrelations, Costs.

This paper discusses North Dakota, South Dakota, and Minnesota programs on rural water systems development. In North Dakota, underground water quality is extremely poor and quantities are inadequate for basic domestic and livestock needs. North Dakota also faces large-scale coal development. Rural water systems development began in 1971; today four systems are operational, four are under construction, and two other cooperative associations have tentative funding approval from the Farmers Home Administration. Water resources management is under direction of a seven-member commission appointed by the governor; however, no clearly defined coordination exists between the departments of Health and Agriculture and the State Water Commission. Water systems operate under extreme financial pressures because of increasing material and labor costs and the need to bury water lines a minimum of seven feet to prevent winter freeze-up. Average household water bills amount to $25-35 for 6,000 gal/mo.

Experiences in South Dakota are similar with costly installation for rural water systems due to six feet minimum burial of water lines and the sparse population. More rural water systems are now being organized in both North and South Dakota. Minnesota problems include a lack of adequate well records, funds for tests drilling, and technical assistance. Rural electric cooperatives fully support efforts to obtain good quality domestic water for rural families and communities. (See also W78-11244) (Danovich-Wisconsin)

ALTERNATIVE WATER SUPPLY SYSTEMS IN RURAL AREAS,
Iowa State Univ., Ames. Dept. of Civil Engineering.
T. A. Austin.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska on November 4-5, 1976. p 61-72. 2 Fig, 3 Tab, 4 Ref.

Descriptors: *Alternative planning, *Iowa, *Rural areas, *Water supply development, *Economics, Costs, Economic efficiency, Water supply, Water quality, Wells, Regional planning, Regional development, Regional analysis, Domestic water, Potable water, Economies of scale, Rates, Economic feasibility.

This paper discusses relative economies of three alternative rural water supply systems; individual wells, cluster wells and regional wells. No single system is judged best in all cases. Individual wells generally are the most economical solution, provided an adequate supply of good quality water can be obtained from shallow wells. If shallow groundwater resources are limited, cluster wells provide some economy of scale by spreading capital costs over a greater number of users. Regional rural water systems require much larger investments per user. Operational efficiency is higher for cluster wells and regional systems than individual systems. A rough comprison of relative costs of alternative systems was made in a hypothetical area in north central Iowa where farms are far apart, the aquifer is 200 feet deep, and water is very hard (613 mg CaCO3/l) and has high iron contents (3 mg/l). An individual well costs $26.22/mo; this does not include funds set aside for repair or equipment maintenance. A cluster well system costs $25.34/mo which is less than an individual well system. Costs for 8000 gal/mo from three rural water systems currently in Iowa range $26.05-$31.78. Central regional systems advanages include economies of scale, in well and treatment plant, centralized operation and management, and ability to use more sophisticated treatment processes. Regional system capital cost per user is high but monthly costs are not significantly higher than other alternatives. (See also W78-11244) (Danovich-Wisconsin)

THE ECONOMICS OF RURAL WATER SUPPLY,
West Virginia Univ., Morgantown. Regional Research Inst.
P. C. Mann.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska, on November 4-5, 1976. p 91-100. 6 Ref.

Descriptors: *Rural areas, *Water supply, *Economies of scale, Economics, Costs, Financing, Population, Size, Capital costs, Operating costs, Distribution, Maintenance costs, Production, Water treatment, Water supply development, Rates, Consumption, Water utilization, Investment, Social aspects.

Rural water problems are derived from low per-capita incomes coupled with higher costs per consumer connection. Financing problems in rural water supply are largely linked to size disadvantages. Rural systems serving populations less than 10,000 constitute 94% of all water systems but account for less than 20% of population served by all water systems. Most rural communities lack funds needed to absorb initial costs and some even have difficulty covering sustaining costs such as operation and maintenance. For rural water systems, smallness in size tends to preclude potential economies of scale in source of supply, transmission, and treatment. This results in higher operation and capital investment costs on both per user and per output unit basis than for larger urban systems. The market characteristic of low user density means higher initial costs per connection. Low density also means increased transmission costs per connection in periodic system maintenance. Rural water systems generally have users with lower incomes than consumers in urban systems. Less affluent customers consume less water per capita, thus precluding economies of scale in production and distribution. Different types of rate structures such as flat charge, uniform, declining block, and inverted block rates are discussed. Social pricing such as lifeline rates and utility stamps are also mentioned. SOME ASPECTS OF MANAGEMENT-RURAL WATER SYSTEMS,
Utility Management Service, McComb, MS.
C. C. Hale.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska on November 4-5, 1976. p 107-109.

Descriptors: *Water supply, *Management, *Rural area, *Potable water, Water quality, Public health, Costs, Safe Drinking Water Act, Regional planning, Planning, Standards, Water supply development, Taxes, Size, Economies of scale, Water treatment, Distribution, Personnel.

A critical weakness in delivering safe drinking water to rural areas is the lack of management. The purpose of community water systems is to provide adequate supply of safe potable water on a continuous basis and at the lowest cost to consumers. A serious deficiency exists in the lack of measurement standards for a water system's performance. Generally accepted criteria do not exist, although the Safe Drinking Water Act of 1974 will correct major abuses. Most states do not require licenses for water systems managers. Many system operating costs are subsidized by tax revenues. If tax subsidies are not used, management must run water systems on careful budgets. Another major handicap is that lack of overall planning, results in systems which cannot accommodate normal growth without extensive plant and distribution rebuilding. A problem unique to rural water systems is small size and problems of scale. Operating dispersed wells and treatment plants adds to cost and complexity. Early warning systems are needed for malfunctions in order to cope with crises. (See also W78-11244) (Danovich-Wisconsin)

THE USE OF DEVELOPMENT VALUE ESTIMATES FOR COASTAL WETLAND PERMIT DECISIONS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Economics.
L. Shabman, and M. K. Bertelson.
Land Economics, Vol 55, No 2, p 213-222, May 1979. 1 Tab, 20 Ref.

Descriptors: *Wetlands, *Market value, *Land development, *Methodolgy, *Estimating equations, Coastal marshes, Permits, Decision making, Costs, Benefits, Land use, Virginia, Virginia Beach(VA), Planning, Economic efficiency, Value, Regression analysis, Least-squares/method, Wetland filling.

Readily available courthouse records are the data source for an inexpensive procedure for estimating development values of wetlands; the procedure provides economic information about preservation and development uses of marshland for granting of wetland alteration permits. A hedonic price equation, which includes a variable to measure the level of waterfront amenity created from filled coastal marsh, predicts the value derived from filling wetlands for residential development. The net value for development, which is calculated by subtracting development cost, can be compared to the value of natural wetland. The equation was tested using standard regression techniques and data for land parcel sales in Virginia Beach, Virginia. Neighborhoods selected for study were socioeconomically homogeneous as possible to reduce the number of variables. The transfer price of a parcel, which represents the present value of the flow of annual returns, was used instead of prices to account for changes over time. Transfer prices are treated as a function of: (1) location factors; (2) historical factors; (3) improvements; and (4) site amenities. A hypothetical situation applied to the Virginia Beach example results in a net development benefit of $8,232/acre. This value must then be compared to the more elusive value of wetland preservation, which is formatted in terms of rising marginal value, irreversibility, and uncertainty, to determine if a permit should be granted. (Luedtke-Wisconsin)

UNCERTAINTY AND ALLOCATION DECISIONS INVOLVING UNIQUE ENVIRONMENTAL RESOURCES,
North Carolina Univ. at Chapel Hill. Dept. of Economics.
V. K. Smith.
Journal of Environmental Economics and Management, Vol 6, No 3, p 175-186, 1979. 31 Ref.

Descriptors: *Economics, *Investment, *Optimization, *Risks, *Resource allocation, Decision making, Environmental effects, Equations, Mathematical models, Cost-benefit analysis, Projects, Externalities, Planning, Conservation, Project planning, Resources, Regional development.

Modeling of uncertainty affects decision rules for irreversible investments, thus it is important to consider causes of uncertainty. This paper extends Fisher's work to account more directly for effects of the treatment of uncertainty along with irreversibilities in determining optimal investment decisions regarding environmental quality problems. Conventional benefit-cost analysis is oriented mainly toward appraising individual projects. Methodologies which treat each project in isolation lead to inconsistent decision-making where uncertainty is a significant constituent. These planning rules also ignore the potential for risk pooling across projects. These methodological inadequacies remain valid even with Fisher's modification of the Arrow-Lind theorem. Uncertainty arises because planners must estimate net benefits from a given mix of developed and preserved natural environments. Both scale and time of optimal investments may both be altered from those prescribed with conventional (Fisher-Krutilla-Cicchetti rule) frameworks when the potential for risk pooling is introduced. TECHNIQUES FOR REAL-TIME OPERATION OF FLOOD CONTROL RESERVOIRS IN THE MERRIMACK RIVER BASIN,
Hydrologic Engineering Center, Davis, CA.
B. S. Eichert, J. C. Peters, and A. F. Pabst.
Technical Paper No 45, November 1975. 43 p, 18 Fig, 5 Tab.

Descriptors: *Reservoir operation, *Systems analysis, *Flood control, *River regulation, Computer models, Streamflow forecasting, Simulation analysis, Flood damage, Forecasting, Analytical tech-

niques, Hydrologic systems, River basins, Discharge(Water), New England, Merrimack River Basin, Case studies, Real-time operation.

This paper contained a description of the techniques that are under development at The Hydrologic Engineering Center for providing decision criteria on a real-time basis for operating the five flood control reservoirs in the Merrimack River basin. Techniques under development include: (1) testing of alternative streamflow forecasting models; (2) application of computer program HEC-5C, Simulation of Flood Control and Conservation Systems, to develop decision-criteria for system operation on a real-time basis; and (3) use of computer terminals to enable analysis of alternative forecast and/or decision criteria in both batch mode and interactive applications. Each of these techniques were discussed following a brief description of characteristics of the basin, reservoir system, and automatic data collection network. (Humphreys-ISWS)

Available from the National Technical Information Service, Springfield, VA 22161 as PB80-140072, Price codes: A07 in paper copy, A01 in microfiche. Water Resources Research Institute, University of North Carolina, Raleigh, Rpt No 151, November 1979, 120 p, 7 Fig. OWRT A-103-NC(1), 14-34-0001-9035.

Descriptors: *Rural water systems, Investment decision-making, Impact assessment, Secondary impacts, Land use, Induced growth, Regionalization, Economic feasibility, Social impact, Environmental effects, *North Carolina, Rural communities, Water systems.

As a result of increasing rural community demand for urban-type service, concern exists that the installation of rural water systems will induce sprawl development with detrimental impacts. This report presents the results of a study on the formation, expansion and impacts of rural water systems in N.C. in an attempt to strengthen decision-making and project review procedures related to rural water systems. The findings indicate that local decisions regarding the formation and expansion of rural water systems have been based on present and anticipated needs and engineering and financial feasibility analyses. Decisions rarely included factors related to capital improvement budgeting and planning or long-term costs to communities of providing sewerage and other services required by the subsequently induced new development. The authors suggest there is a need for increased attention to local needs, goals and objectives related to location and timing of rural growth. Further, that county land classification plans would enhance the process as well as facilitate suggested local and regional review of proposed water investment plans.

EXECUTIVE SUMMARY: WORKSHOPS ON SOCIO-ECONOMIC ASPECTS,
Nebraska Univ., Lincoln. Dept. of Agricultural Economics.
R. J. Supalla.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska, on November 4-5, 1976. p 119-122.

Descriptors: *Water supply, *Rural areas, *Conferences, *Social aspects, *Economic impact, Planning, Water supply development, Zoning, Land use, Financing, Pricing, Management, Water quality, Standards, Water rights, Governments, Local governments, Public health, Economics, Costs, Rates.

Workshops on water problems in rural areas addressed socio-economic issues classified in nine categories: (1) water system development and planning, (2) zoning and land use impacts, (3) water system financing, (4) water pricing, (5) role of water system managers, (6) water quality standards, (7) impact of section 208 planning, (8) the rural water survey, and (9) water rights. Participants questioned the proper role of the Farmers Home Administration and felt the agency should assume some responsibility for successful administration of water systems they finance. Two widely held views are that local level administrative control is important and that increasingly careful water systems planning is needed to meet public health standards. Another major concern is coping with induced residential developments that occur along water lines. Most participants agreed that water systems should be financed through private enterprise with government subsidies used only as a backup. Also government agencies should consider social as well as economic benefits in deciding which water system to finance. An expanded federal grants program is also needed. Lifeline rate structures should be included in system pricing structures while declining rates should be abolished. 208 water quality planning will have significant impacts on both surface and ground-water sources because it addresses nitrate groundwater accumulations as well as sedimentation and erosion problems. COMMENT ON 'THE EFFICIENCY AND EQUITY OF COST ALLOCATION METHODS FOR MULTIPURPOSE WATER PROJECTS' BY JAMES C. LOUGHLIN,
Environmental Protection Agency, Cincinnati, OH.
L. A. Rossman.
Water Resources Research, Vol 14, No 6, p 1195-1196, December 1978. 1 Tab, 2 Ref.

Descriptors: *Multiple-purpose projects, *Cost allocation, *Equity, *Efficiencies, Optimum development plans, Project planning, Economics, Costs, Separable cost allocation, Cost analysis, Monetary benefits, Model studies, Evaluation.

This comment takes exception to Loughlin's (1977) (See W78-02186) examination of three schemes for allocating costs of multipurpose projects to individual purposes with respect to a set of equity and efficiency criteria. Loughlin concluded that only the separable costs-remaining benefits (SCRB) method will satisfy the equity criterion. Two objections are raised: (1) Certain of the efficiency criteria should not be used for evaluating cost allocation methods; the criteria in question are actually project evaluation criteria and should be applied to the project before any cost allocation is made. (2) Loughlin's adjusted SCRB method actually gives less-equitable results than the original SCRB formula for projects where the justifiable costs with a purpose deleted are given by the alternative cost of providing all other purposes. A revised set of cost allocation criteria separate from the economic evaluation criteria and thus in keeping with the equity principles used by Loughlin would be: (1) The sum of total costs allocated to each purpose should equal total project cost. (2) The total costs allocated to each purpose should not exceed the cost of a single purpose alternative providing equivalent benefits. (3) Savings allocated to each purpose should be in the same proportion as savings realized by including each purpose in the project. The remedy to the problem of the SCRB formula not satisfying the equity criterion is simply to redefine the separable cost of a purpose as the total project cost minus the justifiable cost with this purpose deleted. FINANCING YOUR POLLUTION CONTROL NEEDS,
B. A. Rose.
Industrial Finishing, Vol 54, No 12, p 12-15, December 1978.

Descriptors: *Water pollution, Control, *Equipment, *Electroplating industry, *Small businesses, *Financing, *Bond issues, *Loans, *Government finance, Small Business Administration, Environmental Protection Agency, California, Illinois, Economics, Investment, Cost repayment, Credit, Installation costs, Interest rates, Government supports, Federal Water Pollution Control Act Amendments of 1972(PL 92-500), Industrial production, Industrial wastes, Industrial plants, Pollution abatement.

Tax-exempt pollution control revenue bonds and low-interest loans are two low-cost alternatives for financing the addition of pollution control equipment by electro-platers and other small businesses. For firms needing $100,000 or more, the Small Business Administration (SBA) can guarantee payments on equipment loans or leases with funding through tax-exempt revenue bonds for existing small businesses of groups of businesses. By 1977, pilot programs were operative in California and Illinois, with state/local authorities issuing such bonds backed by SBA. Funds can be used for equipment and construction, bond issuance expenses, application feeds, reserve funding and refinancing of existing debts for equipment. However, procedures take more time than with a conventional loan and firms must not exceed certain size criteria, such as net worth, number of employees, income and other factors. For firms needing smaller loans ($5,000-$50,000), US Environmental Protection Agency (EPA) may make loans for equipment to meet water pollution control requirements. These loans are made to concerns likely to suffer economic injury because of regulatory requirements. Various federal criteria must be satisfied for eligibility, and no business can obtain an EPA loan if reasonable conventional financing is available. In addition, firms must meet small-size criteria as for the SBA tax-exempt revenue bonds financing. Federal loans and loan guarantees for industiral pollution control equipment are also available from the Economic Development Administration and the Farmers Home Adminstration. (Harris-Wisconsin)

MARKET METHODS OF MULTIPLE USE RECONCILIATION,
Victoria Univ. (British Columbia). Dept. of Economics.
G. R. Walter.
Journal of Environmental Management, Vol 7, No 3, p 291-296, November 1978, 2 Tab, 4 Ref.

Descriptors: *Pricing, *Market value, *Willingness-to-pay, *Land resources, *Recreation, *Multiple-purpose projects, Economics, Value, Elasticity of demand, Elasticity of supply, Recreation demand, Natural resources, Forest management, National parks, Camp sites, Boat-launching ramps, Hunting, Fishing, Recreation facilities, Leases.

Theoretical and practical questions of equity and efficiency are discussed in regard to evaluation and

pricing of certain multiple-use services provided by land resources (Such as wood production, wildlife management, watershed benefits, outdoor recreation, range products, and aesthetic considerations). It is suggested that most of these services are in fact marketable, and that many services could be supported by a system of user charges, permit fees or leasing. If there are many uses of a land area under public domain, a number of agencies may have obtained a proprietary interest by legislative mandate; unless there are some explicit measures of the welfare to be gained by the clientele served, so that their increase in welfare may be considered against the cost to the public purse, the result is likely to be an array of services determined solely by relative political strength. A number of basic revenue structures are available to achieve rational economic management of multiple-use services: (1) budgetary allocations out of general revenue (taxes); (2) monies obtained from bids or leases for an identifiable special-interest area such as a historical site, waterfall, small lake, etc; (3) permits for access to forest or other land-based zones; (4) user's fees for use of a marketable services such as camping, picnics, boat launching, etc.; and (5) road tolls for access to the overall multiple-use site or facility. MONOPOLY-POWER AS A MEANS FOR POLLUTION-CONTROL.
A. Endres.
The Journal of Industrial Economics, Vol 27, No 2, p 185-187, December 1978, 5 Ref.

Descriptors: *Economic justification, *Monopoly, *Competition, *Regulation, *Pollution abatement, Economics, Externalities, Water pollution control, Polluter-pays principle, Competitive prices, Model studies, Abatement, Costs, Benefits,.

Many resource economists traditionally hold that allocative distortions caused by monopoly power in the market place and external diseconomies compensate each other; this line of reasoning assumes that a polluting monopolist, producing too much as a polluter and too little as a monopolist, will develop a Pareto-optimal solution for control of pollution. However, this short paper illustrate in theory that monopoly power as a means for pollution control is no more efficient in a perfectly competitive economy than taxes on output instead of pollution to accomplish the same task. It is noted that a polluting monopolist assumed to produce optimal output will realize the optimal level of pollution only if output reduction is the sole means to reduce the externality. When other efficient measures are possible, monopoly power can never correct the allocative failure of an external diseconomy, even in theory, because the monopolist will not use the efficient input mix. These points are demonstrated in a mathematical model of pollution outputs by a perfectly competitive firm and an unregulated monopolist. If firms of a perfectly competitive polluting industry are forced by a Pigovian tax to bear the marginal cost of the damage they cause, the Pareto-optical output and pollution level will be produced. However, with no Pigovian taxes and no other regulation, the monopolist has no incentive to employ any resources in additional abatement (such as installation of filters) which would compensate for the lack of tax reimbursement. 6D. Water Demand

ASSURING ADEQUATE SUPPLY: QUANTITY AND QUALITY,
Nebraska State Dept. of Health, Lincoln. Div. of Environmental Engineering.
C. L. Summers.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska on November 4-5, 1976. p 55-60.

Descriptors: *Rural areas, *Water supply, *Water quality, *Potable water, *Water demand, Costs, Water supply development, Domestic water, Regulations, Water users, Water utilization, Water requirements, Consumptive use, Public health, Economics, Reliability, Safe Drinking Water Act, Groundwater, Cost-benefit analysis, Benefits, Wells.

Parameters for determining adequate water supply include water user needs, safety and health protection, reliability, and economic capability. User requirements vary 30-800 gal/d for per capita use in individual households. If groundwater resources are totally reserved for domestic use, sufficient quantities are available. Large withdrawals for industry, irrigation, and heavily populated areas reduce water resource accessibility for individuals. Natural groundwater filtering effectively removes bacteria and other microorganisms. Water quality often diminishes with well construction and installation methods. Nitrate nitrogen concentrations above 10 mg/l are associated with bacterial contamination. Assuring drinking water quality for individual water supply systems can be complex and costly, especially to comply with primary contaminant levels. The Safe Water Drinking Act of 1974 has significant social and economic implications. Mandating safe drinking water from private wells, beyond biological and nitrate parameters, requires large expenditures for enforcement while benefits are difficult to measure. In communities smaller than 100 population with a small water system, annual capital and operating costs for safe drinking water are expected to increase household monthly water bills $3-23. As governmental control extends to small community and individual household systems, the benefit-cost approach or cost-effectiveness must be defined and presented, in an acceptable manner to consumers. EXECUTIVE SUMMARY: WORKSHOPS ON TECHNOLOGICAL ASPECTS,
Cornell Univ., Ithaca, NY. Dept. of Agricultural Engineering,
W. J. Jewell.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply, and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska on November 4-5, 1976. p 111-117. 5 Ref.

Descriptors: *Conferences, *Water supply, *Rural area, *Research priorities, Governments, Political aspects, Water demand, Nitrates, Water pollution, Standards, Water rights, Nebraska, Social aspects, Water pollution control, Technology, Economic impact, Future planning(Projected), Groundwater, Safe Water Drinking Act, Sewage sludge, Sewage disposal, Education.

This paper reviews progress in rural water systems, summarizes workshop activities and suggests topics for additional research. Rural water problems are now given greater attention by private groups as well as governmental agencies. Political entities of rural water districts and natural resource districts significantly increase capabilities to deal with rural environmental quality problems. Since Nebraska and its neighboring states were experiencing a serious drought, this was discussed almost exclusively in workshops. Conference workshop conclusions are divided into water supplies and needs, and wastewater control. A common problem is anticipating growth and future water supply demands. The primary water quality concern is contamination with nitrates. Drinking water standards need to be enforceable and easily understood. A better working definition of 'right to water' is need to guide rural water program implementation. Preventing nitrate entry to groundwater and septic tank pollution control were also discussed. One important rural water research need is to define more clearly relationships between technical-social-economic issues and to relate these to resource development and utilization. Widespread education programs are needed to support the Safe Water Drinking Act. Several key technological alternatives for pollution control are needed, most importantly for nitrate removal from drinking water. Little is also known about effects of private usage of sewage sludge for ultimate disposal. (See also W78-11244) (Danovich-Wisconsin)

6E. Water Law and Institutions

LEGAL RIGHTS TO SEWAGE EFFLUENT,
D. Sliz, and S. Powell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139603, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona, Tucson. Project Completion Report, October 15, 1979. 76 p, 196 Ref. OWRT A-090-ARIZ(1).

Descriptors: *Water reuse, *Reclaimed water, *Arizona, *Sewage effluents, Sewage districts, Water users, Water rights, Legal aspects, Water shortage, Groundwater recharge, Aquifers, Legislation, Groundwater mining, Sewage, Water management(Applied), Potential water supply.

The legal aspects of waste water recapture or reuse are examined for the Tucson, Arizona, area, however, the legal problems examined are not limited exclusively to this area. The sole source of water supply for Tucson is pumped groundwater from the alluvial basin of an intermittent stream, the Santa Cruz. Due to the limited water resources of the area problems over the legal rights of the city and county to control sewage effluent from the city have developed. In the past treated effluent was discharged into the Santa Cruz stream bed for recharge of the aquifer. The city now plans to recapture and reuse or exchange the effluent. However, Pima County has contracted with an irrigation district to sell treated effluent from the Ina Road plant which is located in the county but treats city waste water. The city of Tucson has filed a complaint to prevent the county control of effluent originating in the municipal system. There are also other actual and potential conflicts over disposition and use of effluent. Case law and selected statutes which currently govern recapture are analyzed and the right of the city to use and to reuse water pumped from the Santa Cruz basin is examined. It is concluded that sewage effluent rights need to be defined or clarified by statute. Recommendations of appropriate legislation are provided. (Seigler-IPA)

CONTROLLING LAND USE FOR WATER MANAGEMENT AND URBAN GROWTH MANAGEMENT: A POLICY ANALYSIS,
California Univ., Davis.
S. I. Schwartz, R. A. Johnston, J. R. Blackmarr, and D. E. Hansen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139538, Price codes: A05 in paper copy, A01 in microfiche. California Water Resources Center, University of California, Davis, Contribution 180, December 1979, 80 p, (California Water Resources Center Project UCAL-WRC-W-487).

Descriptors: *Land use, *Water resources, *Control, *Urbanization, Planning, *Political constraints, Constraints, Political aspects, Taxes, Zoning, Economics, Water resources development.

This study reviews 18 land use control measures for application in water resources and urban growth management. The measures are carefully described and the evaluation literature is reviewed. An evaluation process and framework are then proposed. Existing evaluation methods were found deficient with respect to the requirements of this particular situation therefore a new method is proposed that is based in part on Etzioni's mixed scanning approach and utilizes a two stage evalua-

tion. The first stage consists of an initial scan which examines potential effectiveness and feasibility and identifies the most promising alternatives. The second stage involves a more detailed analysis which focuses on other impacts as well as feasibility and effectiveness criteria. The emphasis on constraints to implementation, especially political, is a feature that other evaluation methods neglect. The assessment of political feasibility is based on an analysis of the probable response of several interest groups to the perceived outcomes of each of the land use control measures. (Snyder-Cal)
W80-03077

AN ASSESSMENT OF THE ON-SITE WASTE WATER MANAGEMENT PROGRAM IN THE STATE OF MAINE,
Maine Univ. at Orono.
J. D. Davis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139579, Price codes: A08 in paper copy, A01 in microfiche. MS thesis May 1979. 162 p, 3 Fig, 25 Tab, 55 Ref, 5 Append, OWRT A-046-ME(1).

Descriptors: *Maine, *Waste water treatment, *Land use, *Regulation, Legal aspects, Plumbing, Inspections, Surveys, Administration, Management, Water policy, Municipal wastes, Waste disposal, Water pollution.

On-site waste water management proggram applications of the Maine Plumbing Code were studied to clarify the relationship between plumbing regulations and land use activity and to determine the perspective of the local plumbing inspector. State and local approaches to on-site waste water management programs administration and regulation were also studied. Results of a telephone survey of local plumbing inspectors were used to determine the role of the local inspector in Plumbing Code implementation. The Plumbing Code is widely accepted and meets local community needs 90% of the time. However, many communities are relying too heavily on the Code and are using it as a land use regulatory device. Maine's on-site waste water management program could be improved by providing additional local inspector training in the areas of land use and regulatory techniques along with more technical training in waste water disposal. Also, the reimbursement policies for local inspectors needs to be upgraded due to the technical aspects of the position. Other improvements are needed in the areas of funding, legal assistance, and municipal support for the inspectors. The Plumbing Code should be more formally linked to the Building Code and should involve contractors to insure the proper installation of disposal systems. Maine continues to have an on-site rather than a centralized approach to waste water treatment. (Seigler-IPA)
W80-03083

THE POLITICS OF IRRIGATION: AN EMPIRICAL TEST OF DEMOCRACY IN GREAT PLAINS RESOURCE DISTRICTS,
Kansas Univ., Lawrence. Dept. of Political Science.
C. G. Heatwole.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-139587, Price codes: A18 in paper copy, A01 in microfiche. Doctoral dissertation, May 1979, Volumes I and II, 406 p, 36 Fig, 68 Tab, 208 Ref, 2 Append, OWRT B-046-KAN(1).

Descriptors: *Political aspects, *Local governments, *Irrigation districts, *Groundwater mining, Texas, New Mexico, Kansas, Nebraska, Colorado, Great Plains, Governments, Water policy, Agriculture, Decisionmaking, Administration, Democracy, Grass roots.

Resource districts in the Great Plains states of Texas, New Mexico, Kansas, Nebraska, and Colorado are examined as examples of a decentralized form of government and how this decentralization effects democracy. Presumably these decentralized units of government provide the conditions, participation, responsiveness, and accountability, needed for realizing the democratic ideal. Resource districts were formed in many Great Plains states to deal with the serious natural resource problem of groundwater mining. The irrigation based economy of the Great Plains has forced farmers to maximize production regardless of prices or ecological concerns. Using these resource districts the claims for and against grass roots structures are analyzed. These special districts are described in detail including their history, types, numbers, functions, and structure. Highly autonomous and functionally general districts are emphasized. Optimistic and pessimistic views are given for the districts in terms of responsiveness, accountability, and participation. Mixed results fail to wholly substantiate either viewpoint. The 'democratic theory' is not borne out by the study results. (Seigler-IPA)

TOWARD A NATIONAL PROGRAM FOR RURAL WATER-SEWER DEVELOPMENT: THE BASIC ISSUES,
National Demonstration Water Project, Washington, DC.
S. Zimmerman.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln, Nebraska on November 4-5, 1976. p 15-26.

Descriptors: *Governments, *Sewerage, *Water supply development, *Rural areas, *State governments, Federal governments, Local governments, Regulation, Governmental interrelations, Water supply, Water conveyance, Community development, Domestic water, Potable water, Water quality, Government finance, Costs, Financing.

State governments must take a stronger stance than they have in the past in regard to rural water development. Although many agencies deal with only one area (health standards, rates, financing, or planning), interrelatedness must be recognized to correct past problems. As many as 30 million people do not have adequate domestic water or wastewater disposal facilities. Need is greater in the southeastern U.S. although it exists in virtually all parts of the country. Rural residents need adequate water-sewer facilities at rates they can afford. For water-sewer development to occur, local attitudinal factors must be considered and significant community groups identified. The federal government finances and regulates rural water and sewer development through the U.S. Department of Agriculture's Farmers Home Administration and the U.S. Environmental Protection Agency. Federal agencies presently provide the bulk of outside financing local communities receive. Financial assistance programs for water systems are also sponsored by 16 states. Community water system supply design, operation and output are usually monitored by state health departments. State coordinated programs for rural water-sewer development should include: local level development with state assistance; financing from all government levels with federal funds channeled through state governments; and state regulations operating under federal guidelines. RURAL WATER: STATE-FEDERAL RELATIONSHIPS,
North Dakota State Senator, Solen.
F. Barth.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal, Proceedings of a Conference Held at Lincoln, Nebraska on November 4-5, 1976. p 45-51.

Descriptors: *Federal government, *North Dakota, *Water supply development, *Rural areas, *Governmental interrelations, *Legislation, State governments, Water supply, Domestic water, Potable water, Costs, Water quality, Water resources development, Government finance, Political aspects, Inter-agency cooperation, Institutional constraints.

This paper discusses bills presently before the North Dakota legislature regarding rural water system projects and problems in coordinating state programs with federal agencies. Two draft bills approved by the Committee on Agriculture were introduced to the 1977 legislative assembly. The community water facilities loan act provides $10 million to supplement federal money for construction or improvement of community water facilities. The second bill relates to community water facility grants. Grants may not exceed $250,000 or 10% of total project costs; $5 million is to be appropriated. These two bills enhance prospects for better coordination between state programs and federal agencies. The federal Farmers Home Administration program is one of the best which meets rural citizen's needs; however certain agricultural states such as North Dakota receive insufficient grants. Demonstrating economic feasibility for each system in rural areas is difficult. North Dakota has close liasion capacity with the Bureau of Reclamation which provides financial and engineering assistance for community and rural water systems. The Apple Creek Diversion takes water from the Missouri River and supplies three counties with domestic and irrigation water. Better coordination is presently needed with federal agencies such as Housing and Urban Development, Environmental Protection Agency, and Economic Development Assistance Program. LEGAL PROBLEMS FACING RURAL DOMESTIC WATER USERS,
Nebraska Univ., Lincoln. Dept. of Agricultural Economics.
J. D. Aiken.
In: Water Problems in the Rural Environment; Alternative Solutions for Water Supply and Wastewater Disposal. Proceedings of a Conference Held at Lincoln Nebraska on November 4-5, 1976. p 101-106.

Descriptors: *Rural areas, *Water law, *Water rights, *Nebraska, Preferences(Water rights), Water supply, Wells, Nitrates, Water pollution sources, Fertilizers, Irrigation, Domestic water, Regulation, Priorities, Prior appropriation, Agriculture, Municipal water, Irrigation water, Industrial water, Judicial decisions.

This paper focuses on Nebraska Law and three rural water user issues: (1) water for municipalities and industry, (2) rural domestic water rights, and (3) nitrate pollution of groundwater supplies. Need for more governmental water regulation is suggested. In western states which follow appropriation rights, disputes among surface water users are resolved by the priority system. An exception to priority is the preference system which settles disputes among different war user classes. Typically, priority is given to domestic, then agriculture, and finally to industrial users. A problem frequently encountered is that municipal use is not recognized or if a municipality gives water to an industry, it's status as a domestic user is threatened. Another problem with the appropriation doctrine is that instream water uses, such as stockwatering, are not recognized. Conflicts with ranchers and irrigators have arisen and Nebraskan courts affirmed stockwatering as a domestic water use over irrigation. Conflicts have also arisen in Nebraska over loss of artesian pressure. In court cases, irrigators who pumped large water amounts and lowered the water table were liable for the loss of pressure to domestic well users. Nitrate groundwater pollution is increasing due to increased irrigation development. Excessive nitrates cause infant cyanosis and adversely affect plant and animal growth. Control strategies include restricting amounts of fertilizer used by farmers or amounts of water used in irrigation. (See also W78-11244) (Danovich-Wisconsin)

THE ECONOMICS OF THE EASTERN BLOCK OCEAN POLICY,
Washington Univ., Seattle. Inst. for Marine Studies.
V. Kaczynski.
American Economic Review, Vol 69, No 2, p 261-265, 1979. 1 Fig, 1 Tab, 13 Ref.

Descriptors: *Marine fisheries, *Economics, *Fish harvest, *Socialist countries, Oceans, 200-mile economic zone, Costs, Economic efficiency, Commercial fishing, Fishing fleets, Poland, East Germany, Soviet Union, Bulgaria, Rumania, Fuel.

The development of marine fisheries of the Eastern bloc countries is analyzed. Recent trends in use of ocean resources by socialist countries show that: (1) During the first half of the 1970s, they rapidly increased their share of the total world harvest of marine organisms. (2) The rate of growth of the catch volume was many times higher than that registered during the same period by world fisheries. (3) Beginning in 1976 socialist fishing nations showed a sharp slowdown in the rate of increase of their catch. A high degree of technological flexibility and adaptability, utilization of underutilized commercial species, well-developed maritime industries, particularly ship-building, and development of large factory trawlers are primarily responsible for this expansion. However, the magnitude of the Eastern ocean-going fleet reflects a massive investment and commitment to the exploitation of ocean fisheries. On the eve of widespread implementation of the 200-mile economic zone, 50-70% of their marine resources came from fishing grounds located 2000 to 9000 miles from their home ports with the most important of these under the jurisdiction of developed Western nations. Fuel consumption has been the single most important cost item in fleet operation presently constituting over 20% of total harvesting outlays. At the same time, legal limitations and depletion of the traditionally harvested species have reduced fishing opportunities. The current state of Eastern fisheries in which decreasing growth rates in catch are accompanied by disproportional increases in costs of ocean fisheries, has become a heavy economic burden for socialist governments. 200-MILE ECONOMIC ZONES -- FISHING LIMITS AND THE E.E.C.,
Carlton Univ., Ottawa (Ontario).
J. I. Prattis.
Maritime Policy and Management, Vol 5, No 4, p 327-331, 1978.

Descriptors: *200-mile economic zones, *International waters, *Jurisdiction, *Economic impact, *Fisheries, *Law of the Sea, Economic justification, E.E.C, Governments, International commissions, International law, Regulation, Atlantic Ocean, Permits, Political aspects, Foreign waters, Commercial fishing, Legal aspects, Oceans.

International effects of 200-mile offshore fishing and economic exploitation zones by coastal nations are discussed. Factors underlying the unilateral declaration of these 200-mile zones by many nations in January 1977 (following Iceland's historic examples in 1975) include: (1) general ineffectiveness of various international commissions concerned with conservation of fish stocks; (2) failure of various UN conferences on the Law of the Sea to arrive at any kind of consensus on international fishing limits; (3) rapid depletion of fish stocks on which certain countries depend for a major share of their gross national product. Problems created by this new policy have forced the E.E.C. to formulate an external fisheries policy and an internal fisheries system. The external fisheries policy is primarily concerned with phasing out of third-country fishing in E.E.C. waters, controlling access to the E.E.C. 200-mile zone by licenses, and securing reciprocal agreements to fish in third-country economic zones. The internal fisheries policy is concerned with harmonization of the E.E.C. fishing industry and this area of policy has caused considerable conflict between member states of the Common Market. Problems of the new policy include: (1) There is a danger that harmonization and regularization of the entire E.E.C. community fishing industry may be to the detriment of particular coastal areas entirely dependent on fishing. (2) Conflict in policy preferences with E.E.C. prevents negotiation of multilateral fishing agreements and create an air of uncertainty, a constraint on planning and investment in the industry. DROUGHT AND MIGRATION: THE LAKE MALAWI LITTORAL AS A REGION OF REFUGE,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of African History.
J. B. Webster.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 148-157, 1979. 2 Fig, 20 Ref.

Descriptors: *Droughts, *Migration patterns, *Populations, Africa, Climatology, Distribution patterns, Spatial distribution.

The history of migrations into the Lake Malawi littoral is surveyed and coordinated where possible with known or suspected droughts in Central Africa. Nile levels, tree rings, documentation, and oral history moving chronologically backward beginning in the late 18th century and ending about 1285, are used in support of the postulation that the Lake Malawi littoral was seldom subjected to drought severe enough to force people to emigrate therefrom, but that Central Africa has witnessed droughts of such lengths and intensity that numerous peoples have been compelled to migrate into the area for survival. Although it is not suggested that drought was the only causal factor in the displacement of people, this paper clearly demonstrates the cause and effect relationship between climate and migration over 500 years of African history. UTILIZATION OF MUNICIPAL SEWAGE EFFLUENT AND SLUDGE ON FOREST AND DISTURBED LAND.
Proceedings of Symposium held in Philadelphia, PA, March 21-23, 1977. Edited by Sopper, W. E. and Kerr, S. N., 1979. 547 p. Pennsylvania State University Press, University Park. OWRT A-999-PA(6).

Descriptors: *Sewage effluents, *Irrigation effects, *Vegetation establishment, *Wildlife habitats, Forest management, Litter, Revegetation, Coal mine wastes, Vegetation effects, Ecology, Food chains, Chemical analysis, Soil physical properties, Infiltration, Microbiology, Public health, *Land application, *Wastewater disposal.

Text of forty-four papers presented at the symposium in Philadelphia is given. The papers review current knowledge related to the economic and environmental feasibility of applying treated municipal sewage effluent and sludge to promote forest land production and to rehabilitate disturbed surface mining areas. The current surge of interest in land application of treated waste water and sludge is stimulated by the energy crisis, increasing scarcity of mineral resources, the rising costs of commercial fertilizer, and new pollution and reclamation regulations. Seven topic areas covered under waste water and sludge application are: water quality and renovation, microbiological aspects, vegetation responses, forest soils, other ecosystem responses, public health, and system design and economics. Five areas covered under disturbed land revegetation are: sludge application methods, water quality and vegetation responses, microbiology and public health, domestic animals and wildlife, and guidelines and regulations. EFFECT OF SPRAY IRRIGATION OF TREATED MUNICIPAL SEWAGE EFFLUENT ON THE ACCUMULATION AND DECOMPOSITION OF THE FOREST FLOOR,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
J. L. Richenderfer, and W. E. Sopper.
In: Utilization of Municipal Sewage Effluent and Sludge on Forest and Disturbed Land, p 163-177, 1979. 12 Tab, 19 Ref. OWRT-C-5169(4205)(3).

Descriptors: *Forest management, *Humus, *Irrigation effects, *Sewage effluents, Forestry, Erosion, Pine trees, Conifers, Hardwood, Deciduous trees, Decomposing organic matter, Degradation(Decomposition), Sludge disposal, Nitrogen, Litter, Leaves, *Land application, *Wastewater disposal, *Spray irrigation.

Treated municipal sewage effluent from a Pennsylvania State University treatment plant was used to study the effect of effluent spray irrigation on forest floor accumulation and decomposition in two forested areas, a mixed-hardwood stand and a red pine plantation. Irrigated and control plots of 0.20 ha were located in each forest area and waste water was applied weekly from 1963 to 1975. Application amounts varied from 2.5 cm/week to 3.8 cm/week applied over single four hour periods. In each plot, both irrigated and control, the following were measured: (1) depths and amounts of forest floors, (2) amounts of annual litter fall, (3) forest floor decomposition rates, and (4) environment and chemical factors affecting decomposition rates such as moisture, temperature, and carbon/nitrogen litter ratios. Results show that irrigation of effluent significantly reduced depth and amount of forest floor in both forests, however, there was no significant effect on annual litter fall amounts. The observed forest floor reductions were caused by increased decomposition rates resulting from increased moisture content, temperature, and higher total nitrogen levels caused by the effluent irrigation. The red pine irrigated plot had a 66% reduction in depth while the hardwood plot had a larger loss at 77%. This loss of forest floor cover could ultimately affect the physical and hydrologic properties of the soil due to increased exposure to raindrop impact which in turn would affect infiltration capacity resulting in increased overland flow and erosion. W80-03090

EFFECT OF MUNICIPAL WASTEWATER IRRIGATION ON THE PHYSICAL PROPERTIES OF THE SOIL,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
W. E. Sopper, and J. L. Richenderfer.
In: Utilization of Municipal Sewage Effluent and Sludge on Forest and Disturbed Land, p 179-195, 1979. 20 Tab, 1 Ref. OWRT-C-5169(4205)(4).

Descriptors: *Irrigation effects, *Sewage effluents, *Soil physical properties, *Porosity, *Infiltration, Soil stability, Capillary action, Drainage effects, Percolation, Permeability, Soil classification, Soil water movement, Irrigation practices, Irrigation water, *Land application, *Spray irrigation.

Two soil types at sites near Pennsylvania State University were used to study the effect of waste water irrigation on the infiltration and percolation capacities of the soils. One soil type, Hublersburg silt loam has a silt loam topsoil with silty clay or clay subsoil giving moderate to moderately rapid permeability. The other soil type is in the Morrison and Gatesburg series with moderately rapid to very rapid permeability. Study areas were used representing six vegetative cover types, a reed canarygrass area, a corn field, an old field area, a mixed hardwood forest area, and a red pine plantation. In a each area there were 0.20 ha control and treatment plots getting weekly applications of sewage effluent. Measurements were taken in the treated and control plots for infiltration capacities using a double-ring infiltrometer and an Alderfer-Robinson-type infiltrometer; percolation capacity; total capillary and noncapillary porosities; bulk density; water stability index of soil aggregates; and root mass content. Results show that spray irrigation of effluent significantly reduced infiltration capacities in the Hublersburg silt loam in both forested areas and in the reed canarygrass area while increasing infiltration in the corn area. Percolation capacities were not significantly affected in the agricultural or forested soils, however, percolation capacities were reduced on all effluent irrigated areas in the agronomy and old field plots. Total or capillary porosities and bulk density were not significantly affected. Agricultural and old field areas experienced reduced water stability and both agricultural areas had lower root masses in treated plots. (See also W80-03089) (Seigler-IPA)
W80-03091

EFFECTS OF MUNICIPAL WASTEWATER IRRIGATION ON WILDLIFE AND WILDLIFE HABITAT,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
R. G. Anthony, and G. W. Wood.
In: Utilization of Municipal Sewage Effluent and Sludge on Forest and Disturbed Land, p 213-223, 1979. 2 Fig, 11 Tab, 8 Ref. OWRT B-059-PA(6), B-084-PA(5).

Descriptors: *Irrigation effects, *Sewage effluents, *Wildlife habitats, *Wildlife, *Vegetation effects, Deer, Song birds, Birds, Ecology, Food chains, Oak trees, Pine trees, Vascular tissues, Shrubs, Brush, Browse utilization, Plant groups, *Spray irrigation, *Land application.

Mixed oak and aspen/pine/shrub habitats were used to study the effects of waste water irrigation on vegetation and wildlife at the Pennsylvania State University Wastewater Renovation System. Results show that waste water irrigation effects are dependent on the type of habitat irrigated and the species of wildlife studied. Various animals and habitats were studied including white-tailed deer, white-footed mice, cottontail rabbits, and songbirds. Waste water irrigation on mixed oak habitats caused the establishment of lush herbaceous growth such as pokeweed which is unpalatable to deer. Suitable woody forage was reduced in the irrigated mixed-oak habitats due to ice breakage in winter and increased herbaceous competition in the summer. However, for brush and sapling stands an increase of woody forage plants would be expected due to increased sprouting from the ice breakage. Irrigation resulted in higher populations of white-footed mice in fall but not in spring, most probably because the increased food from herbaceous growth in summer disappeared in winter. Reduced stability and abundance of songbird populations was observed for irrigated areas. Also songbirds avoided irrigated areas during actual irrigation. For aspen/pine/shrub habitats these observed detrimental effects appear to be less severe than in the mixed oak habitats. A short-term study of heavy metals showed that they were not accumulated in cottontail rabbits or white-footed mice inhabiting irrigated areas. Overall no major detrimental effects on wildlife and habitats were observed due to irrigation. (See also W80-03089) (Seigler-IPA)

Descriptors: *Soil moisture, Thermography, Thermal prospecting, Groundwater, Soil temperature, *Moisture content, Forecasting, Model studies, *Heat transfer.

Experimental and theoretical investigations were carried out relating to the detection and mapping of soil moisture by the use of remote sensed thermal emittance data (thermography). Soil temperature profiles, thermal emittance, soil moisture and other pertinent data were collected for test plots under fallow and crop cover conditions. Data were always collected simultaneously for two plots with identical surface conditions but one of the plots irrigated to create different soil moisture profiles. Calculations of surface temperature difference as a function of time for these soil moisture conditions were made utilizing a theoretical model. The functional form of the theoretical temperature difference with time were shown to be very close to the experimental apparent temperature difference for both crop cover and bare soil conditions. This result strongly suggests that a technique can be developed by which the effects of near surface soil moisture can be separated from the total thermal emittance data by subtracting the data component having this functional form from total thermal emittance. This component could then be used to calculate soil moisture differences for group of chosen sites. If soil moisture is measured at one site, soil moisture may be calculated for the other sites. The general nature of additional parameters needed for the present model are also described. (Wiersma-SDAK)

WATER RESOURCES DATA FOR COLORADO, WATER YEAR 1978--VOLUME 1. MISSOURI RIVER BASIN, ARKANSAS RIVER BASIN, AND RIO GRANDE BASIN.
Geological Survey, Lakewood, CO. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-119944, Price codes: A19 in paper copy, A01 in microfiche. Geological Survey Water-Data Report CO-78-1, August 1979. 415 p, 4 Fig, 4 Tab, 40 Ref.

Descriptors: *Colorado, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Missouri River basin(CO), *Arkansas River basin(CO), *Rio Grande basin(CO).

Water-resources data for Colorado for the 1978 water year consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of wells and springs. This report (Volumes 1, 2, and 3) contains discharge records for about 440 gaging stations; stage and contents of 25 lakes and reservoirs, 5 partial-record flow stations, 75 crest-stage partial-record stations, and 250 miscellaneous sites; water quality for 140 gaging stations and 60 miscellaneous sites; and water levels for 55 observations wells. A few pertinent stations in bordering States are also included in this report. These data represent that portion of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Colorado. (Kosco-USGS)

QUALITY OF RIVERS OF THE UNITED STATES, 1975 WATER YEAR--BASED ON THE NATIONAL STREAM QUALITY ACCOUNTING NETWORK (NASQAN),
Geological Survey, Reston, VA. Water Resources Div.
J. C. Briggs, and J. F. Ficke.
Geological Survey open-file report 78-200, May 1977. 436 p, 25 Fig, 14 Tab, 25 Ref.

Descriptors: *Water quality, *Rivers, *United States, *Networks, *Data collections, *Streams, Water temperature, Chemical analysis, Dissolved solids, Sedimentation, Geology, Precipitation(Atmospheric), Water pollution, Nutrients, Specific conductivity, Nitrogen, Phosphorus, Plant populations, Bacteria, Heavy metals, Phytoplankton, Periphyton, Carbon, Radioactivity, Hardness(Water), Biota, Pesticides, Trace elements, Soils, Agriculture, *NASQAN.

The National Stream Quality Accounting Network (NASQAN) was established by the U.S. Geological Survey to provide a nationally uniform basis for continuously assessing the quality of U.S. rivers. Stations generally are at the downstream end of hydrologic accounting units in order to measure the quantity and quality of water flowing from the units. Data are available on a large number of water-quality constituents measured at 345 stations during the 1975 water year. Temperature data (usually continuous or daily measurements) from NASQAN stations were fitted to a first order harmonic equation and the parameters for the harmonic function are reported for each station. Considering chemical and biological characteristics of U.S. streams as described by NASQAN data, water quality is best (by many standards) in the Northeast, Southeast, and Northwest. Many of these waters show the effects of pollution and carry moderate or high levels of major nutrients. High counts of indicator bacteria also show signs of local pollution. In the Northeast, some heavy metals are at moderate levels, but not above most water-quality criteria. Rivers of most of the Mid-Continent and Southwest reflect the arid or semi-arid climate, erodible soils, and agricultural activities. A special analysis was made to study the patterns of dissolved solids, major nutrients, phytoplankton, and zinc in the Mississippi River above Memphis, Tennessee. (Kosco-USGS)

WATER-RESOURCES DATA, 1970-75, FOR PERRIS VALLEY AND VICINITY, RIVERSIDE COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
D. J. Lang.
Available from OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225. Printed copy $17.25, microfiche $3.50. Geological Survey open-file report 79-1256, August 1979. 127 p, 8 Fig, 6 Tab, 19 Ref.

Descriptors: *Water resources, *Hydrologic data, *Investigations, *Data collections, Rural areas, Land use, Urbanization, Peak discharge, Precipitation(Atmospheric), Groundwater, Water levels, Water quality, Sediment yield, Storm runoff, Climates, Streamflow, Surface waters, Crest-stage gages, Flood stages, Gaging stations, Rainfall-runoff relationships, Water wells, California, *Perris Valley(CA), *Riverside County(CA).

In 1969 the U.S. Geological Survey began in Perris Valley, Calif., to determine changes in the hydrologic regime as a rural area becomes urbanized. The investigations spanned several years when precipitation was below normal in most of southern California. Surface-water records were collected for a 6-year period at 21 sites, and continuous precipitation records were obtained at four sites. Ground-water levels were tabulated from historical data at selected wells for 1941, 1968, and 1970. Water quality was monitored at several wells in the valley, and sediment data were collected at three surface-water gages. There was little increase in urbanization during the investigation. OCCURRENCE, QUALITY, AND QUANTITY OF GROUND WATER IN WILBARGER COUNTY, TEXAS,
Texas Dept. of Water Resources, Austin.
R. D. Price.
Report 240, November 1979. 241 p, 34 Fig, 11 Tab, 57 Ref.

Descriptors: *Groundwater, *Data collections, *Texas, *Water quality, *Aquifers, Groundwater

availability, Water supply, Aquifer characteristics, Water table, Water levels, Well data, Test wells, Drillers logs, Hydrogeology, Water properties, Chemical analysis, Dissolved solids, Hardness(Water), Chlorides, Iron, Nitrates, Transmissivity, Aquifer systems, Geology, Boron, Precipitation(Atmospheric), Evaporation, Brine disposal, Springs, *Wilbarger County(TX).

Wilbarger County, 954 square miles in area, is located in extreme northcentral Texas and entirely within the Osage section of the Central Lowlands physiographic province. The area lies within the Red River drainage basin with the Red River forming its north boundary and the Pease River dissecting the county and flowing northeast through the central part of the county. The water-bearing units listed in their order of importance are: the Seymour Formation, Quaternary alluvium deposits, and the rocks of the Permian System. The Seymour Formation and Quaternary alluvium deposits are hydrologically connected and usually function as a single aquifer. The yields of the wells range from small to moderate. The quality of their groundwaters ranges from fresh to very saline. Groundwaters of the Clear Fork Group of Permian age are of small yields and are usually highly mineralized. The San Angelo Formation of Permian age reliably yields fresh to slightly saline groundwater in small quantities. Groundwater in Wilbarger County is used for municipal, irrigation, rural domestic, livestock, and industrial purposes. The native groundwater in the principal aquifer in the county, although very hard, is of good quality. Water from this aquifer is suitable for public supplies, irrigation, livestock, and limited industrial uses. (Humphreys-ISWS)

ARMOUR UNIT FOR WAVE ENERGY ABSORPTION,
C. T. Brown.
U.S. Patent No 4,172,680, 10 p, 23 Fig, 9 Ref; Official Gazette of the United States Patent Office, Vol 987, No 5, p 1179-1180, October 30, 1979.

Descriptors: *Patents, *Breakwaters, *Barriers, Coastal structures, Shore protection, Concrete structures, Waves(Water).

A breakwater, or similar structure, is comprised of a core of rubble, and an armouring layer overlying the core. The armouring layer is composed of individual armour units of hexagonal outer cross-section arranged in a honeycomb array. Each of the armour units has an elongated, concrete body with longitudinal through water-passage means so that the porosity of the exposed face of the armouring layer is solely determined by the ratio of the cross-sectional area of the water passage means to the cross-sectional area of the concrete body. SLURRY FLOW IN PIPE NETWORKS,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
D. J. Wood.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15132, p 57-70, January 1980. 3 Fig, 3 Tab, 5 Ref, 2 Append.

Descriptors: *Hydraulic transportation, *Slurries, *Pipelines, Networks, Network design, Pipe flow, Steady flow, Hydraulics, Computer programs, Equations, *Two-phase flow, Coal transportation.

The basic equations for steady-state flow of a solid-liquid slurry in a network of pipes were developed. The equations were expressed in terms of unknown flow rates and solids concentrations for each pipe in the network. Two sets of simultaneous algebraic equations were obtained. These are nonlinear, and a direct solution of the equation sets is not possible. A procedure for solving the equations based on linearization of nonlinear terms was described. This procedure requires several trials and converges rapidly. A computer program was developed based on the proposed method and an example system was analyzed using this program, and the results were presented. (Lee-ISWS)

EXTENDED SET OF COMPONENTS IN PIPE NETWORKS,
Waterloo Univ. (Ontario). Dept. of Systems Design.
M. Chandrashekar.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15130, p 133-149, January 1980. 11 Fig, 6 Tab, 7 Ref.

Descriptors: *Networks, *Network design, *Water distribution(Applied), Economic efficiency, Economic justification, Graphical analysis, Pipe flow, Pumps, Valves, Computer programs, Equations, *Check valves, Economic analysis, Matrix methods, Pressure reduction, Sparse matrix method.

Models for an extended set of components encountered in water-distribution systems were developed based on graph theoretic concepts. It is shown that components such as check valves, pressure-reducing valves, and booster pumps may be included in the system of equations in which junction (nodal) heads are being solved by selecting appropriate admittance values (similar to those associated with simple pipes) indicated by the current operating conditions of the valves. The formulation-solution procedure is based on sparse matrix methods that leads to efficient and economical analysis of water-distribution systems on a digital computer. (Lee-ISWS)

Descriptors: *Permeability, *Pennsylvania, Flow, Laboratories, *Soils, Sites, Design, *Sewage disposal, *Septic tanks, *Construction, *Maintenance, Chemical analysis, Infiltration, Effluents, Adsorption, Percolation, *Elevated sand mounds, *Renovation, Fill materials, *Questionnaire, *Malfunction rates, Column studies, Pressurized distribution, Sand-clay mixtures, On-site disposal.

Elevated sand mounds were introduced in 1974 and are currently widely used in Pennsylvania for on-site domestic waste disposal. This report describes the project undertaken to assess the effectiveness of the systems and to determine the varied conditions under which the systems succeed or fail. Data from questionnaire and field studies indicated that a considerable number of elevated mound systems are malfunctioning throughout Pennsylvania. The rate of malfunction varied regionally and was related to placement of systems on unsuitable sites, construction problems, and to unsuitable soil and site characteristics not defined in the regulations. In some areas, the designed lateral-plus-vertical flow capabilities were insufficient to dissipate the effluent resulting in malfunctions on sites found suitable under current regulations. Laboratory studies indicated that with sufficient effluent dissipation, adequate renovation should occur within and beneath the mound systems. Column studies showed that the presence of clay in quantities currently meeting PDER standards in a sandy fill did not significantly improve the renovation of septic tank effluent. Siting, design, construction and maintenance recommendations were made for Pennsylvania elevated sand mounds. Many of these recommendations are currently being implemented into the latest revisions of the on-site domestic waste disposal standards of the Department of Environmental Resources.

NETWORKS AND INFORMATION SYSTEMS FOR DEALING WITH DROUGHT,
Clark Univ., Worcester, MA.
L. Berry, and R. B. Ford.
In: Proceedings Symposium on Drought in Botswana, June 5-8, 1978, Gaborone. Published by the Botswana Society in collaboration with Clark University Press. p 165-172, 1979. 2 Tab, 1 Ref.

Descriptors: *Droughts, *Information exchange, *Networks, Planning, Regional analysis, Botswana, Planning, Environment, Monitoring.

This paper outlines information important in dealing with drought as (1) western scientific information, (2) ethno-scientific information, and (3) know-how, or informal technical information. The difficulty of use of diverse sources of environmental information would seem to lie in the translation of a mass of even well-ordered and closely documented scientific information into specific development projects. The authors believe that Botswana is in a position of strength from three kinds of information: environmental, natural resource, and drought. Experience has already been gained there in the use of remote sensing for assessing the status of and monitoring change in national resources. Botswana's Tribal Grazing Lands Programme has demonstrated that in rural areas, local people understand

their local environment and keep track of changes within it. If experiments encouraging simple monitoring of key environmental components, perhaps through schools and/or the establishment of low-cost environmental/drought assessment units composed of part-time people from key ministries and institutions, a great step forward will have been taken toward the use of information in planning. A Fast Indicator for Detecting Gross Pollution by Hazardous Chemicals,
W80-03257 5A

CHEMICALS
The Volume-Averaged Mass-Transport Equation for Chemical Diagenetic Models,
W80-03044 5B

Relationships Between Stream Discharge and Yield of Dissolved Substances from a Colorado Mountain Watershed,
W80-03191 5B

CHLORDANE
Identification of Chlordanes and Related Compounds in Goby-Fish from Tokyo Bay,
W80-03290 5A

CHLORELLA
Accumulation of Cadmium by Green Microalgae,
W80-03276 5B

CHLORINATED HYDROCARBON PESTICIDE
Identification of Chlordanes and Related Compounds in Goby-Fish from Tokyo Bay,
W80-03290 5A

CHLORINATED HYDROCARBON PESTICIDES
Trace Metals and Organochlorine Residue Content of Mullidae Family Fishes and Sediments in the Vicinity of Erdemli (Icel), Turkey,
W80-03231 5A

Heavy Metals and Chlorinated Hydrocarbons in Pelagic Organisms from the Open Mediterranean Sea,
W80-03241 5A

Effects of p,p'-DDT, p,p'-DDD, and p,p'-DDE on Oxygen Uptake in the Freshwater Planarian (Phagogata Gracilis),
W80-03291 5A

CHLORINE
The Development of Water Quality Criteria for Ammonia and Total Residual Chlorine for the Protection of Aquatic Life in Two Johnson County, Kansas Streams,
W80-03082 5C

CHLOROPHOS
Effect of Chlorophos and Hexachlorane on Cell Cultures of Warm-Blooded and Cold-Blooded Animals,
W80-03242 5C

CHROMATOGRAPHY
Functionally Distinct Classes of Complex Phosphorus Compounds in Lake Water,
W80-03110 5C

CHROMIUM
Levels of Metal Pollutants in Sediments and Biota of the Gulf of Trieste: A Long Term Survey,
W80-03228 5A

Pollution Monitoring of Eleven Trace Elements in Three Marine Organisms from Saronikos Gulf, Greece,
W80-03230 5A

Accumulation and Distribution of Heavy Metals in Some Marine Organisms in the Bay of Izmir and in Aegean Coasts,
W80-03239 5A

Organochlorines and Metals in Harbour Seals (Dutch Wadden Sea),
W80-03280 5B

Concentrations of Arsenic, Selenium and Ten Heavy Metals in School Shark, Galeorhinus Australis (Macleay), and Gummy Shark, Mustelus Antarcticus Gunther, from South-Eastern Australian Waters,
W80-03285 5A

CICHLIDS
Sub-Lethal Effects of the Organophosphate Black Fly Larvicide, Abate (Temephos) on Sarotherodon Mossambicus (Peters),
W80-03261 5C

CITIES
A Model for Evaluating Runoff-Quality in Metropolitan Master Planning,
W80-03199 5B

CLAVA
Hydroids in Biotest: Clava Multicornis Exposed to Cadmium,
W80-03296 5A

CLAVIS
Toxic Effects and Accumulation of Cadmium in Some Benthic Organisms of the Baltic,
W80-03297 5A

CLIMATOLOGY
Kutse Game Reserve: Field Trip to a Drought-Prone Environment,
W80-03059 2A

CLOGGING
Soil Sediment Deposits in Subsurface Drains,
W80-03178 4A

COAL MINE WASTES
Sewage Effluent and Liquid Digested Sludge as Aids to Revegetation of Strip Mine Spoil and Anthracite Coal Refuse Banks,
W80-03093 3C

COASTS
Marine Wildlife Conservation in the Coastal Zone,
W80-03024 5C

COBALT
Levels of Metal Pollutants in Sediments and Biota of the Gulf of Trieste: A Long Term Survey,
W80-03228 5A

Trace Elements in Pelagic Organisms and a Pelagic Foodchain of the Aegean Sea,
W80-03229 5A

Pollution Monitoring of Eleven Trace Elements in Three Marine Organisms from Saronikos Gulf, Greece,
W80-03230 5A

Accumulation and Distribution of Heavy Metals in Some Marine Organisms in the Bay of Izmir and in Aegean Coasts,
W80-03239 5A

Concentrations of Arsenic, Selenium and Ten Heavy Metals in School Shark, Galeorhinus Australis (Macleay), and Gummy Shark, Mustelus Antarcticus Gunther, from South-Eastern Australian Waters,
W80-03285 5A

Heavy Metals in the Sediments of the Gulf of Bothnia,
W80-03295 5A

COD
Polycyclic Aromatic Hydrocarbon Carcinogens in Commercial Seafoods,
W80-03252 5A

COLCHICINE
Toxic Effects of the Phytoalkaloid Colchicine on Oviposition and Neurosecretion of the Vector Snail (Indoplanorbis Exustus),
W80-03289 5A

COLORADO
Water Resources Data for Colorado, Water Year 1978--Volume 1. Missouri River Basin, Arkansas River Basin, and Rio Grande Basin.
W80-03149 7C

Water Resources Data for Colorado, Water Year 1978--Volume 2. Colorado River Basin Above Dolores River.
W80-03150 7C

Water Resources Data for Colorado, Water Year 1978--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W80-03151 7C

Relationships Between Stream Discharge and Yield of Dissolved Substances from a Colorado Mountain Watershed,
W80-03191 5B

COLORADO RIVER
Winter Ice Jams on the Gunnison River,
W80-03100 2C

COLORADO RIVER BASIN
Ground-Water Salinity Problems Related to Irrigation in the Colorado River Basin,
W80-03189 5G

COLORADO RIVER BASIN ABOVE DOLORES RIVER
Water Resources Data for Colorado, Water Year 1978--Volume 2. Colorado River Basin Above Dolores River.
W80-03150 7C

COMMERCIAL FISH
Polycyclic Aromatic Hydrocarbon Carcinogens in Commercial Seafoods,
W80-03252 5A

COMMERCIAL FISH FEEDS
PCBs and DDE in Commercial Fish Feeds,
W80-03259 5A

COMMERCIAL SHELLFISH
Polycyclic Aromatic Hydrocarbon Carcinogens in Commercial Seafoods,
W80-03252 5A

COMPETITION
Monopoly-Power as a Means for Pollution-Control.
W80-03148 6C

COMPREHENSIVE PLANNING
Drought Susceptibility Survey and the Concept of Monitoring Landscape Ecology,
W80-03065 6B

An Aspect of Warning Systems for Drought: Information Collecting in the Districts,
W80-03073 6A

COMPUTER MODELS
Simulated Changes in Potentiometric Levels Resulting from Groundwater Development for Phosphate Mines, West-Central Florida,
W80-03040 2F

Urban Stormwater Control Package for Automated Real-Time Systems,
W80-03080 4A

Computer Simulation of Storm Surges and River Flooding in Mobile Bay,
W80-03088 2L

A Discrete Model for the Study of a Lake,
W80-03106 5C

COMPUTER PROGRAMS
Sorption of Water in Soils: A Comparison of Techniques for Solving the Diffusion Equation,
W80-03192 2G

CONFERENCES
Executive Summary: Workshops on Technological Aspects,
W80-03135 6D

Executive Summary: Workshops on Socio-Economic Aspects,
W80-03136 6C

CONSERVATION
Marine Wildlife Conservation in the Coastal Zone,
W80-03024 5C

CONSTRUCTION
Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

CONTINENTAL SHELF
A Variable-Depth Green's Function for Shelf Edge Tides,
W80-03030 2L

CONTINUOUS SYSTEM MODELING PROGRAM (CSMP)
Sorption of Water in Soils: A Comparison of Techniques for Solving the Diffusion Equation,
W80-03192 2G

CONTOURS
Potentiometric Surface of the Mississippian Aquifer in Parts of Trigg, Lyon, Caldwell, and Christian Counties, Mississippian Plateau Region, Kentucky,
W80-03155 2F

CONTROL
Controlling Land Use for Water Management and Urban Growth Management: A Policy Analysis,
W80-03077 6E

CONTROL SYSTEMS
Linear Move Irrigation System and Control Therefor,
W80-03196 3F

CONWY RIVER (WALES)
Zinc in the Conwy River and Estuary,
W80-03029 2L

COOLING WATER
Polyphosphate-Based Industrial Cooling Water Treatment,
W80-03139 5F

COOLING WATERS
Preliminary Results on Uptake and Elimination at Different Temperatures of p,p'-DDT and Two Chlorobiphenyls in Perch from Brackish Water,
W80-03268 5A

COPEPODS
Wax Esters in the Marine Environment: Origin and Composition of the Wax from Bute Inlet, British Columbia,
W80-03254 5A

COPPER
Levels of Metal Pollutants in Sediments and Biota of the Gulf of Trieste: A Long Term Survey,
W80-03228 5A

Trace Metals and Organochlorine Residue Content of Mullidae Family Fishes and Sediments in the Vicinity of Erdemli (Icel), Turkey,
W80-03231 5A

COPPER

Trace Elements in Mesopelagic and Some Coastal Fish from the Adriatic,
W80-03233 5A

Accumulation and Distribution of Heavy Metals in Some Marine Organisms in the Bay of Izmir and in Aegean Coasts,
W80-03239 5A

Heavy Metals (Hg, Cd, Cu, Pb, Zn) in Liver and Muscle Tissue of Fresh-Water Perch (Perca Fluviatilis) of the Lake of Biel and the Walensee (In German),
W80-03269 5A

Organochlorines and Metals in Harbour Seals (Dutch Wadden Sea),
W80-03280 5B

Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

Concentrations of Arsenic, Selenium and Ten Heavy Metals in School Shark, Galeorhinus Australis (Macleay), and Gummy Shark, Mustelus Antarcticus Gunther, from South-Eastern Australian Waters,
W80-03285 5A

Combined Effects of Cadmium, Copper and Lead on Developing Herring Eggs and Larvae,
W80-03286 5A

Heavy Metals in the Sediments of the Gulf of Bothnia,
W80-03295 5A

COREXIT
Effect of a Chemical Dispersant on Microbial Utilization of Petroleum Hydrocarbons,
W80-03216 5A

COST ALLOCATION
Comment on 'The Efficiency and Equity of Cost Allocation Methods for Multipurpose Water Projects' by James C. Loughlin,
W80-03137 6C

CRABS
Influence of Crude Oil and Detergents on the Concentration of some Ions in Hemolymph of the Shrimp Crangon Crangon L. and the Crab Rhithropanopeus Harrisi Gould,
W80-03277 5B

CRAZY EDDIE BOG (OH)
Functionally Distinct Classes of Complex Phosphorus Compounds in Lake Water,
W80-03110 5C

CRUDE OIL
Acute Aquatic Toxicity and Dispersing Effectiveness of Oil Spill Dispersants: Results of a Canadian Oil Dispersant Testing Program (1973 to 1977),
W80-03215 5A

Effect of a Chemical Dispersant on Microbial Utilization of Petroleum Hydrocarbons,
W80-03216 5A

Influence of Crude Oil and Detergents on the Concentration of some Ions in Hemolymph of the Shrimp Crangon Crangon L. and the Crab Rhithropanopeus Harrisi Gould,
W80-03277 5B

Effects of Crude Oil on the Development of the Shell of Mytilus edulis (L) (Mytilidae, Bivalvia), (In French),
W80-03284 5B

Review of Experiments on the Chronic Toxicity Exerted by Some Pollutants on Animal Species from the Bay of Gdansk,
W80-03298 5A

CRUSTACEANS
Population Dynamics and Age Structure of Bosmina Longirostris in an Acid Water Impoundment,
W80-03171 5C

CULTURES
Outdoor Algal Mass Cultures--I. Applications,
W80-03105 5G

A Comparison Between the Cell Division Rate of Natural Populations of the Marine Diatom Skeletonema Costatum (Greville) Cleve Grown in Dialysis Culture and That Predicted from a Mathematical Model,
W80-03109 5C

CYANIDES
A Fast Indicator for Detecting Gross Pollution by Hazardous Chemicals,
W80-03257 5A

CYCLING NUTRIENTS
Nutrient Budgets of a Temporary Pond Ecosystem,
W80-03123 5C

CYTOLOGICAL STUDIES
Effect of Chlorophos and Hexachlorane on Cell Cultures of Warm-Blooded and Cold-Blooded Animals,
W80-03242 5C

Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

The Cytochemical Distributions of Zinc (Zn II) and Iron (Fe III) in the Common Mussel, Mytilus Edulis, and Their Relationship with Lysosomes,
W80-03299 5B

DADE COUNTY (FL)
Estimated Drawdowns in the Floridan Aquifer Due to Increased Withdrawals, Duval County, Florida,
W80-03165 6A

DAMS
Effects of Dam Removal: An Approach to Sedimentation,
W80-03204 2J

DAPHNIA
Selenium Toxicity to Daphnia Magna, Hyallela Azteca, and the Fathead Minnow in Hard Water,
W80-03294 5A

DATA COLLECTIONS
Utility of a Computerized Data Base for Hydrogeologic Investigations, Las Vegas Valley, Nevada,
W80-03051 2F

Quality of Rivers of the United States, 1975 Water Year--Based on the National Stream Quality Accounting Network (NASQAN),
W80-03154 7C

Water-Resources Data, 1970-75, for Perris Valley and Vicinity, Riverside County, California,
W80-03156 7C

Occurrence, Quality, and Quantity of Ground Water in Wilbarger County, Texas,
W80-03209 7C

DATA STORAGE AND RETRIEVAL
Utility of a Computerized Data Base for Hydrogeologic Investigations, Las Vegas Valley, Nevada,
W80-03051 2F

DDT
Trace Metals and Organochlorine Residue Content of Mullidae Family Fishes and Sediments in the Vicinity of Erdemli (Icel), Turkey,
W80-03231 5A

Monitoring of Chlorinated Hydrocarbons in Biota and Sediments of South Adriatic Coastal Waters,
W80-03238 5A

The Effect of DDT and Hexachlorane on Assimilation and Outflow of 14C in Phragmites Communis,
W80-03240 5A

Preliminary Results on Uptake and Elimination at Different Temperatures of p,p'-DDT and Two Chlorobiphenyls in Perch from Brackish Water,
W80-03268 5A

Organochlorines and Metals in Harbour Seals (Dutch Wadden Sea),
W80-03280 5B

Effects of p,p'-DDT, p,p'-DDD, and p,p'-DDE on Oxygen Uptake in the Freshwater Planarian (Phagogata Gracilis),
W80-03291 5A

DEBRIS AVALANCHES
Secondary Permeability as a Possible Factor in the Origin of Debris Avalanches Associated with Heavy Rainfall,
W80-03048 2B

DECISION MAKING
Botswana's Present Climate and the Evidence for Past Change,
W80-03062 6A

DECOMPOSING ORGANIC MATTER
Effects of Nutrients and Temperature on Decomposition of Myriophyllum Spicatum L. in a Hard-Water Eutrophic Lake,
W80-03119 5C

Importance of a Bordering Wetland for Chemical Properties of Lake Water,
W80-03169 5B

DEEP-WELL WASTE DISPOSAL
Measuring the Risks of Waste Disposal by Deep-Well Injection,
W80-03005 6B

DEGRADATION (DECOMPOSITION)
Measurements of Mineralization of Phytoplankton Detritus in an Oligotrophic Lake,
W80-03107 5C

Effects of Nutrients and Temperature on Decomposition of Myriophyllum Spicatum L. in a Hard-Water Eutrophic Lake,
W80-03119 5C

DENITRIFICATION
Design of a Subsurface Waste Disposal System with Biological Denitrification,
W80-03174 5D

DEPOSITION (SEDIMENTS)
Deposition Velocity of Phosphorus-Containing Particles Over Southern Lake Huron, April-October, 1975,
W80-03117 5B

DEPRESSION STORAGE
Estimating Micro-Relief Surface Storage from Point Data,
W80-03179 2E

DEPTH-AREA-DURATION ANALYSIS
Correlation Analysis of the Jordan Valley Rainfall Field,
W80-03056 2B

DEPURATION
Accumulation and Excretion of 95Zr and 95Nb by Common Goby (Acanthogobius Flavimanus),
W80-03256 5A

Bioavailability of a Hydrocarbon from Water and Sediment to the Marine Worm Arenicola Marina,
W80-03260 5B

A Possible Physiological Uptake Mechanism of Methylmercury by the Marine Bloodworm (Glycera Dibranchiata),
W80-03293 5A

DESALINATION
Solar Energy Collectors and Plants Operated by Them,
W80-03225 3A

Water Purification System,
W80-03264 3A

DESERT SOILS
Impacts of Off-Road Vehicles on Infiltration and Sediment Production of Two Desert Soils,
W80-03057 2J

DESERTIFICATION
Desertification: Natural or Man-Induced,
W80-03064 2A

DESIGN
Design of a Subsurface Waste Disposal System with Biological Denitrification,
W80-03174 5D

DESTRATIFICATION
Biological and Water Quality Effects of Artificial Mixing of Arbuckle Lake, Oklahoma, During 1977,
W80-03170 5C

DETERGENTS
Distribution and Impact of Anionic Detergents on a Pelagic Ecosystem, (In French).
W80-03234 5B

Influence of Crude Oil and Detergents on the Concentration of some Ions in Hemolymph of the Shrimp Crangon Crangon L. and the Crab Rhithropanopeus Harrisi Gould,
W80-03277 5B

Purification and Properties of Soluble Arylsulphatases Isolated from Hepatopancreas of the Shrimp Crangon Crangon L.
W80-03278 5A

Review of Experiments on the Chronic Toxicity Exerted by Some Pollutants on Animal Species from the Bay of Gdansk,
W80-03298 5A

DEWATERING
Depressurization of a Multi-Layered Artesian System for Water and Grout Control During Deep Mine-Shaft Development,
W80-03038 2F

DIAGENESIS
Zinc in the Conwy River and Estuary,
W80-03029 2L

The Volume-Averaged Mass-Transport Equation for Chemical Diagenetic Models,
W80-03044 5B

DIALYSIS
A Comparison Between the Cell Division Rate of Natural Populations of the Marine Diatom Skeletonema Costatum (Greville) Cleve Grown in Dialysis Culture and That Predicted from a Mathematical Model,
W80-03109 5C

DIATOMS
A Comparison Between the Cell Division Rate of Natural Populations of the Marine Diatom Skeletonema Costatum (Greville) Cleve Grown in Dialysis Culture and That Predicted from a Mathematical Model,
W80-03109 5C

Uptake of Hydrocarbons by the Marine Diatom Cyclotella Cryptica,
W80-03267 5A

Diatoms and Water Quality in Lowland Streams in the Province of Northern Brabant (The Netherlands),
W80-03275 5C

DIPTERA
Chironomid Communities as Water Quality Indicators,
W80-03224 5C

DISCHARGE (WATER)
Relationships Between Stream Discharge and Yield of Dissolved Substances from a Colorado Mountain Watershed,
W80-03191 5B

DISPERSANTS
Toxicity Testing in the United Kingdom for the Evaluation of Oil Slick Dispersants,
W80-03214 5A

Acute Aquatic Toxicity and Dispersing Effectiveness of Oil Spill Dispersants: Results of a Canadian Oil Dispersant Testing Program (1973 to 1977),
W80-03215 5A

Effect of a Chemical Dispersant on Microbial Utilization of Petroleum Hydrocarbons,
W80-03216 5A

Effects of Dispersant Use on Shore Life,
W80-03217 5C

Ecological Effects of Dispersants in the United Kingdom,
W80-03218 5B

Review of Experiments on the Chronic Toxicity Exerted by Some Pollutants on Animal Species from the Bay of Gdansk,
W80-03298 5A

DISPOSAL
Alternatives for Wastewater Treatment in Rural Areas,
W80-03131 5D

DISSOLVED OXYGEN
Oxygen Deficit--Phosphorus Loading Relation in Lakes,
W80-03185 5B

DITCHES
Public Drainage Atlas: Brown County, Minnesota,
W80-03095 4A

Public Drainage Atlas: Nicollet County, Minnesota,
W80-03096 4A

Public Drainage Atlas: Lesueur County, Minnesota,
W80-03097 4A

DOLORES RIVER BASIN
Water Resources Data for Colorado, Water Year 1978--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W80-03151 7C

DOMESTIC WASTES
Monitoring the Effects of Domestic and Industrial Wastes,
W80-03023 5C

Study of the Dynamics of the Benthic Populations of the Bay of Algiers, Preliminary Results (In French),
W80-03235 5C

DOMINANT ORGANISMS
Population Dynamics and Age Structure of Bosmina Longirostris in an Acid Water Impoundment,
W80-03171 5C

DRAINAGE
Public Drainage Atlas: Brown County, Minnesota,
W80-03095 4A

Public Drainage Atlas: Nicollet County, Minnesota,
W80-03096 4A

Public Drainage Atlas: Lesueur County, Minnesota,
W80-03097 4A

DRAWDOWN
Estimated Drawdowns in the Floridan Aquifer Due to Increased Withdrawals, Duval County, Florida,
W80-03165 6A

DROUGHTS
The Problem of Drought in Botswana,

The Development of Water Quality Criteria for Ammonia and Total Residual Chlorine for the Protection of Aquatic Life in Two Johnson County, Kansas Streams,
W80-03082 5C

KARSTIC AQUIFERS
The Simulation of Transmissivity, Storativity and Evapotranspiration in a Digital Model of a Fissured Dolomite Aquifer Near Ndola, Zambia,
W80-03033 2F

KENTUCKY
Potentiometric Surface of the Mississippian Aquifer in Parts of Trigg, Lyon, Caldwell, and Christian Counties, Mississippian Plateau Region, Kentucky,
W80-03155 2F

Evaluation of TVA Streamflow Model on Small Kentucky Watersheds,
W80-03182 2E

Landslide-Prone Soils of Southwestern Pennsylvania,
W80-03190 2G

KIDNEY
Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

KINETICS
Biosynthesis and Release of Organoarsenic Compounds by Marine Algae,
W80-03118 5C

LABORATORY TESTS
Theoretical and Experimental Study of Wind- and Wave-Induced Drift,
W80-03031 5B

Time-Dependent Sorption on Geological Materials,
W80-03045 5B

Influence of Certain Waste Waters Containing Ammonia, Urea and Methanol on Unicellular Marine Algae (In French),
W80-03227 5A

LAGO JANAUACA
Amazon Lakes: Water Storage and Nutrient Stripping by Algae,
W80-03108 5C

LAKE GEORGE (NY)
Impact of Development on Watershed Hydrologic and Nutrient Budgets,
W80-03186 5B

LAKE HURON
Deposition Velocity of Phosphorus-Containing Particles Over Southern Lake Huron, April-October, 1975,
W80-03117 5B

LAKE KINNERET (ISRAEL)
A Theory of the Mean Flow Driven by Long Internal Waves in a Rotating Basin, with Application to Lake Kinneret,
W80-03032 2H

LAKE WINGRA (WI)
Effects of Nutrients and Temperature on Decomposition of Myriophyllum Spicatum L. in a Hard-Water Eutrophic Lake,
W80-03119 5C

Impact of Development on Watershed Hydrologic and Nutrient Budgets,
W80-03186 5B

LAKES
A Theory of the Mean Flow Driven by Long Internal Waves in a Rotating Basin, with Application to Lake Kinneret,
W80-03032 2H

A Discrete Model for the Study of a Lake,
W80-03106 5C

Oxygen Deficit--Phosphorus Loading Relation in Lakes,
W80-03185 5B

Impact of Development on Watershed Hydrologic and Nutrient Budgets,
W80-03186 5B

Eutrophication, Minute Algae and Inefficient Grazers,
W80-03211 5B

Heavy Metals (Hg, Cd, Cu, Pb, Zn) in Liver and Muscle Tissue of Fresh-Water Perch (Perca Fluviatilis) of the Lake of Biel and the Walensee (In German),
W80-03269 5A

LAND APPLICATION
Utilization of Municipal Sewage Effluent and Sludge on Forest and Disturbed Land.
W80-03089 6G

Effect of Spray Irrigation of Treated Municipal Sewage Effluent on the Accumulation and Decomposition of the Forest Floor,
W80-03090 6G

Effect of Municipal Wastewater Irrigation on the Physical Properties of the Soil,
W80-03091 6G

Effects of Municipal Wastewater Irrigation on Wildlife and Wildlife Habitat,
W80-03092 6G

LAND DEVELOPMENT
The Use of Development Value Estimates for Coastal Wetland Permit Decisions,
W80-03144 6B

LAND MANAGEMENT
Assessing Impacts of Land Management Activities on Erosion-Related Nonpoint Source Problems,
W80-03113 5B

Hydrologic Considerations in Decision Analyses for Reclaiming Strip Mine Land in the Southwest,
W80-03176 4A

LAND RECLAMATION
Hydrologic Considerations in Decision Analyses for Reclaiming Strip Mine Land in the Southwest,
W80-03176 4A

LAND RESOURCES
Market Methods of Multiple Use Reconciliation,
W80-03147 6C

LAND USE
Controlling Land Use for Water Management and Urban Growth Management: A Policy Analysis,
W80-03077 6E

An Assessment of the On-Site Waste Water Management Program in the State of Maine,
W80-03083 6E

Nutrient Loads in Streamflow from Sandy Soils in Florida,
W80-03184 5B

LANDSLIDES
Secondary Permeability as a Possible Factor in the Origin of Debris Avalanches Associated with Heavy Rainfall,
W80-03048 2B

Landslide-Prone Soils of Southwestern Pennsylvania,
W80-03190 2G

LAOMEDEA
Toxic Effects and Accumulation of Cadmium in Some Benthic Organisms of the Baltic,
W80-03297 5A

LARVICIDES
Sub-Lethal Effects of the Organophosphate Black Fly Larvicide, Abate (Temephos) on Sarotherodon Mossambicus (Peters),
W80-03261 5C

LAS VEGAS (NV)
Utility of a Computerized Data Base for Hydrogeologic Investigations, Las Vegas Valley, Nevada,
W80-03051 2F

LAW OF THE SEA
200-Mile Economic Zones -- Fishing Limits and the E.E.C.,
W80-03141 6E

LAWNS
Water Requirements for Urban Lawns,
W80-03002 3D

LEACHING
Simulation of Nitrogen and Phosphorus Leaching from Poultry Manure,
W80-03181 5B

LEAD
Levels of Metal Pollutants in Sediments and Biota of the Gulf of Trieste: A Long Term Survey,
W80-03228 5A

Trace Metals and Organochlorine Residue Content of Mullidae Family Fishes and Sediments in the Vicinity of Erdemli (Icel), Turkey,
W80-03231 5A

Accumulation and Distribution of Heavy Metals in Some Marine Organisms in the Bay of Izmir and in Aegean Coasts,
W80-03239 5A

Heavy Metals (Hg, Cd, Cu, Pb, Zn) in Liver and Muscle Tissue of Fresh-Water Perch (Perca Fluviatilis) of the Lake of Biel and the Walensee (In German),
W80-03269 5A

Organochlorines and Metals in Harbour Seals (Dutch Wadden Sea),
W80-03280 5B

Effect of Long-Term Lead Exposure on the Seawater and Sediment Bacteria from Heterogeneous Continuous Flow Cultures,
W80-03283 5A

Concentrations of Arsenic, Selenium and Ten Heavy Metals in School Shark, Galeorhinus Australis (Macleay), and Gummy Shark, Mustelus Antarcticus Gunther, from South-Eastern Australian Waters,
W80-03285 5A

Combined Effects of Cadmium, Copper and Lead on Developing Herring Eggs and Larvae,
W80-03286 5A

Lead Toxicosis and Salt Glands in Domestic Ducks,
W80-03287 5B

Heavy Metals in the Sediments of the Gulf of Bothnia,
W80-03295 5A

LEGISLATION
Rural Water: State-Federal Relationships,
W80-03128 6E

LEIOSTOMUS
Ventilation Frequency Compensation Responses of Three Eurythermal Estuarine Fish Exposed to Moderate Temperature Increases,
W80-03262 5C

LIGHT INTENSITY
Effect of Growth Irradiance on the Maximum Photosynthetic Capacity of Water Hyacinth (Eichhornia Crassipes (Mart.) Solms),
W80-03114 5C

LIPIDS
Wax Esters in the Marine Environment: Origin and Composition of the Wax from Bute Inlet, British Columbia,
W80-03254 5A

LIVER
Effect of Dissolved Petroleum Products on Carbohydrate Metabolism of the Liver of Two Black Sea Species of Fishes,
W80-03223 5B

Heavy Metals (Hg, Cd, Cu, Pb, Zn) in Liver and Muscle Tissue of Fresh-Water Perch (Perca Fluviatilis) of the Lake of Biel and the Walensee (In German),
W80-03269 5A

LIVESTOCK
Drought and Arable Farming,
W80-03074 6A

LOANS
Financing Your Pollution Control Needs,
W80-03145 6C

LOCAL GOVERNMENTS
The Politics of Irrigation: An Empirical Test of Democracy in Great Plains Resource Districts,
W80-03086 6E

LONG ISLAND SOUND (NY)
Spatial Variability of Phytoplankton Biomass in the Surface Waters of Long Island,
W80-03104 5C

LOST POND (MA)
Nutrient Budgets of a Temporary Pond Ecosystem,
W80-03123 5C

LOW-FLOW FREQUENCY
Flow Routing in the Susquehanna River Basin: Part II Low-Flow Frequency Characteristics of the Susquehanna River Between Waverly, New York and Sunbury, Pennsylvania,
W80-03163 6A

MAGNESIUM
Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

MAINE
An Assessment of the On-Site Waste Water Management Program in the State of Maine,
W80-03083 6E

An Approach for Hydrodynamic Modeling of Maine's Estuaries,
W80-03084 2L

MAINTENANCE
Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

MALFUNCTION RATES
Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

MAMMALS
Monitoring Whale and Seal Populations,
W80-03020 5C

MANAGEMENT
A Process for Community Flood Plain Management.
W80-03079 6A

Some Aspects of Management-Rural Water Systems,
W80-03134 6B

MANGANESE
Trace Elements in Mesopelagic and Some Coastal Fish from the Adriatic,
W80-03233 5A

Accumulation and Distribution of Heavy Metals in Some Marine Organisms in the Bay of Izmir and in Aegean Coasts,
W80-03239 5A

Organochlorines and Metals in Harbour Seals (Dutch Wadden Sea),
W80-03280 5B

Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

Concentrations of Arsenic, Selenium and Ten Heavy Metals in School Shark, Galeorhinus Australis (Macleay), and Gummy Shark, Mustelus Antarcticus Gunther, from South-Eastern Australian Waters,
W80-03285 5A

Heavy Metals in the Sediments of the Gulf of Bothnia,
W80-03295 5A

MANURE
Ammonia Volatilization of Winter Spread Manure,
W80-03122 5C

MAPPING
A Mini-Guide to the Water Resources of Botswana,
W80-03063 2A

Public Drainage Atlas: Brown County, Minnesota,
W80-03095 4A

Public Drainage Atlas: Nicollet County, Minnesota,
W80-03096 4A

Public Drainage Atlas: Lesueur County, Minnesota,
W80-03097 4A

MAPS
Potentiometric Surface of the Mississippian Aquifer in Parts of Trigg, Lyon, Caldwell, and Christian Counties, Mississippian Plateau Region, Kentucky,
W80-03155 2F

MARINE ALGAE
Biosynthesis and Release of Organoarsenic Compounds by Marine Algae,
W80-03118 5C

Impact of the Urban Effluent of Cortiou on the Neritic Phytoplankton Populations (In French), Groupe Equipe Pollution Pelagique de Marseille (Group EPOPEM).

W80-03051 2F

Unsteady Streamflow Modeling Guidelines,
W80-03167 2E

NEW MEXICO
Depressurization of a Multi-Layered Artesian System for Water and Grout Control During Deep Mine-Shaft Development,
W80-03038 2F

Potential Use of Digital Computer Ground Water Models,
W80-03202 2F

NEW RIVER (CALIF)
Water-Quality Conditions in the New River, Imperial County, California,
W80-03164 5B

NICKEL
Concentrations of Arsenic, Selenium and Ten Heavy Metals in School Shark, Galeorhinus Australis (Macleay), and Gummy Shark, Mustelus Antarcticus Gunther, from South-Eastern Australian Waters,
W80-03285 5A

Heavy Metals in the Sediments of the Gulf of Bothnia,
W80-03295 5A

NIOBIUM RADIOISOTOPES
Accumulation and Excretion of 95Zr and 95Nb by Common Goby (Acanthogobius Flavimanus),
W80-03256 5A

NITROGEN
Impact of Development on Watershed Hydrologic and Nutrient Budgets,
W80-03186 5B

Indicators of Phosphorus and Nitrogen Deficiency in Five Algae in Culture,
W80-03258 5A

NITROGEN FIXATION
Relationship Between Productivity and N2 (C2H2) Fixation in a Thalassia Testudinum Community,
W80-03124 5C

NONACHLOR
Identification of Chlordanes and Related Compounds in Goby-Fish from Tokyo Bay,
W80-03290 5A

NONPOINT POLLUTION
Assessing Impacts of Land Management Activities on Erosion-Related Nonpoint Source Problems,
W80-03113 5B

NORTH CAROLINA
The Impacts of Rural Water Systems in North Carolina: An Exploratory Study.
W80-03003 6C

NORTH DAKOTA
Rural Water: State Programs,
W80-03127 6B

Rural Water: State-Federal Relationships,
W80-03128 6E

NORTH SEA
A Study of the Distribution of Mercury in the Various Compartments of the North Sea and Scheldt Estuary Ecosystems,
W80-03213 5A

NUTRIENT BUDGETS
Nutrient Budgets of a Temporary Pond Ecosystem,
W80-03123 5C

NUTRIENT LOADING
Expressing the Phosphorus Loading Concept in Probabilistic Terms,
W80-03120 5C

NUTRIENT REQUIREMENTS
Indicators of Phosphorus and Nitrogen Deficiency in Five Algae in Culture,
W80-03258 5A

NUTRIENT TRANSPORT
Importance of a Bordering Wetland for Chemical Properties of Lake Water,
W80-03169 5B

NUTRIENTS
Amazon Lakes: Water Storage and Nutrient Stripping by Algae,
W80-03108 5C

Effects of Nutrients and Temperature on Decomposition of Myriophyllum Spicatum L. in a Hard-Water Eutrophic Lake,
W80-03119 5C

Simulating Nutrient Movement and Transformations with the Arm Model,
W80-03180 5B

Tillage System Effects on Sediment and Nutrients in Runoff from Small Watersheds,
W80-03183 5B

Nutrient Loads in Streamflow from Sandy Soils in Florida,
W80-03184 5B

Impact of Development on Watershed Hydrologic and Nutrient Budgets,
W80-03186 5B

Eutrophication, Minute Algae and Inefficient Grazers,
W80-03211 5B

Influence of Certain Waste Waters Containing Ammonia, Urea and Methanol on Unicellular Marine Algae (In French),
W80-03227 5A

OFF-ROAD VEHICLES
Impacts of Off-Road Vehicles on Infiltration and Sediment Production of Two Desert Soils,
W80-03057 2J

OHIO
Water Resources Data for Ohio, Water Year 1978--Volume 1. Ohio River Basin.
W80-03152 7C

Water Resources Data for Ohio, Water Year 1978--Volume 2. St. Lawrence River Basin.
W80-03153 7C

Landslide-Prone Soils of Southwestern Pennsylvania,
W80-03190 2G

OHIO RIVER BASIN
Water Resources Data for Ohio, Water Year 1978--Volume 1. Ohio River Basin.
W80-03152 7C

OIL
Effect of a Chemical Dispersant on Microbial Utilization of Petroleum Hydrocarbons,
W80-03216 5A

Effect of Dissolved Petroleum Products on Carbohydrate Metabolism of the Liver of Two Black Sea Species of Fishes,
W80-03223 5B

Environmental Influences on the Development of Oil-Decomposing Microorganisms,
W80-03245 5E

Bioavailability of a Hydrocarbon from Water and Sediment to the Marine Worm Arenicola Marina,
W80-03260 5B

Uptake of Hydrocarbons by the Marine Diatom Cyclotella Cryptica,
W80-03267 5A

Influence of Crude Oil and Detergents on the Concentration of some Ions in Hemolymph of the Shrimp Crangon Crangon L. and the Crab Rhithropanopeus Harrisi Gould,
W80-03277 5B

Effects of Crude Oil on the Development of the Shell of Mytilus edulis (L) (Mytilidae, Bivalvia), (In French),
W80-03284 5B

Review of Experiments on the Chronic Toxicity Exerted by Some Pollutants on Animal Species from the Bay of Gdansk,
W80-03298 5A

OIL DISPERSANTS
Toxicity Testing in the United Kingdom for the Evaluation of Oil Slick Dispersants,
W80-03214 5A

Acute Aquatic Toxicity and Dispersing Effectiveness of Oil Spill Dispersants: Results of a Canadian Oil Dispersant Testing Program (1973 to 1977),
W80-03215 5A

Effect of a Chemical Dispersant on Microbial Utilization of Petroleum Hydrocarbons,
W80-03216 5A

Effects of Dispersant Use on Shore Life,
W80-03217 5C

Ecological Effects of Dispersants in the United Kingdom,
W80-03218 5B

OIL POLLUTION
Pollution of the Marine Environment,
W80-03011 5C

Monitoring Whale and Seal Populations,
W80-03020 5C

Biological Monitoring Around an Oil Refinery,
W80-03021 5C

Floating Oil Skimmer,
W80-03143 5G

OIL SPILLS
The Tsesis Oil Spill: Its Impact on the Coastal Ecosystem of the Baltic Sea,
W80-03012 5C

Theoretical and Experimental Study of Wind- and Wave-Induced Drift,
W80-03031 5B

Acute Aquatic Toxicity and Dispersing Effectiveness of Oil Spill Dispersants: Results of a Canadian Oil Dispersant Testing Program (1973 to 1977),
W80-03215 5A

Effects of Dispersant Use on Shore Life,
W80-03217 5C

Ecological Effects of Dispersants in the United Kingdom,
W80-03218 5B

OLIGOTROPHY
Measurements of Mineralization of Phytoplankton Detritus in an Oligotrophic Lake,
W80-03107 5C

OPTIMIZATION
Uncertainty and Allocation Decisions Involving Unique Environmental Resources,
W80-03146 6B

OREGON
Willamette River Sediment Management Possibilities: Phase I -- Problem Clarification,
W80-03008 2J

Assessing Impacts of Land Management Activities on Erosion-Related Nonpoint Source Problems,
W80-03113 5B

ORGANIC COMPOUNDS
Hydrocarbon Characteristics of the Organs and Tissues of Some Marine Fishes from the Mediterranean,
W80-03248 5B

The Effect of Chemical Mutagens on the Spermatozoa of the Silver Carp, Hypophthalmichthys Molitrix, and the Bighead, Aristichthys Nobilis,
W80-03249 5C

ORGANIC POLLUTANTS
Methods for the Assessment of Aqueous Organic Materials,
W80-03006 5A

ORGANIC WASTES
Water-Quality Conditions in the New River, Imperial County, California,
W80-03164 5B

ORTHOPHOSPHATE
Functionally Distinct Classes of Complex Phosphorus Compounds in Lake Water,
W80-03110 5C

OSMOREGULATION
Lead Toxicosis and Salt Glands in Domestic Ducks,
W80-03287 5B

OUTAGAMIE COUNTY (WI)
Gravity Survey of a Deep Buried Valley,
W80-03188 2F

OUTER CONTINENTAL SHELF
Pollution of the Marine Environment,
W80-03011 5C

The Tsesis Oil Spill: Its Impact on the Coastal Ecosystem of the Baltic Sea,
W80-03012 5C

Monitoring the Marine Environment, Proceedings of a Symposium Held at the Royal Geographical Society, London, on 28 and 29 September 1978.
W80-03013 5C

Intertidal Surveillance,
W80-03014 5C

Monitoring the Effect of Oil Pollution on Rocky Seashores,
W80-03015 5C

Systematic Surveys and Monitoring in Nearshore Sublittoral Areas Using Diving,
W80-03016 5C

Monitoring with Deep Submersibles,
W80-03017 5C

Continuous Plankton Records: Monitoring the Plankton of the North Atlantic and the North Sea,
W80-03018 5C

The Monitoring of Substances in Marine Waters for Genetic Damage,
W80-03019 5C

Monitoring Whale and Seal Populations,
W80-03020 5C

Biological Monitoring Around an Oil Refinery,
W80-03021 5C

Monitoring Radioactivity in the Marine Environment,
W80-03022 5C

Monitoring the Effects of Domestic and Industrial Wastes,
W80-03023 5C

Marine Wildlife Conservation in the Coastal Zone,
W80-03024 5C

OXIDATION POND EFFLUENT
Sand Filtration of Oxidation Pond Effluent for Reuse in Park Irrigation,
W80-03004 5D

OXIDATION-REDUCTION POTENTIAL
Arsenic Species as an Indicator of Redox Conditions in Groundwater,
W80-03046 2K

OXYGEN REQUIREMENTS
Effects of p,p'-DDT, p,p'-DDD, and p,p'-DDE on Oxygen Uptake in the Freshwater Planarian (Phagogata Gracilis),
W80-03291 5A

PALEOCLIMATOLOGY
Botswana's Present Climate and the Evidence for Past Change,
W80-03062 6A

PALEOLIMNOLOGY
Diatom and Chrysophycean Cyst Profiles in Sediment Cores from Two Linked But Contrasting Welsh Lakes,
W80-03101 5C

PARAFFINS
Hydrocarbon Characteristics of the Organs and Tissues of Some Marine Fishes from the Mediterranean,
W80-03248 5B

Uptake of Hydrocarbons by the Marine Diatom Cyclotella Cryptica,
W80-03267 5A

PASTURE MANAGEMENT
Drought in the Sahel: A Broader Interpretation, With Regard to West Africa and Ethiopia,
W80-03068 6B

The Tribal Grazing Land Policy's Relevance in a Drought-Prone Environment,
W80-03075 6A

PATENTS
Method for Preventing the Contamination of Subsoil Water from Products Deposited on the Ground or in Underground Cavities,
W80-03025 5G

Polymers for Preventing and Removing Scale in Boilers,
W80-03103 5F

Polyphosphate-Based Industrial Cooling Water Treatment,
W80-03139 5F

Floating Oil Skimmer,
W80-03143 5G

Linear Move Irrigation System and Control Therefor,
W80-03196 3F

Self-Propelled Linear Irrigation System,
W80-03197 3F

Armour Unit for Wave Energy Absorption,
W80-03207 8A

Solar Energy Collectors and Plants Operated by Them,
W80-03225 3A

Water Purification System,
W80-03264 3A

Apparatus for Treating Metal Containing Waste Waters,
W80-03265 5D

Waste Water Process for Treatment of Strong Wastes,
W80-03266 5D

Process for the Separation of Cadmium (CD++) Ions from Sewage, Waste Water and Aqueous Solutions,
W80-03270 5D

Ozonation of Cooling Tower Waters,
W80-03271 5F

Water Purifier Apparatus,
W80-03272 5G

Outlet for Septic Tanks,
W80-03273 5D

Method for the Separation from Each Other of the Components of a Mixture of Water, Oil and Dirt (Sludge) as Well as Apparatus for Performing Said Method,
W80-03274 5D

Gravitational Flow Separator of the Multiple, Apertured Tube Type for Separating Water from Sand, Gravel or the Like,
W80-03281 5D

PATH OF POLLUTANTS

A Study of the Distribution of Mercury in the Various Compartments of the North Sea and Scheldt Estuary Ecosystems,
W80-03213 5A

The Role of Zooplankton Fecal Pellets in the Sedimentation of Polycyclic Aromatic Hydrocarbons in Dabob Bay, Washington,
W80-03220 5A

Trace Elements in Pelagic Organisms and a Pelagic Foodchain of the Aegean Sea,
W80-03229 5A

Distribution and Impact of Anionic Detergents on a Pelagic Ecosystem, (In French).
W80-03234 5B

Assimilation Efficiency of Dietary Methylmercury by Northern Pike (Esox Lucius),
W80-03253 5A

Heavy Metals in the Sediments of the Gulf of Bothnia,
W80-03295 5A

PEAK DISCHARGE

Adjustment of Peak Discharge Rates for Urbanization,
W80-03200 2A

PECTEN

Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

PENMAN-MONTEITH EQUATION

A Sensitivity Analysis of the Penman-Monteith Actual Evapotranspiration Estimates,
W80-03036 2D

PENNSYLVANIA

Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

Landslide-Prone Soils of Southwestern Pennsylvania,
W80-03190 2G

PERCHES

Heavy Metals (Hg, Cd, Cu, Pb, Zn) in Liver and Muscle Tissue of Fresh-Water Perch (Perca Fluviatilis) of the Lake of Biel and the Walensee (In German),
W80-03269 5A

PERMEABILITY

Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

PERRIS VALLEY (CA)

Water-Resources Data, 1970-75, for Perris Valley and Vicinity, Riverside County, California,
W80-03156 7C

PESTICIDE KINETICS

The Effect of DDT and Hexachlorane on Assimilation and Outflow of 14C in Phragmites Communis,
W80-03240 5A

Concentration of the Herbicide 2,4-D by Some Higher Water Plants,
W80-03243 5B

Preliminary Results on Uptake and Elimination at Different Temperatures of p,p'-DDT and Two Chlorobiphenyls in Perch from Brackish Water,
W80-03268 5A

PESTICIDE RESIDUES

Monitoring of Chlorinated Hydrocarbons in Biota of the North and Middle Adriatic Coastal Waters,
W80-03226 5B

Monitoring of Chlorinated Hydrocarbons in Water and Sediments of the North Adriatic Coastal Waters,
W80-03237 5A

Monitoring of Chlorinated Hydrocarbons in Biota and Sediments of South Adriatic Coastal Waters,
W80-03238 5A

PCBs and DDE in Commercial Fish Feeds,
W80-03259 5A

Mercury, DDE, and PCBs in Eggs from a Norwegian Gannet Colony,
W80-03288 5A

Identification of Chlordanes and Related Compounds in Goby-Fish from Tokyo Bay,
W80-03290 5A

PESTICIDE TOXICITY

Effect of Chlorophos and Hexachlorane on Cell Cultures of Warm-Blooded and Cold-Blooded Animals,
W80-03242 5C

Sub-Lethal Effects of the Organophosphate Black Fly Larvicide, Abate (Temephos) on Sarotherodon Mossambicus (Peters),
W80-03261 5C

Organochlorines and Metals in Harbour Seals (Dutch Wadden Sea),
W80-03280 5B

Toxic Effects of the Phytoalkaloid Colchicine on Oviposition and Neurosecretion of the Vector Snail (Indoplanorbis Exustus),
W80-03289 5A

Effects of p,p'-DDT, p,p'-DDD, and p,p'-DDE on Oxygen Uptake in the Freshwater Planarian (Phagogata Gracilis),
W80-03291 5A

PHAGOCATA

Effects of p,p'-DDT, p,p'-DDD, and p,p'-DDE on Oxygen Uptake in the Freshwater Planarian (Phagogata Gracilis),
W80-03291 5A

PHENOLS

An Electromyogram of the Mandibular Adductor of the Intact Baikal Grayling, Thymallus Arcticus Baicalensis, in a Phenol Solution,
W80-03247 5C

PHOSPHATES

Simulated Changes in Potentiometric Levels Resulting from Groundwater Development for Phosphate Mines, West-Central Florida,
W80-03040 2F

Groundwater Flow Systems in the Western Phosphate Field in Idaho,
W80-03055 2F

Sorption of Phosphate by Danish Lake Sediments,
W80-03102 5C

The Impacts of Wastes from a Phosphate Plant on the Marine Environment (Gulf of Gabes, Tunis) (In French),
W80-03232 5B

PHOSPHOGYPSUM

Review of Experiments on the Chronic Toxicity Exerted by Some Pollutants on Animal Species from the Bay of Gdansk,
W80-03298 5A

PHOSPHORUS

Deposition Velocity of Phosphorus-Containing Particles Over Southern Lake Huron, April-October, 1975,
W80-03117 5B

Expressing the Phosphorus Loading Concept in Probabilistic Terms,
W80-03120 5C

Oxygen Deficit--Phosphorus Loading Relation in Lakes,
W80-03185 5B

Impact of Development on Watershed Hydrologic and Nutrient Budgets,
W80-03186 5B

Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

PHOSPHORUS COMPOUNDS

Functionally Distinct Classes of Complex Phosphorus Compounds in Lake Water,
W80-03110 5C

Review of Experiments on the Chronic Toxicity Exerted by Some Pollutants on Animal Species from the Bay of Gdansk,
W80-03298 5A

PHOTOSYNTHESIS

Measurement of Carbon Dioxide Compensation Points of Freshwater Algae,
W80-03010 5C

Outdoor Algal Mass Cultures--I. Applications,
W80-03105 5G

Effect of Growth Irradiance on the Maximum Photosynthetic Capacity of Water Hyacinth (Eichhornia Crassipes (Mart.) Solms),
W80-03114 5C

PHYTOPLANKTON

Spatial Variability of Phytoplankton Biomass in the Surface Waters of Long Island,
W80-03104 5C

PHYTOPLANKTON

Measurements of Mineralization of Phytoplankton Detritus in an Oligotrophic Lake,
W80-03107 5C

ATP as a Measure of Living Phytoplankton Carbon in Estuaries,
W80-03115 5C

Notes on the Phytoplankton Periodicity of Rostherne Mere, Cheshire, 1967-1977,
W80-03116 5C

Influence of Certain Waste Waters Containing Ammonia, Urea and Methanol on Unicellular Marine Algae (In French),
W80-03227 5A

Impact of the Urban Effluent of Cortiou on the Neritic Phytoplankton Populations (In French), Groupe Equipe Pollution Pelagique de Marseille (Group EPOPEM).
W80-03255 5C

PIKES

Assimilation Efficiency of Dietary Methylmercury by Northern Pike (Esox Lucius),
W80-03253 5A

PIPELINES

Slurry Flow in Pipe Networks,
W80-03193 8B

PLANARIANS

Effects of p,p'-DDT, p,p'-DDD, and p,p'-DDE on Oxygen Uptake in the Freshwater Planarian (Phagogata Gracilis),
W80-03291 5A

PLANKTON

Continuous Plankton Records: Monitoring the Plankton of the North Atlantic and the North Sea,
W80-03018 5C

Planktonic Systems and Urban Pollution: Study of Plankton Populations, (In French).
W80-03212 5C

PLANNING

Problems of Large-Scale Groundwater Development,
W80-03043 4B

A Process for Community Flood Plain Management.
W80-03079 6A

Nebraska Water-Data Programs, 1979.
W80-03159 7C

A Model for Evaluating Runoff-Quality in Metropolitan Master Planning,
W80-03199 5B

PLANT PHYSIOLOGY

Effect of Growth Irradiance on the Maximum Photosynthetic Capacity of Water Hyacinth (Eichhornia Crassipes (Mart.) Solms),
W80-03114 5C

The Effect of DDT and Hexachlorane on Assimilation and Outflow of 14C in Phragmites Communis,
W80-03240 5A

POLITICAL ASPECTS

The Politics of Irrigation: An Empirical Test of Democracy in Great Plains Resource Districts,
W80-03086 6E

POLITICAL CONSTRAINTS

Controlling Land Use for Water Management and Urban Growth Management: A Policy Analysis,
W80-03077 6E

POLLUTANT IDENTIFICATION

Polycyclic Aromatic Hydrocarbon Carcinogens in Commercial Seafoods,
W80-03252 5A

Wax Esters in the Marine Environment: Origin and Composition of the Wax from Bute Inlet, British Columbia,
W80-03254 5A

Identification of Chlordanes and Related Compounds in Goby-Fish from Tokyo Bay,
W80-03290 5A

POLLUTION ABATEMENT

Demonstration of Nonpoint Pollution Abatement Through Improved Street Cleaning Practices,
W80-03098 5B

Monopoly-Power as a Means for Pollution-Control.
W80-03148 6C

POLYCHAETES

The Effect of Hypoxia and Anoxia on the Species and Numbers of Black Sea Polychaeta,
W80-03246 5C

POLYCHLORINATED BIPHENYLS

Trace Metals and Organochlorine Residue Content of Mullidae Family Fishes and Sediments in the Vicinity of Erdemli (Icel), Turkey,
W80-03231 5A

Monitoring of Chlorinated Hydrocarbons in Water and Sediments of the North Adriatic Coastal Waters,
W80-03237 5A

Monitoring of Chlorinated Hydrocarbons in Biota and Sediments of South Adriatic Coastal Waters,
W80-03238 5A

Preliminary Results on Uptake and Elimination at Different Temperatures of p,p'-DDT and Two Chlorobiphenyls in Perch from Brackish Water,
W80-03268 5A

POPULATION

Population Dynamics and Age Structure of Bosmina Longirostris in an Acid Water Impoundment,
W80-03171 5C

POPULATIONS

Drought and Migration: The Lake Malawi Littoral as a Region of Refuge,
W80-03070 6G

POROSITY

Effect of Municipal Wastewater Irrigation on the Physical Properties of the Soil,
W80-03091 6G

PORT PHILLIP BAY

A Three-Year Study of Benthos of Muddy Environments in Port Phillip Bay, Victoria,
W80-03028 2L

POTABLE WATER

Assuring Adequate Supply: Quantity and Quality,
W80-03129 6D

Some Aspects of Management-Rural Water Systems,
W80-03134 6B

POTENTIOMETRIC LEVEL

Simulated Changes in Potentiometric Levels Resulting from Groundwater Development for Phosphate Mines, West-Central Florida,
W80-03040 2F

Potentiometric Surface of the Mississippian Aquifer in Parts of Trigg, Lyon, Caldwell, and Christian Counties, Mississippian Plateau Region, Kentucky,
W80-03155 2F

PRICING

Efficiency in the Use of Water for Irrigation: The Role of Prices and Regulations,
W80-03140 3F

Market Methods of Multiple Use Reconciliation,
W80-03147 6C

PRIMARY PRODUCTION

Relationship Between Productivity and N2 (C2H2) Fixation in a Thalassia Testudinum Community,
W80-03124 5C

PROBABILITY

Expressing the Phosphorus Loading Concept in Probabilistic Terms,
W80-03120 5C

PROJECTIONS

Estimated Drawdowns in the Floridan Aquifer Due to Increased Withdrawals, Duval County, Florida,
W80-03165 6A

PROJECTS

Nebraska Water-Data Programs, 1979.
W80-03159 7C

PUBLICATIONS

Nebraska Water-Data Programs, 1979.
W80-03159 7C

PUERTO RICO

Water Budget and Hydraulic Aspects of Artificial Recharge, South Coast of Puerto Rico,
W80-03160 4B

Floods in Puerto Rico, Magnitude and Frequency,
W80-03161 2E

PUMPING

Simulated Changes in Potentiometric Levels Resulting from Groundwater Development for Phosphate Mines, West-Central Florida,
W80-03040 2F

QUESTIONNAIRE

Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

RADIATION

On the Correspondence of Data on the Incubation of Fish Eggs in Solutions of Strontium-90 -- Yttrium-90 of Varying Activity Under Laboratory Conditions and in Natural Waters,
W80-03250 5A

RADIOACTIVITY

Monitoring Radioactivity in the Marine Environment,
W80-03022 5C

RADIOISOTOPES

Time-Dependent Sorption on Geological Materials,
W80-03045 5B

Accumulation and Excretion of 95Zr and 95Nb by Common Goby (Acanthogobius Flavimanus),
W80-03256 5A

RAINBOW TROUT

Effects of Abrupt Change in Water Quality on Rainbow Trout (Salmo Gairdneri Rich.),
W80-03210 5A

A Fast Indicator for Detecting Gross Pollution by Hazardous Chemicals,
W80-03257 5A

RAINFALL
Secondary Permeability as a Possible Factor in the Origin of Debris Avalanches Associated with Heavy Rainfall,
W80-03048 2B

Southern African Rainfall: Past, Present and Future,
W80-03061 2B

RAINFALL DISPOSITION
Correlation Analysis of the Jordan Valley Rainfall Field,
W80-03056 2B

RANGE MANAGEMENT
Effects of Grazing on Runoff and Sediment Yield from Desert Rangeland at Badger Wash in Western Colorado, 1953-73,
W80-03166 4C

RECHARGE WELLS
Connector Wells, A Mechanism for Water Management in the Central Florida Phosphate District,
W80-03041 4B

RECLAIMED WATER
Legal Rights to Sewage Effluent,
W80-03009 6E

RECREATION
Market Methods of Multiple Use Reconciliation,
W80-03147 6C

REGIONAL ANALYSIS
Experience of Drought in the Sahel Region,
W80-03069 6B

Floods in Puerto Rico, Magnitude and Frequency,
W80-03161 2E

REGRESSION ANALYSIS
Floods in Puerto Rico, Magnitude and Frequency,
W80-03161 2E

Landslide-Prone Soils of Southwestern Pennsylvania,
W80-03190 2G

REGULATION
An Assessment of the On-Site Waste Water Management Program in the State of Maine,
W80-03083 6E

Efficiency in the Use of Water for Irrigation: The Role of Prices and Regulations,
W80-03140 3F

Monopoly-Power as a Means for Pollution-Control.
W80-03148 6C

RELIABILITY
Expressing the Phosphorus Loading Concept in Probabilistic Terms,
W80-03120 5C

REMOTE SENSING
Drought Susceptibility Survey and the Concept of Monitoring Landscape Ecology,
W80-03065 6B

RENOVATION
Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

RESEARCH AND DEVELOPMENT
Groundwater: New Directions--Where We've Been and Where We're Going,
W80-03037 2F

RESEARCH EQUIPMENT
Effect of Ammonium Chloride on Predatory Consumption Rates of Brook Trout (Salvelinus Fontinalis) on Juvenile Chinook Salmon (Oncorhynchus Tshawytscha) in Laboratory Streams,
W80-03292 5C

RESEARCH PRIORITIES
Executive Summary: Workshops on Technological Aspects,
W80-03135 6D

RESERVOIR OPERATION
Techniques for Real-Time Operation of Flood Control Reservoirs in the Merrimack River Basin,
W80-03198 6B

RESOURCE ALLOCATION
Uncertainty and Allocation Decisions Involving Unique Environmental Resources,
W80-03146 6B

RESPIRATION
An Electromyogram of the Mandibular Adductor of the Intact Baikal Grayling, Thymallus Arcticus Baicalensis, in a Phenol Solution,
W80-03247 5C

Ventilation Frequency Compensation Responses of Three Eurythermal Estuarine Fish Exposed to Moderate Temperature Increases,
W80-03262 5C

REVIEWS
Progress in Analytical Groundwater Modeling,
W80-03053 2F

Ground-Water Tracers--A Short Review,
W80-03187 2F

RIO GRANDE BASIN (CO)
Water Resources Data for Colorado, Water Year 1978--Volume 1. Missouri River Basin, Arkansas River Basin, and Rio Grande Basin.
W80-03149 7C

RISKS
Uncertainty and Allocation Decisions Involving Unique Environmental Resources,
W80-03146 6B

RIVER FLOW
Willamette River Sediment Management Possibilities: Phase I -- Problem Clarification,
W80-03008 2J

Winter Ice Jams on the Gunnison River,
W80-03100 2C

RIVER REGULATION
Techniques for Real-Time Operation of Flood Control Reservoirs in the Merrimack River Basin,
W80-03198 6B

RIVERS
Quality of Rivers of the United States, 1975 Water Year--Based on the National Stream Quality Accounting Network (NASQAN),
W80-03154 7C

RIVERSIDE COUNTY (CA)
Water-Resources Data, 1970-75, for Perris Valley and Vicinity, Riverside County, California,
W80-03156 7C

ROCKS
Time-Dependent Sorption on Geological Materials,
W80-03045 5B

ROSTHERNE MERE
Notes on the Phytoplankton Periodicity of Rostherne Mere, Cheshire, 1967-1977,
W80-03116 5C

ROUTING
Effects of Parameter Uncertainty in a Flow Routing Model,
W80-03035 2E

RUBIDIUM
Trace Elements in Pelagic Organisms and a Pelagic Foodchain of the Aegean Sea,
W80-03229 5A

Pollution Monitoring of Eleven Trace Elements in Three Marine Organisms from Saronikos Gulf, Greece,
W80-03230 5A

Heavy Metals and Chlorinated Hydrocarbons in Pelagic Organisms from the Open Mediterranean Sea,
W80-03241 5A

RUNOFF
A Mini-Guide to the Water Resources of Botswana,
W80-03063 2A

Effects of Grazing on Runoff and Sediment Yield from Desert Rangeland at Badger Wash in Western Colorado, 1953-73,
W80-03166 4C

Estimating Micro-Relief Surface Storage from Point Data,
W80-03179 2E

Simulating Nutrient Movement and Transformations with the Arm Model,
W80-03180 5B

Evaluation of TVA Streamflow Model on Small Kentucky Watersheds,
W80-03182 2E

Tillage System Effects on Sediment and Nutrients in Runoff from Small Watersheds,
W80-03183 5B

The Evaluation of a Hydrodynamic Watershed Model (IHW Model IV), a Contribution to the International Hydrological Decade,
W80-03206 2A

RURAL AREA
Some Aspects of Management-Rural Water Systems,
W80-03134 6B

Executive Summary: Workshops on Technological Aspects,
W80-03135 6D

RURAL AREAS
Toward a National Program for Rural Water-Sewer Development: The Basic Issues,
W80-03125 6E

Rural Water: State Programs,
W80-03127 6B

Rural Water: State-Federal Relationships,
W80-03128 6E

Assuring Adequate Supply: Quantity and Quality,
W80-03129 6D

Alternative Water Supply Systems in Rural Areas,
W80-03130 6B

Alternatives for Wastewater Treatment in Rural Areas,
W80-03131 5D

The Economics of Rural Water Supply,
W80-03132 6B

Legal Problems Facing Rural Domestic Water Users,
W80-03133 6E

Executive Summary: Workshops on Socio-Economic Aspects,
W80-03136 6C

RURAL SOCIOLOGY
Drought in the Sahel: A Broader Interpretation, With Regard to West Africa and Ethiopia,
W80-03068 6B

Providing Rural Water: Constraints and Impacts,
W80-03126 6B

RURAL WATER SYSTEMS
The Impacts of Rural Water Systems in North Carolina: An Exploratory Study.
W80-03003 6C

SAHEL
Drought in the Sahel: A Broader Interpretation, With Regard to West Africa and Ethiopia,
W80-03068 6B

SALINE WATER
Impact of Delta Outflow Upon Salinity and Waterfowl in the Suisun Marsh,
W80-03099 2L

SALINITY
Ground-Water Salinity Problems Related to Irrigation in the Colorado River Basin,
W80-03189 5G

Effect of Environmental Salinity of Haemolymph and Tissues of Mussels,
W80-03222 5A

SALMON CREEK BASIN (WA)
Benthic Invertebrates, Periphyton, and Bottom Material and Their Trace-Metal Concentrations in Salmon Creek Basin, Clark County, Washington,
W80-03162 5B

SALMONELLA
Salmonella Sp. Harbored by Aquatic Fauna as Indices of Fecal Pollution,
W80-03173 5A

SALVINIA
Concentration of the Herbicide 2,4-D by Some Higher Water Plants,
W80-03243 5B

SAMPLING
Diatom and Chrysophycean Cyst Profiles in Sediment Cores from Two Linked But Contrasting Welsh Lakes,
W80-03101 5C

SAN JUAN RIVER BASIN
Water Resources Data for Colorado, Water Year 1978--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W80-03151 7C

SANDS
Effects of Stem Density Upon Sediment Retention by Salt Marsh Cordgrass, Spartina Alterniflora Loisel,
W80-03026 4D

SARDINA
Mercury Concentrations in Pelagic Fishes (Anchovy, Mackerel and Sardine) from the Italian Coast and Strait of Gibraltar,
W80-03236 5A

SCALLOPS
Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

SCANDIUM
Heavy Metals and Chlorinated Hydrocarbons in Pelagic Organisms from the Open Mediterranean Sea,
W80-03241 5A

SCHEFFERVILLE (QUEBEC)
Characteristics of Subarctic Snowcover,
W80-03034 2C

SCOMBER
Mercury Concentrations in Pelagic Fishes (Anchovy, Mackerel and Sardine) from the Italian Coast and Strait of Gibraltar,
W80-03236 5A

SEALS
Organochlorines and Metals in Harbour Seals (Dutch Wadden Sea),
W80-03280 5B

SEASONAL
Seasonal Changes in the Standing Crop of an Epilithic Algal Population on the North Shore of Great Slave Lake,
W80-03112 5C

SECONDARY PRODUCTIVITY
Biological Basis for Assessing Impacts of Channel Modification: Invertebrate Production, Drift, and Fish Feeding in a Southeastern Blackwater River,
W80-03078 6B

SEDIMENT CONTROL
Willamette River Sediment Management Possibilities: Phase I -- Problem Clarification,
W80-03008 2J

An Improved Sediment Delivery Model for Piedmont Forests,
W80-03081 4D

Filtration of Sediment by Simulated Vegetation II. Unsteady Flow with Non-Homogeneous Sediment,
W80-03177 4D

SEDIMENT TRANSPORT
Effects of Dam Removal: An Approach to Sedimentation,
W80-03204 2J

SEDIMENT YIELD
Effects of Grazing on Runoff and Sediment Yield from Desert Rangeland at Badger Wash in Western Colorado, 1953-73,
W80-03166 4C

SEDIMENTOLOGY
Diatom and Chrysophycean Cyst Profiles in Sediment Cores from Two Linked But Contrasting Welsh Lakes,
W80-03101 5C

SEDIMENTS
Effects of Stem Density Upon Sediment Retention by Salt Marsh Cordgrass, Spartina Alterniflora Loisel,
W80-03026 4D

Soil Sediment Deposits in Subsurface Drains,
W80-03178 4A

Tillage System Effects on Sediment and Nutrients in Runoff from Small Watersheds,
W80-03183 5B

Heavy Metals in the Sediments of the Gulf of Bothnia,
W80-03295 5A

SELENIUM
Trace Elements in Pelagic Organisms and a Pelagic Foodchain of the Aegean Sea,
W80-03229 5A

Pollution Monitoring of Eleven Trace Elements in Three Marine Organisms from Saronikos Gulf, Greece,
W80-03230 5A

Trace Elements in Mesopelagic and Some Coastal Fish from the Adriatic,
W80-03233 5A

Concentrations of Arsenic, Selenium and Ten Heavy Metals in School Shark, Galeorhinus Australis (Macleay), and Gummy Shark, Mustelus Antarcticus Gunther, from South-Eastern Australian Waters,
W80-03285 5A

Selenium Toxicity to Daphnia Magna, Hyallela Azteca, and the Fathead Minnow in Hard Water,
W80-03294 5A

SENSITIVITY ANALYSIS
A Sensitivity Analysis of the Penman-Monteith Actual Evapotranspiration Estimates,
W80-03036 2D

SEPARATION TECHNIQUES
Floating Oil Skimmer,
W80-03143 5G

Apparatus for Treating Metal Containing Waste Waters,
W80-03265 5D

Method for the Separation from Each Other of the Components of a Mixture of Water, Oil and Dirt (Sludge) as Well as Apparatus for Performing Said Method,
W80-03274 5D

SEPTIC TANK EFFLUENT
Design of a Subsurface Waste Disposal System with Biological Denitrification,
W80-03174 5D

SEPTIC TANKS
Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

A Study of the Efficiency of Septic Tank Effluent Treatment in Two Raised Bed Systems,
W80-03085 5E

Outlet for Septic Tanks,
W80-03273 5D

SEWAGE BACTERIA
A Resonance Raman Method for the Rapid Detection, Identification and Quantitation of Bacteria in Sewage and Natural Waters,
W80-03087 5A

SEWAGE DISPOSAL
Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

SEWAGE EFFLUENTS
Legal Rights to Sewage Effluent,
W80-03009 6E

Utilization of Municipal Sewage Effluent and Sludge on Forest and Disturbed Land.
W80-03089 6G

Effect of Spray Irrigation of Treated Municipal Sewage Effluent on the Accumulation and Decomposition of the Forest Floor,
W80-03090 6G

Effect of Municipal Wastewater Irrigation on the Physical Properties of the Soil,
W80-03091 6G

Effects of Municipal Wastewater Irrigation on Wildlife and Wildlife Habitat,
W80-03092 6G

Sewage Effluent and Liquid Digested Sludge as Aids to Revegetation of Strip Mine Spoil and Anthracite Coal Refuse Banks,
W80-03093 3C

Planktonic Systems and Urban Pollution: Study of Plankton Populations, (In French).
W80-03212 5C

Diatoms and Water Quality in Lowland Streams in the Province of Northern Brabant (The Netherlands),
W80-03275 5C

SEWAGE TREATMENT
A Study of the Efficiency of Septic Tank Effluent Treatment in Two Raised Bed Systems,
W80-03085 5E

Process for the Separation of Cadmium (CD++) Ions from Sewage, Waste Water and Aqueous Solutions,
W80-03270 5D

Outlet for Septic Tanks,
W80-03273 5D

SEWERAGE
Toward a National Program for Rural Water-Sewer Development: The Basic Issues,
W80-03125 6E

SHARKS
Concentrations of Arsenic, Selenium and Ten Heavy Metals in School Shark, Galeorhinus Australis (Macleay), and Gummy Shark, Mustelus Antarcticus Gunther, from South-Eastern Australian Waters,
W80-03285 5A

SHORES
Monitoring the Effect of Oil Pollution on Rocky Seashores,
W80-03015 5C

SHRIMP
Influence of Crude Oil and Detergents on the Concentration of some Ions in Hemolymph of the Shrimp Crangon Crangon L. and the Crab Rhithropanopeus Harrisi Gould,
W80-03277 5B

Purification and Properties of Soluble Arylsulphatases Isolated from Hepatopancreas of the Shrimp Crangon Crangon L.
W80-03278 5A

SILVER
Pollution Monitoring of Eleven Trace Elements in Three Marine Organisms from Saronikos Gulf, Greece,
W80-03230 5A

Heavy Metals and Chlorinated Hydrocarbons in Pelagic Organisms from the Open Mediterranean Sea,
W80-03241 5A

SIMULATION ANALYSIS
The Simulation of Transmissivity, Storativity and Evapotranspiration in a Digital Model of a Fissured Dolomite Aquifer Near Ndola, Zambia,
W80-03033 2F

A Discrete Model for the Study of a Lake,
W80-03106 5C

Management of Water Resources - A Co-Operative Game-Theoretic Approach to Inter-State Problems,
W80-03142 6A

Flow Routing in the Susquehanna River Basin: Part II Low-Flow Frequency Characteristics of the Susquehanna River Between Waverly, New York and Sunbury, Pennsylvania,
W80-03163 6A

SIPHONS
Connector Wells, A Mechanism for Water Management in the Central Florida Phosphate District,
W80-03041 4B

SLUDGE DISPOSAL
Sewage Effluent and Liquid Digested Sludge as Aids to Revegetation of Strip Mine Spoil and Anthracite Coal Refuse Banks,
W80-03093 3C

SLURRIES
Slurry Flow in Pipe Networks,
W80-03193 8B

SMALL BUSINESSES
Financing Your Pollution Control Needs,
W80-03145 6C

SNOW
World Data Center A for Glaciology (Snow and Ice), New Accessions List No. 4.
W80-03208 2C

SNOWPACKS
Characteristics of Subarctic Snowcover,
W80-03034 2C

SOCIAL ADJUSTMENT
Some Sociological Aspects of Drought,
W80-03066 2B

SOCIAL ASPECTS
Providing Rural Water: Constraints and Impacts,
W80-03126 6B

Executive Summary: Workshops on Socio-Economic Aspects,
W80-03136 6C

SOCIAL CHANGE
Some Sociological Aspects of Drought,
W80-03066 2B

SOCIAL IMPACT
Providing Rural Water: Constraints and Impacts,
W80-03126 6B

SOCIAL MOBILITY
The Traditional Response to Drought in Botswana,
W80-03067 2A

SOCIAL VALUES
The Traditional Response to Drought in Botswana,
W80-03067 2A

SOCIALIST COUNTRIES
The Economics of the Eastern Block Ocean Policy,
W80-03138 6E

SOIL GASES
Seasonal Chemical and Isotopic Variations of Soil CO2 at Trout Creek, Ontario,
W80-03047 2F

SOIL MANAGEMENT
Impacts of Off-Road Vehicles on Infiltration and Sediment Production of Two Desert Soils,
W80-03057 2J

SOIL MECHANICS
Impacts of Off-Road Vehicles on Infiltration and Sediment Production of Two Desert Soils,
W80-03057 2J

SOIL MOISTURE
Model Development for Predicting Soil Moisture by Thermography,
W80-03007 7B

SOIL PHYSICAL PROPERTIES
Effect of Municipal Wastewater Irrigation on the Physical Properties of the Soil,
W80-03091 6G

SOIL PROFILES
Landslide-Prone Soils of Southwestern Pennsylvania,
W80-03190 2G

SOIL SURFACES
Estimating Micro-Relief Surface Storage from Point Data,
W80-03179 2E

SOIL WATER MOVEMENT
Sorption of Water in Soils: A Comparison of Techniques for Solving the Diffusion Equation,
W80-03192 2G

SOILS
Evaluation of Mound Systems for Renovation of Septic Tank Effluent,
W80-03001 8D

SOLAR RADIATION
Solar Energy Collectors and Plants Operated by Them,
W80-03225 3A

SOLE
Polycyclic Aromatic Hydrocarbon Carcinogens in Commercial Seafoods,
W80-03252 5A

SOLEA
Effect of Dissolved Petroleum Products on Carbohydrate Metabolism of the Liver of Two Black Sea Species of Fishes,
W80-03223 5B

SORPTION
Time-Dependent Sorption on Geological Materials,
W80-03045 5B

Sorption of Phosphate by Danish Lake Sediments,
W80-03102 5C

Sorption of Water in Soils: A Comparison of Techniques for Solving the Diffusion Equation,
W80-03192 2G

SOUTH-COASTAL PUERTO RICO
Water Budget and Hydraulic Aspects of Artificial Recharge, South Coast of Puerto Rico,
W80-03160 4B

SOUTH DAKOTA
Rural Water: State Programs,
W80-03127 6B

SOUTHEAST MINNESOTA
Hydrologic Data for Floods of July 1978 in Southeast Minnesota and Southwest Wisconsin,
W80-03158 2E

SOUTHEAST U.S.
Evaluation Techniques of Fractured-Rock Hydrology,
W80-03049 2F

SOUTHWEST WISCONSIN
Hydrologic Data for Floods of July 1978 in Southeast Minnesota and Southwest Wisconsin,
W80-03158 2E

SPATIAL DISTRIBUTION
Spatial Variability of Phytoplankton Biomass in the Surface Waters of Long Island,
W80-03104 5C

Accumulation and Distribution of Heavy Metals in Some Marine Organisms in the Bay of Izmir and in Aegean Coasts,
W80-03239 5A

SPECTROPHOTOMETRY
Enhancement of Luminol Chemiluminescence with Halide Ions,
W80-03094 5A

SPECTROSCOPY
A Resonance Raman Method for the Rapid Detection, Identification and Quantitation of Bacteria in Sewage and Natural Waters,
W80-03087 5A

SPICARA
Effect of Dissolved Petroleum Products on Carbohydrate Metabolism of the Liver of Two Black Sea Species of Fishes,
W80-03223 5B

SPOT
Ventilation Frequency Compensation Responses of Three Eurythermal Estuarine Fish Exposed to Moderate Temperature Increases,
W80-03262 5C

SPRAY IRRIGATION
Effect of Spray Irrigation of Treated Municipal Sewage Effluent on the Accumulation and Decomposition of the Forest Floor,
W80-03090 6G

Effect of Municipal Wastewater Irrigation on the Physical Properties of the Soil,
W80-03091 6G

Effects of Municipal Wastewater Irrigation on Wildlife and Wildlife Habitat,
W80-03092 6G

SPRINKLER IRRIGATION
Water Requirements for Urban Lawns,
W80-03002 3D

ST. LAWRENCE ESTUARY
ATP as a Measure of Living Phytoplankton Carbon in Estuaries,
W80-03115 5C

ST LAWRENCE RIVER BASIN (OHIO)
Water Resources Data for Ohio, Water Year 1978--Volume 2. St. Lawrence River Basin.
W80-03153 7C

STANDING CROPS
Seasonal Changes in the Standing Crop of an Epilithic Algal Population on the North Shore of Great Slave Lake,
W80-03112 5C

STATE GOVERNMENTS
Toward a National Program for Rural Water-Sewer Development: The Basic Issues,
W80-03125 6E

STORATIVITY
The Simulation of Transmissivity, Storativity and Evapotranspiration in a Digital Model of a Fissured Dolomite Aquifer Near Ndola, Zambia,
W80-03033 2F

STORM RUNOFF
Urban Stormwater Control Package for Automated Real-Time Systems,
W80-03080 4A

STREAM EROSION
Assessing Impacts of Land Management Activities on Erosion-Related Nonpoint Source Problems,
W80-03113 5B

STREAMFLOW
Flow Routing in the Susquehanna River Basin: Part II Low-Flow Frequency Characteristics of the Susquehanna River Between Waverly, New York and Sunbury, Pennsylvania,
W80-03163 6A

Unsteady Streamflow Modeling Guidelines,
W80-03167 2E

Evaluation of TVA Streamflow Model on Small Kentucky Watersheds,
W80-03182 2E

Nutrient Loads in Streamflow from Sandy Soils in Florida,
W80-03184 5B

A Simplified Model for the Generation of Daily Streamflows,
W80-03195 2E

STREAMFLOW DATA
A Simplified Model for the Generation of Daily Streamflows,
W80-03195 2E

STREAMFLOW FORECASTING
A Simplified Model for the Generation of Daily Streamflows,
W80-03195 2E

STREAMS
Quality of Rivers of the United States, 1975 Water Year--Based on the National Stream Quality Accounting Network (NASQAN),
W80-03154 7C

STRIP MINES
The Impacts of Coal Strip Mining on the Hydrogeologic System of the Northern Great Plains: Case Study of Potential Impacts on the Northern Cheyenne Reservation,
W80-03042 5B

Hydrologic Considerations in Decision Analyses for Reclaiming Strip Mine Land in the Southwest,
W80-03176 4A

STRONTIUM RADIOISOTOPES
Some Observations on the Reproduction and Embryonic Development of Five Species of Fish Kept in Experimental Radioactive Water Bodies,
W80-03244 5A

On the Correspondence of Data on the Incubation of Fish Eggs in Solutions of Strontium-90 -- Yttrium-90 of Varying Activity Under Laboraroty Conditions and in Natural Waters,
W80-03250 5A

SUBSURFACE DRAINAGE
Groundwater Flow Systems in the Western Phosphate Field in Idaho,
W80-03055 2F

SUBSURFACE DRAINS
Soil Sediment Deposits in Subsurface Drains,
W80-03178 4A

SUBSURFACE WATER
Method for Preventing the Contamination of Subsoil Water from Products Deposited on the Ground or in Underground Cavities,
W80-03025 5G

SUCCESSION
Notes on the Phytoplankton Periodicity of Rostherne Mere, Cheshire, 1967-1977,
W80-03116 5C

SULFUR
Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

SUNFISHES
Initial Testing of a Recent Biological Monitoring Concept,
W80-03221 5A

SURFACE WATERS
Water Resources Data for Colorado, Water Year 1978--Volume 1. Missouri River Basin, Arkansas River Basin, and Rio Grande Basin.
W80-03149 7C

Water Resources Data for Colorado, Water Year 1978--Volume 2. Colorado River Basin Above Dolores River.
W80-03150 7C

Water Resources Data for Colorado, Water Year 1978--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W80-03151 7C

Water Resources Data for Ohio, Water Year 1978--Volume 1. Ohio River Basin.
W80-03152 7C

Water Resources Data for Ohio, Water Year 1978--Volume 2. St. Lawrence River Basin.
W80-03153 7C

SURGES
Computer Simulation of Storm Surges and River Flooding in Mobile Bay,
W80-03088 2L

SURVEYS
Systematic Surveys and Monitoring in Nearshore Sublittoral Areas Using Diving,
W80-03016 5C

SUSQUEHANNA RIVER BASIN (PA)
Flow Routing in the Susquehanna River Basin: Part II Low-Flow Frequency Characteristics of the Susquehanna River Between Waverly, New York and Sunbury, Pennsylvania,
W80-03163 6A

SWAMPS
Importance of a Bordering Wetland for Chemical Properties of Lake Water,
W80-03169 5B

SYNOPTIC ANALYSIS
Southern African Rainfall: Past, Present and Future,
W80-03061 2B

SYSTEMS ANALYSIS
Techniques for Real-Time Operation of Flood Control Reservoirs in the Merrimack River Basin,
W80-03198 6B

Potential Use of Digital Computer Ground Water Models,
W80-03202 2F

Design of Flood Control Improvements by Systems Analysis: A Case Study,
W80-03203 2E

TECHNOLOGY
Outdoor Algal Mass Cultures--I. Applications,
W80-03105 5G

TEMEPHOS
Sub-Lethal Effects of the Organophosphate Black Fly Larvicide, Abate (Temephos) on Sarotherodon Mossambicus (Peters),
W80-03261 5C

TEMPERATURE
Effects of Nutrients and Temperature on Decomposition of Myriophyllum Spicatum L. in a Hard-Water Eutrophic Lake,
W80-03119 5C

TERATOGENS
Some Observations on the Reproduction and Embryonic Development of Five Species of Fish Kept in Experimental Radioactive Water Bodies,
W80-03244 5A

The Effect of Chemical Mutagens on the Spermatozoa of the Silver Carp, Hypophthalmichthys Molitrix, and the Bighead, Aristichthys Nobilis,
W80-03249 5C

Effects of Crude Oil on the Development of the Shell of Mytilus edulis (L) (Mytilidae, Bivalvia), (In French),
W80-03284 5B

TEST WELLS
Geothermal Well Testing,
W80-03039 2F

TEXAS
Tidal Dynamics and Low-Frequency Exchanges in the Aransas Pass, Texas,
W80-03027 2L

Occurrence, Quality, and Quantity of Ground Water in Wilbarger County, Texas,
W80-03209 7C

THALASSIA
Relationship Between Productivity and N2 (C2H2) Fixation in a Thalassia Testudinum Community,
W80-03124 5C

THEORETICAL ANALYSIS
Theoretical and Experimental Study of Wind- and Wave-Induced Drift,
W80-03031 5B

THERMAL STRESS
The Problem of Drought in Botswana,
W80-03058 6B

Ventilation Frequency Compensation Responses of Three Eurythermal Estuarine Fish Exposed to Moderate Temperature Increases,
W80-03262 5C

THERMAL WATER
Geothermal Well Testing,
W80-03039 2F

THERMODYNAMIC BEHAVIOR
A Study of the Distribution of Mercury in the Various Compartments of the North Sea and Scheldt Estuary Ecosystems,
W80-03213 5A

THUNDERSTORMS
Hydrologic Data for Floods of July 1978 in Southeast Minnesota and Southwest Wisconsin,
W80-03158 2E

THYMALLUS
An Electromyogram of the Mandibular Adductor of the Intact Baikal Grayling, Thymallus Arcticus Baicalensis, in a Phenol Solution,
W80-03247 5C

TIBBEE RIVER (MS)
Design of Flood Control Improvements by Systems Analysis: A Case Study,
W80-03203 2E

TIDAL WATERS
Tidal Dynamics and Low-Frequency Exchanges in the Aransas Pass, Texas,
W80-03027 2L

TIDES
A Variable-Depth Green's Function for Shelf Edge Tides,
W80-03030 2L

TILE DRAINS
Soil Sediment Deposits in Subsurface Drains,
W80-03178 4A

TISSIUE ANALYSIS
Sub-Lethal Effects of the Organophosphate Black Fly Larvicide, Abate (Temephos) on Sarotherodon Mossambicus (Peters),
W80-03261 5C

TISSUE ANALYSIS
Effects of Abrupt Change in Water Quality on Rainbow Trout (Salmo Gairdneri Rich.),
W80-03210 5A

A Study of the Distribution of Mercury in the Various Compartments of the North Sea and Scheldt Estuary Ecosystems,
W80-03213 5A

Effect of Environmental Salinity of Haemolymph and Tissues of Mussels,
W80-03222 5A

Effect of Dissolved Petroleum Products on Carbohydrate Metabolism of the Liver of Two Black Sea Species of Fishes,
W80-03223 5B

Monitoring of Chlorinated Hydrocarbons in Biota of the North and Middle Adriatic Coastal Waters,
W80-03226 5B

Levels of Metal Pollutants in Sediments and Biota of the Gulf of Trieste: A Long Term Survey,
W80-03228 5A

Trace Elements in Pelagic Organisms and a Pelagic Foodchain of the Aegean Sea,
W80-03229 5A

Pollution Monitoring of Eleven Trace Elements in Three Marine Organisms from Saronikos Gulf, Greece,
W80-03230 5A

Trace Metals and Organochlorine Residue Content of Mullidae Family Fishes and Sediments in the Vicinity of Erdemli (Icel), Turkey,
W80-03231 5A

Trace Elements in Mesopelagic and Some Coastal Fish from the Adriatic,
W80-03233 5A

Mercury Concentrations in Pelagic Fishes (Anchovy, Mackerel and Sardine) from the Italian Coast and Strait of Gibraltar,
W80-03236 5A

Monitoring of Chlorinated Hydrocarbons in Biota and Sediments of South Adriatic Coastal Waters,
W80-03238 5A

Accumulation and Distribution of Heavy Metals in Some Marine Organisms in the Bay of Izmir and in Aegean Coasts,
W80-03239 5A

Heavy Metals and Chlorinated Hydrocarbons in Pelagic Organisms from the Open Mediterranean Sea,
W80-03241 5A

Concentration of the Herbicide 2,4-D by Some Higher Water Plants,
W80-03243 5B

Some Observations on the Reproduction and Embryonic Development of Five Species of Fish Kept in Experimental Radioactive Water Bodies,
W80-03244 5A

Hydrocarbon Characteristics of the Organs and Tissues of Some Marine Fishes from the Mediterranean,
W80-03248 5B

Physiological-Biochemical Data on Experimental Intoxication of Fish with 'Yalan',
W80-03251 5A

Polycyclic Aromatic Hydrocarbon Carcinogens in Commercial Seafoods,
W80-03252 5A

Assimilation Efficiency of Dietary Methylmercury by Northern Pike (Esox Lucius),
W80-03253 5A

Accumulation and Excretion of 95Zr and 95Nb by Common Goby (Acanthogobius Flavimanus),
W80-03256 5A

Bioavailability of a Hydrocarbon from Water and Sediment to the Marine Worm Arenicola Marina,
W80-03260 5B

Uptake and Cellular Distribution of Cadmium in Mytilus Edulis,
W80-03263 5B

Preliminary Results on Uptake and Elimination at Different Temperatures of p,p'-DDT and Two Chlorobiphenyls in Perch from Brackish Water,
W80-03268 5A

Heavy Metals (Hg, Cd, Cu, Pb, Zn) in Liver and Muscle Tissue of Fresh-Water Perch (Perca Fluviatilis) of the Lake of Biel and the Walensee (In German),
W80-03269 5A

Influence of Crude Oil and Detergents on the Concentration of some Ions in Hemolymph of the Shrimp Crangon Crangon L. and the Crab Rhithropanopeus Harrisi Gould,
W80-03277 5B

Purification and Properties of Soluble Arylsulphatases Isolated from Hepatopancreas of the Shrimp Crangon Crangon L.
W80-03278 5A

Activity of Liver Fructose 1,6 Biphosphatase in Rainbow Trout Held in Different Concentrations of Indissociated Ammonia (In Italian),
W80-03279 5B

Organochlorines and Metals in Harbour Seals (Dutch Wadden Sea),
W80-03280 5B

Isolation and Elemental Analysis of Metal-Rich Granules from the Kidney of the Scallop, Pecten Maximus (L.),
W80-03282 5A

Effects of Crude Oil on the Development of the Shell of Mytilus edulis (L) (Mytilidae, Bivalvia), (In French),
W80-03284 5B

Concentrations of Arsenic, Selenium and Ten Heavy Metals in School Shark, Galeorhinus Australis (Macleay), and Gummy Shark, Mustelus Antarcticus Gunther, from South-Eastern Australian Waters,
W80-03285 5A

Combined Effects of Cadmium, Copper and Lead on Developing Herring Eggs and Larvae,
W80-03286 5A

Lead Toxicosis and Salt Glands in Domestic Ducks,
W80-03287 5B

Mercury, DDE, and PCBs in Eggs from a Norwegian Gannet Colony,
W80-03288 5A

Identification of Chlordanes and Related Compounds in Goby-Fish from Tokyo Bay,
W80-03290 5A

A Possible Physiological Uptake Mechanism of Methylmercury by the Marine Bloodworm (Glycera Dibranchiata),
W80-03293 5A

Toxic Effects and Accumulation of Cadmium in Some Benthic Organisms of the Baltic,
W80-03297 5A

The Cytochemical Distributions of Zinc (Zn II) and Iron (Fe III) in the Common Mussel, Mytilus Edulis, and Their Relationship with Lysosomes,
W80-03299 5B

A Light Microscopic Study of the Action of Sodium Orthovanadate on the Gills of Fresh-

Water and Sea-Water Eels (Anguilla Anguilla L.),
W80-03300 5B

TOXICITY
Planktonic Systems and Urban Pollution: Study of Plankton Populations, (In French).
W80-03212 5C

Toxicity Testing in the United Kingdom for the Evaluation of Oil Slick Dispersants,
W80-03214 5A

Acute Aquatic Toxicity and Dispersing Effectiveness of Oil Spill Dispersants: Results of a Canadian Oil Dispersant Testing Program (1973 to 1977),
W80-03215 5A

Effect of a Chemical Dispersant on Microbial Utilization of Petroleum Hydrocarbons,
W80-03216 5A

Effects of Dispersant Use on Shore Life,
W80-03217 5C

Ecological Effects of Dispersants in the United Kingdom,
W80-03218 5B

Effect of Dissolved Petroleum Products on Carbohydrate Metabolism of the Liver of Two Black Sea Species of Fishes,
W80-03223 5B

Some Observations on the Reproduction and Embryonic Development of Five Species of Fish Kept in Experimental Radioactive Water Bodies,
W80-03244 5A

An Electromyogram of the Mandibular Adductor of the Intact Baikal Grayling, Thymallus Arcticus Baicalensis, in a Phenol Solution,
W80-03247 5C

The Effect of Chemical Mutagens on the Spermatozoa of the Silver Carp, Hypophthalmichthys Molitrix, and the Bighead, Aristichthys Nobilis,
W80-03249 5C

Physiological-Biochemical Data on Experimental Intoxication of Fish with 'Yalan',
W80-03251 5A

Diatoms and Water Quality in Lowland Streams in the Province of Northern Brabant (The Netherlands),
W80-03275 5C

Influence of Crude Oil and Detergents on the Concentration of some Ions in Hemolymph of the Shrimp Crangon Crangon L. and the Crab Rhithropanopeus Harrisi Gould,
W80-03277 5B

Activity of Liver Fructose 1,6 Biphosphatase in Rainbow Trout Held in Different Concentrations of Indissociated Ammonia (In Italian),
W80-03279 5B

Effect of Long-Term Lead Exposure on the Seawater and Sediment Bacteria from Heterogeneous Continuous Flow Cultures,
W80-03283 5A

Effects of Crude Oil on the Development of the Shell of Mytilus edulis (L) (Mytilidae, Bivalvia), (In French),
W80-03284 5B

Combined Effects of Cadmium, Copper and Lead on Developing Herring Eggs and Larvae,
W80-03286 5A

Lead Toxicosis and Salt Glands in Domestic Ducks,
W80-03287 5B

Effect of Ammonium Chloride on Predatory Consumption Rates of Brook Trout (Salvelinus Fontinalis) on Juvenile Chinook Salmon (Oncorhynchus Tshawytscha) in Laboratory Streams,
W80-03292 5C

Selenium Toxicity to Daphnia Magna, Hyallela Azteca, and the Fathead Minnow in Hard Water,
W80-03294 5A

Hydroids in Biotest: Clava Multicornis Exposed to Cadmium,
W80-03296 5A

Toxic Effects and Accumulation of Cadmium in Some Benthic Organisms of the Baltic,
W80-03297 5A

Review of Experiments on the Chronic Toxicity Exerted by Some Pollutants on Animal Species from the Bay of Gdansk,
W80-03298 5A

A Light Microscopic Study of the Action of Sodium Orthovanadate on the Gills of Fresh-Water and Sea-Water Eels (Anguilla Anguilla L.),
W80-03300 5B

TRACE ELEMENTS
Benthic Invertebrates, Periphyton, and Bottom Material and Their Trace-Metal Concentrations in Salmon Creek Basin, Clark County, Washington,
W80-03162 5B

Trace Elements in Pelagic Organisms and a Pelagic Foodchain of the Aegean Sea,
W80-03229 5A

Pollution Monitoring of Eleven Trace Elements in Three Marine Organisms from Saronikos Gulf, Greece,
W80-03230 5A

Trace Elements in Mesopelagic and Some Coastal Fish from the Adriatic,

Regional Carbonate Flow Systems in Nevada,
W80-03050 2F

NEVADA UNIV. SYSTEM, RENO. DESERT RESEARCH INST.
The Meinzer Era of U.S. Hydrogeology, 1910-1940,
W80-03054 2F

NEVADA UNIV. SYSTEM, RENO. RENEWABLE NATURAL RESOURCES DIV.
Impacts of Off-Road Vehicles on Infiltration and Sediment Production of Two Desert Soils,
W80-03057 2J

NEVADA UNIV. SYSTEM, RENO. WATER RESOURCES CENTER.
Time-Dependent Sorption on Geological Materials,
W80-03045 5B

NEVADA UNIV. SYSTEM, RENO. WATER RESOURCES CENTER; AND NEVADA UNIV. SYSTEM, RENO. DEPT. OF CIVIL ENGINEERING.
Unsteady Streamflow Modeling Guidelines,
W80-03167 2E

NEW YORK STATE COLL. OF AGRICULTURE AND LIFE SCIENCES, ITHACA. ECOLOGY AND SYSTEMATICS SECTION.
Nutrient Budgets of a Temporary Pond Ecosystem,
W80-03123 5C

NORTH CAROLINA UNIV. AT CHAPEL HILL. CENTER FOR URBAN AND REGIONAL STUDIES.
The Impacts of Rural Water Systems in North Carolina: An Exploratory Study.
W80-03003 6C

NORTH CAROLINA UNIV. AT CHAPEL HILL. DEPT. OF ECONOMICS.
Uncertainty and Allocation Decisions Involving Unique Environmental Resources,
W80-03146 6B

NORTH CAROLINA UNIV. AT CHAPEL HILL. DEPT. OF ENVIRONMENTAL SCIENCE AND ENGINEERING.
Methods for the Assessment of Aqueous Organic Materials,
W80-03006 5A

NORTH DAKOTA ASSOCIATION OF REC'S, AND RTC'S, MANDAN.
Rural Water: State Programs,
W80-03127 6B

NORTH DAKOTA STATE SENATOR, SOLEN.
Rural Water: State-Federal Relationships,
W80-03128 6E

NORTH DAKOTA STATE UNIV., FARGO. DEPT. OF BOTANY.
Forest Overstory Vegetation and Environment on the Missouri River Floodplain in North Dakota,
W80-03168 2I

NORTHERN RESEARCH INST. OF HYDRAULIC ENGINEERING AND LAND RECLAMATION, KAZAN RECLAMATION, KAZAN (USSR). DEPT. OF HYDROLOGY AND WATER RESOURCES.
Environmental Influences on the Development of Oil-Decomposing Microorganisms,
W80-03245 5E

NUKLEARNI INST. JOZEF STEFAN, LJUBLJANA (YUGOSLAVIA).
Trace Elements in Mesopelagic and Some Coastal Fish from the Adriatic,
W80-03233 5A

ODESSA STATE UNIV. (USSR).
Effect of Chlorophos and Hexachlorane on Cell Cultures of Warm-Blooded and Cold-Blooded Animals,
W80-03242 5C

OFFICE OF RADIATION PROGRAMS, LAS VEGAS, NV.
Utility of a Computerized Data Base for Hydrogeologic Investigations, Las Vegas Valley, Nevada,
W80-03051 2F

OKLAHOMA STATE UNIV., STILLWATER. SCHOOL OF BIOLOGICAL SCIENCES.
Biological and Water Quality Effects of Artificial Mixing of Arbuckle Lake, Oklahoma, During 1977,
W80-03170 5C

OREGON STATE DEPT. OF ENVIRONMENTAL QUALITY, PORTLAND.
Assessing Impacts of Land Management Activities on Erosion-Related Nonpoint Source Problems,
W80-03113 5B

OREGON STATE UNIV., CORVALLIS. DEPT. OF FISHERIES AND WILDLIFE.
Effects of Municipal Wastewater Irrigation on Wildlife and Wildlife Habitat,
W80-03092 6G

Effect of Ammonium Chloride on Predatory Consumption Rates of Brook Trout (Salvelinus Fontinalis) on Juvenile Chinook Salmon (Oncorhynchus Tshawytscha) in Laboratory Streams,
W80-03292 5C

OREGON STATE UNIV., CORVALLIS. WATER RESOURCES RESEARCH INST.
Willamette River Sediment Management Possibilities: Phase I -- Problem Clarification,
W80-03008 2J

OSLO UNIV. (NORWAY). INST. OF ZOOLOGY.
Eutrophication, Minute Algae and Inefficient Grazers,
W80-03211 5B

PENNSYLVANIA STATE UNIV., UNIVERSITY PARK. DEPT. OF AGRONOMY.
Landslide-Prone Soils of Southwestern Pennsylvania,
W80-03190 2G

PENNSYLVANIA STATE UNIV., UNIVERSITY PARK. INST. FOR RESEARCH ON LAND AND WATER RESOURCES.
Effect of Spray Irrigation of Treated Municipal Sewage Effluent on the Accumulation and Decomposition of the Forest Floor,
W80-03090 6G

Effect of Municipal Wastewater Irrigation on the Physical Properties of the Soil,
W80-03091 6G

Sewage Effluent and Liquid Digested Sludge as Aids to Revegetation of Strip Mine Spoil and Anthracite Coal Refuse Banks,
W80-03093 3C

PISA UNIV. (ITALY). CATTEDRA PATOLOGIA GENERALE COMPARATA.
Lead Toxicosis and Salt Glands in Domestic Ducks,
W80-03287 5B

PURDUE UNIV., LAFAYETTE, IN. WATER RESOURCES RESEARCH CENTER.
Salmonella Sp. Harbored by Aquatic Fauna as Indices of Fecal Pollution,
W80-03173 5A

QUEBEC UNIV., RIMOUSKI. DEPT. OF OCEANOGRAPHY.
ATP as a Measure of Living Phytoplankton Carbon in Estuaries,
W80-03115 5C

REGIONAL CENTRE FOR TRAINING AND APPLICATION OF AGROMETEOROLOGY AND OPERATIONAL HYDROLOGY, NIAMEY (NIGER).
Experience of Drought in the Sahel Region,
W80-03069 6B

SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
JUL 29 1981
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 13, NUMBER 10
MAY 15, 1980

W80-03301 -- W80-03600
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the
Office of Water Research and Technology
U.S. Department of the Interior

VOLUME 13, NUMBER 10
MAY 15, 1980

W80-03301 -- W80-03600

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most our our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographic citation and a set of identifiers or descriptors which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Office of Water Research and Technology.

To provide SWRA with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

The input from these Centers, and from the 54 Water Resources Research Institutes administered under the Water Research and Development Act of 1978, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies becomes the information base from which this journal is derived.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology

Washington, D.C. 20240

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

PROCESS FOR CATALYTIC PHOTO-OXIDATION OF WATER,
National Research Development Corp., London (England). (Assignee).
A. Harriman, and G. Porter.
US Patent No 4,176,026, 12 p, 3 Fig, 3 Tab, 2 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1039, November 27, 1979.

Descriptors: *Patents, *Solar radiation, *Oxidation, Energy conversion, Light, Water treatment, Oxygen, Chemical reactions, Manganese, Photooxidation, Chemical fuel.

The object of the invention is to provide a process by means of which visible light can be used to photo-oxidise water into oxygen and in which the electrons which are released from the water in such a process are captured by an electron acceptor to form a compound which acts as a store of energy and which may subsequently be used as, or converted to, a chemical fuel. The process comprises irradiating with light in the visible region of the spectrum a solution comprising water, a manganese (II) or manganese (III) complex of formula MnL wherein L is a phthalocyanine ligand, a 5, 10, 15, 20--tetraphenylporphyrin ligand or a 5, 10, 15, 20--tetrapyridylporphyrin ligand, and a suitable electron acceptor. The process results in the oxidation of water into oxygen and the reduction of the electron acceptor. The reduced electron acceptor may be used as, or converted to, a chemical fuel. (Sinha-OEIS)

METHOD OF GENERATING HYDROGEN AND OXYGEN FROM WATER,
Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). (Assignee)
H. Barnert, J. Divisek, and W. Faul.
U.S. Patent No 4,175,013, 6 p, 1 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 988, No 3, p 692, November 20, 1979.

Descriptors: *Patents, *Chemical reactions, *Electrolysis, Gases, Hydrogen, Oxygen, Electrolytes, Organic compounds.

A method of generating oxygen and hydrogen from water is described in which an acidic electrolyte containing formaldehyde is electrolyzed and produces oxygen and a gas which contains a low molecular-weight hydrocarbon. The low molecular-weight hydrocarbon is subjected to a catalytic conversion with water to produce synthesis gas consisting predominantly of hydrogen and carbon monoxide which are reacted to yield methanol. The methanol, in turn, is reacted to produce formaldehyde which is introduced into the electolysis itself and hydrogen which is recovered. (Sinha-OEIS)

DETERMINING PEAK-DISCHARGE FREQUENCIES IN AN URBANIZING WATERSHED--A CASE STUDY,
Corps of Engineers, Detroit, MI. Detroit District.
S. F. Daly, and J. Peters.
Hydrologic Engineering Center, Davis, California, Technical Paper No 64, July 1979. 13 p, 12 Fig, 4 Tab, 12 Ref.

Descriptors: *Urbanization, *Urban hydrology, *Peak discharge, *Michigan, Hydrograph analysis, Frequency analysis, Frequency curves, Flood recurrence interval, Unit hydrographs, Watersheds(Basins), Analytical techniques, Analysis, Infiltration, Runoff, Rainfall-runoff relationships, Computer models, *Red Run Drain(MI), Case study, Ungaged area, Impervious surfaces.

A case study was presented of a hydrologic investigation of the Red Run Drain-Lower Clinton River watershed, an area near Detroit, Michigan, that has undergone urbanization since the 1940s. The purpose of the study was to determine peak-discharge frequencies at gaged and ungaged locations for existing and future conditions. Population density was used as an indicator of urbanization in relationships defining unit hydrograph parameters and hydrologically significant impervious area. Input parameters for a single event rainfall-runoff simulation model (HEC-1) were developed to reflect watershed conditions in the years 1940, 1950, 1960, and 1975. The input parameters were verified by reconstructing observed flood events that occurred at these points in time. Sets of synthetic winter and summer storm hyetographs were input to HEC-1 to develop a series of curves for two gaging stations that relate peak discharge to magnitude of synthetic storm for each watershed condition. The curves were used to transform the series of recorded annual peak discharges at each gage to a stationary series that reflects 1975 watershed conditions. Discharge frequency estimates were then developed for ungaged locations using winter and summer synthetic storms that were assigned exceedance frequencies consistent with actual exceedance frequencies at the gaged locations. Projections of future population density were the basis for developing HEC-1 input parameters representing years 2000 and 2025 watershed conditions. Estimates of peak discharge-frequencies for the future conditions were made at the gaged and ungaged locations using the methods described above. (Humphreys-ISWS)
W80-03349

FLOOD HYDROGRAPH AND PEAK FLOW FREQUENCY ANALYSIS,
Hydrologic Engineering Center, Davis, CA.
A. D. Feldman.
Technical Paper No 62, March 1979. 19 p, 4 Fig, 1 Tab, 37 Ref.

Descriptors: *Hydrograph analysis, *Peak discharge, *Watersheds(Basins), *Floods, Analytical techniques, Hydrographs, Model studies, Frequency analysis, Streamflow forecasting, Flood frequency, Hydrologic systems, Runoff, Ungaged areas.

This paper addressed the practical state of the art of techniques to predict flood peaks and their associated frequency of occurrence, and techniques for predicting critical flood hydrographs (or series of hydrographs) and their frequencies of occurrence. Statistical relationships, empirical equations, and watershed models were investigated as means for predicting the peak discharges and flood hydrographs. In general, the larger or more complex the drainage system becomes, the more the analysis shifts from predicting peaks to predicting the whole hydrograph. The techniques addressed in this paper were separated into the following categories: (1) frequency analysis of historical streamflows, (2) statistical equations, (3) empirical formulae, (4) single event watershed models, and (5) continuous watershed models. (Humphreys-ISWS)
W80-03350

TESTING OF SEVERAL RUNOFF MODELS ON AN URBAN WATERSHED,
Hydrologic Engineering Center, Davis, CA.
J. Abbott.
Technical Paper No 59, October 1978. 50 p, 15 Fig, 11 Tab, 15 Ref.

Descriptors: *Urban runoff, *Model studies, *California, *Watersheds(Basins), Computer models, Storm runoff, Routing, Hydrographs, Discharge(Water), Storm water, Management, Calibrations, Surface runoff, Hydrologic aspects, Hydrology, Unit hydrographs, Monthly, Analytical techniques, Castro Valley Watershed(CA), Urban watersheds, Daily runoff.

Six models, plus two variants of one and a variant of another, were tested with the objective of making a preliminary evaluation of their relative capabilities, accuracies, and ease of application. For four of the models, plus two variants of one of them, the primary performance criterion was the degree to which simulated values matched observed daily and monthly runoff volumes for the 5.5-square mile Castro Valley Watershed near Oakland, California. In addition, tests were performed for several individual runoff events for all six models. The results showed that each model could be calibrated on a single set of data and verified with acceptable accuracy on a different data set. The ease of application was decidedly different for all models, due to the differing level of detail in input data required. Going from the simplest to most difficult to apply, the continuous models rank as follows: STORM, HEC-1C, SSARR, and HSP. Similar ranking of the single-event models is: HEC-1, SWMM, and MITCAT. Also, a recent capability added to the STORM model (i.e., SCS procedures for computing runoff and routing) produced more accurate results than the coefficient method of computing quantity of runoff incorporated in the original version of STORM. These limited tests were not intended to serve as a basis for comparison of the accuracy of the various models. However, they did show that the more complex models did not produce better results than the simple models for the Castro Valley Watershed data. (Humphreys-ISWS)

LAND-USE AND UPLAND WATER RESOURCES IN BRITAIN--A STRATEGIC LOOK,
Institute of Hydrology, Wallingford (England).
I. R. Calder, and M. D. Newson.
Water Resources Bulletin, Vol 15, No 6, p 1628-1639, December 1979. 4 Fig, 3 Tab, 41 Ref.

Descriptors: *Forest watersheds, *Rainfall disposition, *Interception, *Water yield, Runoff, Reservoirs, Water supply, Water resources, Evaporation, Evapotranspiration, Watersheds(Basins), Forests, Vegetation establishment, Land use, On-site investigations, Mathematical models, Model studies, Hydrology, *England.

Recent results from the Institute of Hydrology's hydrometeorological and hydrological studies on

water use by forest and grassland confirm earlier predictions of a reduction in water yields following afforestation. This reduction is due primarily to the increased interception losses from forests. This paper showed how the water yield from uplands is related to the relative proportions of land under forest and hill farming, and estimated how water yields will change if a greater proportion of hill land is afforested. SCIENTIFIC ASPECTS OF THE 1975-76 DROUGHT IN ENGLAND AND WALES,
For primary bibliographic entry see Field 2E.
W80-03444

SOME DETAILED WATER BALANCE STUDIES OF RESEARCH CATCHMENTS,
Institute of Hydrology, Wallingford (England).
R. T. Clarke, and M. D. Newson.
In: Scientific Aspects of the 1975-76 Drought in England and Wales; Proceedings of a Royal Society Discussion Meeting held on October 28, 1977. p 21-42, 1978. 6 Fig, 7 Tab.

Descriptors: *Demonstration watershed, *Water balance, *Water yield, *Droughts, Forest watersheds, Agricultural watersheds, On-site investigations, Data collections, Water levels, Vegetation effects, Groundwater, Soil moisture, Evaporation, Rainfall, Watersheds(Basins), Hydrology, Foreign research, Land use, Precipitation(Atmospheric), Analysis, Streamflow, Aquifers, Discharge(Water), *England, *Wales.

Aspects of the water balance during the drought period 1975-76 were reported for the Institute of Hydrology's experimental catchments in Cumbria, East Anglia, the Thames Valley, and upland Wales. Summer (April-September) and winter (October-March) totals of precipitation, streamflow, and potential evaporation during the drought were compared with mean values for seasons preceding it; where soil moisture was measured by neutron probe, losses from actual evaporation were also compared. Yield dropped proportionately less in relation to rainfall where catchments contained appreciable storage, such as the Cam catchment in East Anglia with its chalk-glacial drift aquifer, or the Wye and Severn catchments in upland Wales which contain storage areas of peat underlain with glacial drift. The stream draining the Oxford clay of the Ray catchment in the Thames valley, on the other hand, dried up entirely in the second summer of the drought. The paper suggested that the comparison of water yields from the Wye and Severn catchments, which are under hill pasture and coniferous forest respectively, gives results which have considerable bearing on the future management of water resources from upland areas when the aim of management is to maintain supplies of water even during periods of drought as extreme as the years 1975-76. The effect on reservoir operation of neglecting to allow for change in land use is illustrated by a hypothetical example using an artificial 30-year streamflow sequence containing a drought year with very long return period. (See also W80-03444) (Humphreys-ISWS)
W80-03446

THE EFFECTS OF DROUGHT ON THE RIVER SYSTEMS,
Birmingham Univ. (England). Dept. of Water Engineering.
M. J. Hamlin, and C. E. Wright.
In: Scientific Aspects of the 1975-76 Drought in England and Wales; Proceedings of a Royal Society Discussion Meeting held on October 28, 1977. p 69-96, 1978. 10 Fig, 9 Tab, 15 Ref.

Descriptors: *Droughts, *River systems, *Watersheds(Basins), *Mathematical models, Runoff, Rainfall, Streamflow, Streamflow forecasting, Statistical methods, Analytical techniques, Rivers, Evaporation, Foreign research, Data collections, Frequency analysis, Hydrographs, Low-flow frequency, Low flow, Reservoir storage, Moisture deficit, Model studies, *England, *Wales, Watershed characteristics.

The drought of 1975-76 had a significant effect on the river systems of England and Wales and will be used in water resources design for many years. It is therefore important to recognize that for the river flows it was not uniformly severe. Further, for many purposes, the duration of the low flow is at least as important as its severity. As an example, for the river Thames at Teddington it was only for periods of one and two months that the flow in 1976 was lower than that in 1921. The paper reviewed the conditions that give rise to low flows in rivers, compared a representative set of low flow records, commented on criteria that were used to reduce the effect of the drought on the quantity and quality of river flows, and suggested methods by which the management of rivers in time of drought might be improved. What is necessary is to present the information in terms that show clearly the consequences of particular courses of action given clearly stated probabilities of future rainfall or river flows. This will enable logical decisions to be taken. This may be attempted in one of three ways: the use of data generation techniques, the use of rainfall statistics where these are easier to obtain than adequate river flow data, or the use of flow records where they are of sufficient length to permit realistic statistical analysis. The use of rainfall statistics, if it is possible to derive a satisfactory rainfall runoff model, gives the most promising method and warrants further research and development. CURRENT SUBSURFACE INTRUSION OF MEDITERRANEAN SEAWATER--A POSSIBLE SOURCE OF GROUNDWATER SALINITY IN THE RIFT VALLEY SYSTEM, ISRAEL,
Geological Survey of Israel, Jerusalem.
U. Kafri, and A. Arad.
Journal of Hydrology, Vol 44, No 3/4, p 267-287, December 1979. 8 Fig, 2 Tab, 42 Ref.

Descriptors: *Saline water, *Groundwater resources, *Chemical properties, *Saline water-freshwater interfaces, *Geohydrologic units, Groundwater, Aquifer systems, Isotope studies, Mixing, Geochemistry, Paleohydrology, Geologic history, Sea water, Saline water intrusion, *Galilee(Israel), *Israel, Flushing.

Various theories have been put forward regarding the salination mechanism in the Jordan-Dead Sea Rift Valley and its branching valleys. None of these has suggested current subsurface seawater penetration to the internally drained Judea Group aquifer as a part of the system. The hydrogeological configuration is a combination of a low water table and a rather low groundwater divide, resulting in a shallow sea-fresh water interface. In most of the area the interface is expected to be situated above the base of the aquifer. As a result, current seawater intrusion is possible across the groundwater divide through the Yizre'el and Beersheva valleys which dissect Israel and connect the Mediterranean and the Jordan-Dead Sea Rift Valley. The model suggested herein is in accordance with, or cannot be rejected on the basis of, the chemistry and isotope composition of the saline waters. In the highly flushed aquifers of the internal valleys, brackish water with marine affinity suggests current infiltration of seawater. This mechanism is additional to other sources, such as deep seated, highly concentrated brines and entrapped fossil seawater, all of which are diluted by the flow of cyclic freshwaters. (Adams-ISWS)

The ionic composition, stable isotope, and total salinity pattern of waters from the aquifer of the Kurnub and 'Arad groups (Lower Cretaceous-Jurassic) suggest that these waters replaced previous formation brines. The hydrologic regime which caused the flushing is the same as that which filled the Kurnub Group aquifer ('Upper Nubian Sandstone') of the central and southern Negev. Infiltration took place during humid phases of the Pleistocene, through outcrops along the igneous massif of the southern Sinai. Northward, subsurface flow was made possible mainly by the opening of outlet zones along the regional faults accompanying the Syrian-African rift system. The layers beneath the Coastal Plain were not flushed as no outlet was available due to the deep burial of these layers under a thick impermeable cover of the Shefela and Saqiye groups. Alternative models by other authors (Mesozoic and Recent flushing) are briefly discussed. (Adams-ISWS)

HYDROMETEOROLOGICAL MODEL FOR STREAMFLOW PREDICTION,
Geological Survey, Tacoma, WA. Water Resources Div.
W. V. Tangborn.
Available from: OFSS U.S. Geological Survey Box 25425, Federal Center Denver, CO microfiche $3.50 paper copy $12.00. Geological Survey open-file report 79-741, 1979. 88 p, 11 Fig, 7 Tab, 3 Ref, 9 Append.

Descriptors: *Streamflow forecasting, *Model studies, *Hydrology, *Meteorology, *Washington, Hydrologic data, Methodology, On-site data collections, Water storage, River basins, Rainfall-runoff relationships, Snowmelt, *North Cascades region(Wash).

The hydrometeorological model described in this manual was developed to predict seasonal streamflow from water in storage in a basin using streamflow and precipitation data. The model, as described, applies specifically to the Skokomish, Nisqually, and Cowlitz Rivers, in Washington State, and more generally to streams in other regions that derive seasonal runoff from melting snow. Thus the techniques demonstrated for these three drainage basins can be used as a guide for applying this method to other streams. Input to the computer program consists of daily averages of gaged runoff of these streams, and daily values of precipitation collected at Longmire, Kid Valley, and Cushman Dam. Predictions are based on estimates of the absolute storage of water, predominately as snow: storage is approximately equal to basin precipitation less observed runoff. A pre-forecast test season is used to revise the storage estimate and improve the prediction accuracy. To obtain maximum prediction accuracy for operational applications with this model, a systematic evaluation of

several hydrologic and meteorologic variables is first necessary. Six input options to the computer program that control prediction accuracy are developed and demonstrated. Predictions of streamflow can be made at any time and for any length of season, although accuracy is usually poor for early-season predictions (before December 1) or for short seasons (less than 15 days). The coefficient of prediction (CP), the chief measure of accuracy used in this manual, approaches zero during the late autumn and early winter seasons and reaches a maximum of about 0.85 during the spring snowmelt season. WATER RESOURCES OF THE NISQUALLY LAKE AREA, PIERCE COUNTY, WASHINGTON,
Geological Survey, Tacoma, WA. Water Resources Div.
H. E. Pearson, and N. P. Dion.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-300 953, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-101, May 1979. 34 p, 6 Fig, 7 Tab, 20 Ref.

Descriptors: *Groundwater resources, *Surface-groundwater relationships, *Model studies, *Groundwater availability, *Streams fisheries, Chemical analysis, Water temperature, Data collections, Discharge measurements, Hydrologic cycle, Glacial drift, Till, Water quality, Drilling, Test wells, Bathymetry, Washington, *Nisqually Lake area(Wash), *Pierce County(WA), Fort Lewis, Nisqually Indian Reservation.

This report presents data on the water resources of an area within, and adjacent to a part of the Fort Lewis Military Reservation, Wash., that prior to 1917 was included in the Nisqually Indian Reservation. The only surface-water bodies of significance in the study area are Muck Creek and Nisqually Lake. A large spring also is in the study area. Development or diversion of Muck Creek near its mouth would provide sufficient water for a small to medium sized fish-rearing facility. The highest water temperature recorded during the 25 months of data collection was 14C in August 1977 for Muck Creek. Nisqually Lake has a surface area of about 89 acres and is shallow with a flat bottom. Species of warm-water fish are probably best suited for the lake. Ground water occurs in unconsolidated glacial drift or outwash of gravel, sand, silt, and clay. Drilling of test wells is required to provide more reliable data on yields of ground water. (Kosco-USGS)

Descriptors: *Biogeography, *Migrations, *Sahara, *Mali, *Paleoclimatology, History, Social aspects, Rural sociology, Model studies, Droughts, Water supply, Africa.

Pastoral peoples of the Saharan and Sahel zones of West Africa have been subjected to fluctuating environmental conditions since the introduction of domestic animals into North Africa c. 7000 P.B. The present paper attempts to create a dynamic model of the palaeoenvironmental situation in the Sahel and, from archaeological data excavated in the Tilemsi Valley, Mali, offers an example of human response to these fluctuating conditions which illustrated how these people responded to drought by always moving south into better-watered areas. Expansion of the pastoral way of life in the Sahara before 6500 P.B. is postulated to have been tied closely to annual precipitation and evapotranspiration. Increasing instability in this dynamic equilibrium by 4500 B.P., however, is thought to have precipitated the decision to migrate to where sufficient water and pasturage would be available. Colonization is further postulated to have been due to a number of other coincident factors, including a gradual southward movement of the savanna zone and the concomitant retreat of the Tsetse belt. TEXAS HIPLEX INTERIM PROGRESS REPORT FOR APRIL 1 - SEPTEMBER 30, 1979.
Texas Dept. of Water Resources, Austin. Planning and Development Div.
Report No LP-110, December 1979 Prepared for the Bureau of Reclamation, Office of Atmospheric Resources Management. 138 p, 10 Fig, 14 Tab, 2 Append.

Descriptors: *Weather modification, *Cloud seeding, *Texas, *Precipitation(Atmospheric), Cloud physics, Climatology, Satellites(Artificial), Data collections, Climatic data, Artificial precipitation, Synoptic analysis, Meteorological data, Weather data, High Plains Cooperative Program.

An evaluation of the 1979 operation season is presented along with a continued description of 1976-1978 operations for the Texas HIPLEX Project (High Plains Cooperative Program). The project, begun in 1974 by the Bureau of Reclamation Office of Atmospheric Resources Management and the Texas Water Development Board, is designed to establish a verified, working technology and operation management framework capable of producing additional rain from cumulus clouds in the semiarid Plains States. Three field research sites are being used and the one evaluated here is the Big Spring-Snyder area of Texas. Cloud and precipitation processes associated with natural and seeded clouds in the area are being studied. Progress reports on mescoscale data evaluation are given along with synoptic climatology development, satellite radiance data analysis, radar data analysis and interpretation, and cloud-sampling with seeding operations. Mesoscale data for 1978 are similar to 1976 and 1977 data. The major parameter determining suitable cloud seeding environment in the area is moisture. A comprehensive satellite imagery and radiance data analysis is being prepared for 1976 through 1978. Digitized M-33 radar tapes data are also being analyzed for later combination with previous years results. (Seigler-IPA)

TEXAS HIPLEX 1979 FIELD OPERATIONS SUMMARY,
Texas Dept. of Water Resources, Austin.
W. O. Alexander, and R. F. Riggio.
Report No LP-112, January 1980. 398 p, 5 Tab, 1 Append.

Descriptors: *Texas, *Weather modification, *Weather data, *Cloud seeding, Cloud physics, Meteorology, Precipitation(Atmospheric), Rain, Weather forecasting, Aircraft, Application equipment, High Plains Cooperative Program(HIPLEX).

Daily summaries of 1979 Texas HIPLEX (High Plains Cooperative Program) Field Program are provided for each day from May 21 through July 20 in chronological order. Summary tables are presented for the 1979 Texas HIPLEX field season, aircraft flight operations, and all Texas HIPLEX related cloud-seeding activities. Information given includes when and where cloud sampling and/or seeding was done and when aircraft, radar, rawisonde, and special surface data were collected. Daily weather summaries are given for the period along with surface and airborne weather observations and equipment status. With each daily weather summary is a log of observed weather conditions generally made hourly from 0800 to 1700 CDT from the Big Spring Meteorological Facility. Aircraft used in the program were two Navajos, one pressurized for cloud seeding, and an Aztec. Silver iodide flares were used for all cloud seeding. Other information given includes an equipment status report and rawisonde and precipitation tables. (Seigler-IPA)

PROBLEMS IN WEIGHTING OF HYETOGRAPHS,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
G. Aron, J. G. Collins, and D. F. Kibler.
Water Resources Bulletin, Vol 15, No 6, p 1556-1564, December 1979. 3 Fig, 2 Tab, 4 Ref.

Descriptors: *Hyetographs, *Isohyets, *Storms, Precipitation(Atmospheric), Weight, Rain gages, Watersheds(Basins), Floods, Rain, Flood flow, *Storm runoff modeling, *Hyetograph weighting, Storm patterns, Rainfall volumes, Precipitation measurement, Thiesson diagram, Isohyetal maps.

The conventional weighting factor application to hyetograph ordinates resulted in artificially attenuated storm patterns. A modified weighting procedure was suggested that allows adjustments in the storm timing, peak intensity, and volume but conserves the storm pattern observed at the rain gage nearest to the watershed point of interest. The systematic underestimation of peak flood flows, which resulted from conventional hyetograph weighting, was avoided by conserving the hyetograph shape from the rain gage nearest to any subarea of a modeled watershed and by merely applying weighting factors to the rainfall volumes and temporal center of gravity of several hyetographs. DETERMINING OVERWATER PRECIPITATION FROM OVERLAND DATA: THE METHODOLOGICAL CONTROVERSY ANALYZED,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
S. J. Bolsenga.
Journal of Great Lakes Research Vol 5, No 3-4, p 301-311, 1979. 3 Fig, 6 Tab, 27 Ref.

Descriptors: *Great Lakes, *Precipitation gages, *Precipitation atmospheric, Snowfall, Rainfall, Limnology, Radar, Remote sensing, Weather patterns, Instrumentation, Towers, Islands, Water levels, Hydrographs, Lakes.

Various methods for measuring or estimating overwater precipitation are examined to determine the usefullness and accuracy of the techniques used. Knowledge of the relationship of land precipitation to lake precipitation is critical in determining overwater precipitation since actual gage measurements of lake precipitation are practically nonexistent. In the past overwater precipitation for large lakes has been estimated by measuring precipitation with gages on islands, towers, or other on lake structures. These measurements are then compared to shoreline measurements and lake/land precipitation ratios are calculated. The ratios are then used to estimate lake precipitation from shore precipitation measurements. However, the validity of such results are now being questioned due to seasonal land lake/land precipitation ratio changes and precipitation gage inaccuracies. Gage inaccuracies or undercatchments result from shielded or unshielded conditions, wind velocity and direction, and differing precipitation forms such as rain, snow, or sleet. Recent tests with accurate gage measurements however, show that lake/land differences are small and monthly differences are statistically insignificant. One solution to gage accuracy problems is the use of radar to measure overwater precipitation. In tests, ratios obtained with radar agree well with actual field data. Suggestions are given for designing a viable accurate method of overwater precipitation determination by initially using radar to determine precipitation ratios. Revised ratios may be needed seasonally or as any change occurs which would alter ratio values. (Seigler-IPA)

THE APPLICATION OF HYDROLOGIC MODELS TO SMALL WATERSHEDS HAVING MILD TOPOGRAPHY,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
E. C. Dickey, J. K. Mitchell, and J. N. Scarborough.
Water Resources Bulletin, Vol 15, No 6, p 1753-1769, December 1979. 5 Fig, 5 Tab, 12 Ref.

Descriptors: *Model studies, *Hydrograph analysis, *Illinois, *Small watersheds, Watersheds(Basins), Hydrology, Simulation analysis, Topography, Shape, Rainfall, Storms, *Hydrologic modeling, SCS model, Hydrograph simulation, Mild topography, Rainfall events, Time rate distribution, Empirical relationships.

This paper evaluated the applicability of hydrologic models described by L.F. Huggins and the Soil Conservation Service to small watersheds by comparing the simulated and actual hydrograph for both gaged and ungaged situations. The annual maximum rainfall events plus storms exceeding 2.5 inches from 25 years of rainfall and runoff data for two small watersheds were selected for the model evaluations. Simulated and actual hydrographs were compared using a parameter that contained volume, peak, and shape factors. One-half of the selected storms were used to calibrate the models. For both models, there were no significant differences between the simulated and actual runoff volumes and peak runoff rates. Parameters obtained during the calibration process and relationships developed to estimate antecedent moisture and to modify tabulated runoff curve numbers were used to simulate the runoff hydrograph from the remaining storms. These remaining storms or test storms were simulated only once in order to imitate an ungaged situation. In general, both the Huggins and Soil Conservation Service models performed similarly on the test storms, but the level of model performance was lower than that for the calibration storms. RECORD TORRENTIAL RAINSTORMS ON THE ISLAND OF HAWAII, JANUARY-FEBRUARY 1979,
Mauna Loa Observatory, Hilo, HI.
R. S. Cram, and H. R. Tatum.
Monthly Weather Review, Vol 107, No 12, p 1653-1662, December 1979. 5 Fig, 4 Tab, 8 Ref.

Descriptors: *Rainfall, *Excessive precipitation, *Precipitation(Atmospheric), *Hawaii, Floods, Flash floods, Storms, Tropical regions, Islands, Precipitation intensity, Weather, Climatology, Meteorology, Torrential rainstorms.

The heaviest and most extensive rainstorms in the history of weather records on the island of Hawaii occurred during the first two months of 1979. Nearly every rainfall record kept by the National Weather Service from the 45 min total through the monthly and two monthly totals was exceeded during January and February 1979. Only twice in the 90-year history of weather records at Hilo have rainfalls of similar magnitude occurred. The most significant characteristic of the 1979 storms is that the record rainfall was produced from warm clouds; clouds whose temperature is everywhere greater than 0C. The February 1979 storm produced rainfalls of 78.2 mm in 1 h and 566.4 mm in 24 h at Hilo from storm clouds with tops below the freezing level. Such rainfall amounts and rates are customarily believed to occur only during thunderstorms, where the cloud tops extend considerably above the freezing level. Thunderstorm activity was absent during the 1979 rainstorms. An account of the January and February 1979 storms and a survey of past record rainfalls on the island of Hawaii were presented. VERY LARGE FLOODS IN THE BRAHMAPUTRA RIVER IN AUGUST 1962, PART I: SYNOPTIC ASPECTS,
Observatory, New Delhi (India).
C. Ramaswamy, and V. S. Rao.
Mausam, Vol 30, No 1, p 9-20, January 1979. 10 Fig, 3 Tab, 10 Ref.

Descriptors: *Floods, *Rainfall, *Monsoons, *Rivers, Precipitation(Atmospheric), Excessive precipitation, Precipitation excess, Runoff, Watersheds(Basins), Winds, Air circulation, Weather, Meteorology, *India, *Brahmaputra River(India).

The large scale synoptic situations from the time of onset of the southwest monsoon to the end of August in 1962 over the catchment of the Brahmaputra (including that of the Tsangpo) were studied using the synoptic charts prepared in India and those published by the Japan Meteorological Agency. Time-sections of the upper winds over Gauhati (26 deg 11 min N, 91 deg 45 min E) and of the heavy rainfall at the India Meteorological Department stations over the Brahmaputra basin were also studied for all important situations. It was shown that the lee-vortices which develop to the southeast of the Tibetan plateau play a very important role in the occurrence of very heavy rainfall over and near Pasighat (28 deg 06 min N, 95 deg 23 min E) in the extreme northeast of Arunachal Pradesh and over the eastern half of the Tsangpo. The conclusion was drawn that frequent and exceptionally heavy rainfall over these areas was predominantly responsible for the phenomenal discharge of the Brahmaputra at Pandu near Gauhati on 24 August 1962. The genesis of the lee-vortices to the southeast of the Tibetan plateau was also discussed. The need for the development of synoptic climatology of the above-mentioned area, with special reference to weather over the Brahmaputra basin, was pointed out. (Sims-ISWS)

2C. Snow, Ice, and Frost

ICE THICKNESS INDICATOR,
D. W. Iwanicki.
US Patent No 4,175,512, 7 p, 8 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 868, November 27, 1979.

Descriptors: *Patents, *Ice, *Water types, Ice cover, Safety, Measurement, Iced lakes, Equipment, Ice thickness.

An ice thickness indicator is placed at the surface of a body of water by floats. It provides a means to indicate whether the water has frozen to a predetermined thickness. The device includes an enclosed chamber which may be filled with water. The chamber is expansible by means of a movable member which partly defines the chamber. The movable member is located below the surface of the water and is connected to an upwardly extending indicator which displays different indications, depending on the relative position of the movable member. As the body of water in which the device is immersed freezes, the water within the expansible chamber also freezes and expands to cause movement of the movable member and operate the indicator. 2D. Evaporation and Transpiration

AN IMPROVED WEIGHING LYSIMETER FACILITY FOR CITRUS EVAPOTRANSPIRATION STUDIES,
Soil and Irrigation Research Inst., Pretoria (South Africa).
G. C. Green, and W. Bruwer.
Water SA, Vol 5, No 4, p 189-195, October 1979. 6 Fig, 7 Ref.

Descriptors: *Lysimeters, *Evapotranspiration, *Citrus fruits, *Water requirements, Moisture uptake, Water utilization, Transpiration, Climatology, Evaporation, Photosynthesis, Soil water movement, Water loss, Diurnal, Orchards, Plant groupings, South Africa.

Three prototype lysimeters installed in a block of Valencia trees, planted in 1963, were used to make detailed and consistent evapotranspiration (ET) measurements for the study of seasonal and daily citrus water relations. All lysimeters contained a single tree for a total mass of approximately 50 tons. The first lysimeter (C) was installed in 1970 and the other two (A and B) were installed in 1972. The steel lysimeter tanks for A and B were contained in concrete-lined pits. To prevent rusting the inner tank surfaces were coated with fiberglass. Some deficiencies in the tank construction were noted such as tank wall bulges. In 1975 an improved measuring system was installed and all three lysimeters were equipped with commercially obtainable precision load cells with a nominal accuracy of 0.02%. Three separate calibration runs were made with one run producing test masses of undisputed accuracy. The lysimeters surpassed general performance expectations with a sensitivity resolution of 2 kg the equivalent of 0.15mm of water over the 13.4 sq m surface area. The lysimeters also showed a good degree of uniformity in ET response. Daily ET totals can be measured within a 10% accuracy in winter and a 3% accuracy in summer. These accurate direct measurements of diurnal transpiration can be used to model the mechanism of water uptake and flow in citrus trees given the high transpiration rates of summer. (Seigler-IPA)

The continuous availability of groundwater to riparian phreatophytic vegetation results in large evapotranspiration losses in summer. Chemical or physical eradication of this vegetation has undesirable environmental effects. Spraying phreatophyte foliage with a nontoxic antitranspirant may reduce transpiration without eradication. Transpiration rate per unit leaf area is similar for several phreatophyte species, but evapotranspiration per unit land area of phreatophytes depends more on stand density than species. The mean for saltcedar evapotranspiration in June was 8.1 mm/day measured by Bowen ratio, compared with 7.9 mm by lysimeters. Growth-retardants reduced transpiration by over 50% in laboratory tests where foliage was thoroughly sprayed. In the field, antitranspirant sprayed by a back-pack mistblower reduced evapotranspiration by 20-35% initially and by 10% after

one month. High cost and spraying difficulties precluded use in 1979. (Roberts-ISWS)
W80-03442

AN ELECTRICAL CONDUCTANCE METHOD FOR DETERMINING CONDENSATION AND EVAPORATION PROCESSES IN ARID SOILS WITH HIGH SPATIAL RESOLUTION,
Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Hanover (Germany, F. R.). Inst Fuer Strahlenbotanik.
C. Bunnenberg, and W. Kuhn.
Soil Science, Vol 129, No 1, p 58-66, January 1980. 8 Fig, 21 Ref.

Descriptors: *Electrical conductance, *Condensation, *Evaporation, *Arid climates, Soil moisture, Laboratory tests, Moisture content, Instrumentation, Soil density, Soil temperature, Dew, Spatial resolution.

This paper described a new instrument developed to measure moisture movements as a result of condensation and evaporation processes in the upper soil layers in laboratory and field experiments. It is based on the well-known method of relating the moisture content of a soil to its electrical conductance. The high spatial resolution of 2 millimeters and the high sensitivity, especially in the dry range, make it a valuable tool for condensation and evaporation studies during the dry season of arid and semi-arid climates, as well as for soil physical investigations of water vapor diffusion. A number of laboratory tests demonstrate the performance of the instrument. (Visocky-ISWS)

EVAPOTRANSPIRATION FROM AN ARID ZONE PLANT COMMUNITY,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
T. W. Sammis, and L. W. Gay.
Journal of Arid Environments, Vol 2, No 4, p 313-321, Dec 1979. 5 Fig, 15 Ref.

Descriptors: *Evapotranspiration, *Water loss, *Desert plants, *Creosotebush, *Model studies, *Desert plants, Plant communities, Lysimeters, Soil-water-plant relationships, Water budget, Southwest U.S.

Total water loss was measured in two ways in a creosotebush community near Tucson, Arizona, with the specific objectives of: (1) measuring evapotranspiration from a typical stand, (2) evaluating the relative importance of the transpiration and evaporation components, and (3) testing and refining a simple diffusion model for estimating transpiration. Primary measurements made through the entire year with a weighing lysimeter at the US/IBP Desert Biome Silverbell Validation Site near Tucson, were used in the water budget method to evaluate evaporation from bare soil plots, and evapotranspiration from a crosotebush community. Additional measurements were made of soil, plant, and climatological data needed to model the transpiration rate from the lysimeter plant and from the surrounding stand. Water losses were found to closely approximate measured precipitation over the year long period, with total losses being 259 mm from the lysimeter, 242 mm from the adjacent bare plots. Transpiration losses estimated from water budgets of bare and vegetated plots were in reasonable agreement with estimates obtained from a simple canopy diffusion model. It was concluded that transpiration losses were a small portion of the total ET due to the high resistence and small leaf area index of the creosotebush canopy, and attemps to control ET by controlling creosotebush or similar desert vegetation will be ineffective. (Tickes-Arizona)

2E. Streamflow and Runoff

FLOOD HAZARD STUDY, LITTLE CALFPASTURE RIVER -- GRASSY RUN, AUGUSTA COUNTY, VIRGINIA.
Soil Conservation Service, Washington, DC.
Prepared in cooperation with the Virginia State Water Control Board, Headwaters Soil and Water Conservation District; and the Augusta County Board of Supervisors, June 1979. 51 p, 17 Fig, 3 Tab, 11 Ref, 1 Append.

Descriptors: *Virginia, *Flood plains, *Flood damage, *Historic floods, Flood forecasting, Hydrology, Flood plain zoning, Flood protection, Tropical cyclones, Thunderstorms, Runoff, Watershed management, Appalachian Mountain Region, Precipitation(Atmospheric), Precipitation excess, Little Calfpasture River.

The flood plain for the Little Calfpasture River and selected tributaries is defined and potential flood losses are identified. The drainage area for the River is 54.8 square miles and is part of the Maury River Subbasin of the James River in the Southern Appalachian Ridges and Valleys physiographic province. Normal annual precipitation is approximately 40 inches of which 19 inches is snowfall. About 80% of the drainage area is forested, about 12% cultivated, and the remaining 8% is comprised of towns and other miscellaneous uses. The flood plain itself has many residences and commercial structures built along the Chesapeake and Ohio Railroad and State Route 42. The flood plain is about 40% cropland; 30% idle brush and woods; 16% pasture; and 14% homes, commercial buildings, and other construction. Several tributaries and Grassy Run were included in the study. In the past tropical storms have caused major floods in the area with the largest reported in June 1949 although no gage records are available. It is estimated to be an 80-year flood which inundated 320 acres of crops and damaged about 30 homes. Due to the steepness of the area excess rainfall concentrates quickly, floods rapidly, and recedes rapidly. With present conditions an extreme flood would inundate about 360 acres with approximately 2 feet of water moving at about 3 feet/second. Sixty-nine buildings on the flood plain have the primary potential for damage. Recommendations are made for the development and implementation of a comprehensive flood plain management program. THE RELATIONSHIP BETWEEN THE TIME BASES OF SIMULATION MODELS AND THEIR STRUCTURE,
Technion-Israel Inst. of Tech., Haifa. Faculty of Civil Engineering.
M. H. Diskin, and E. Simon.
Water Resources Bulletin, Vol 15, No 6, p 1716-1732, December 1979. 6 Fig, 2 Tab, 9 Ref.

Descriptors: *Mathematical models, *Simulation analysis, *Hydrology, *Runoff, Model studies, Analytical techniques, Watersheds(Basins), Semiarid climates, Flow, Annual, Synthetic hydrology, Time base, Optimal parameters.

The time base of a simulation model can be defined as a combination of two time intervals. One is the interval used for input and internal computations. The second is the interval used for the output and calibration of the model. The time base of a model is related, on the one hand, to the type of applications for which the simulated data are used, and on the other hand, to the structure and complexity of the model. The latter may be represented by the number of parameters employed to specify the operation of the model. Using data typical to relatively small watersheds in a semiarid climate, the authors studied the interaction between the complexity of a series of models and the time bases used by them. This included the effects of the two factors, time base and complexity, on the values of the optimal parameters, prediction of mean annual flow, and general performance of the models. The main conclusion was that if the acceptable time base is longer, the model can be less complex needing fewer parameters. There is also an advantage in using a time base comprising a shorter input time interval and a longer output time interval. (Sims-ISWS)

A HYDRAULIC TRANSIENT MODEL OF THE UPPER ST. LAWRENCE RIVER FOR WATER RESOURCES STUDIES,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
A. J. Potok, and F. H. Quinn.
Water Resources Bulletin, Vol 15, No 6, p 1538-1555, December 1979. 8 Fig, 4 Tab, 10 Ref.

Descriptors: *St. Lawrence River, *Lake Ontario, *Great Lakes, *Model studies, Mathematical models, Rivers, St. Lawrence Seaway, Water levels, Flow, River flow, Roughness(Hydraulic), Roughness coefficient, Ice cover, Hydrographs, Theoretical analysis, Hydraulics, Hydrology, Water resources, Water management(Applied), Manning's coefficient.

A one-dimensional hydraulic transient model has been designed for water resource studies of Lake Ontario and the Upper St. Lawrence River. The model simulates water surface profiles and flows in the St. Lawrence River between Lake Ontario and the Moses-Saunders Power Dam under both open water and ice-covered conditions. Errors in water surface elevations were found to be less than 0.2 feet during quasi-steady conditions on the river. Comparable errors occurred during the ice-covered conditions. A sensitivity analysis found the model to be most sensitive to the roughness coefficients and the flow through the power dam. (Sims-ISWS)

PRESENTATION OF LONGITUDINAL DISPERSION DATA,
Liverpool Univ. (England). Dept. of Applied Mathematics and Theoretical Physics.
P. C. Chatwin.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15150, p 71-83, January 1980. 3 Fig, 1 Tab, 25 Ref, 3 Append.

Descriptors: *Dispersion, *Flow, *Model studies, Rivers, Turbulence, Data collections, Estuaries, Hydrology, Water pollution, Equations, Numerical analysis, Analytical techniques, Statistical methods, *Longitudinal dispersion, Edgeworth series, Skewness, Kurtosis, Data analysis.

It was proposed that deviations from Gaussianity of observed profiles of the concentration of a solute in a cloud as it passes the measuring station in a river, estuary, or similar flow should be explicitly measured by recording the nondimensional

skewness and kurtosis. Examples of applications of the proposal were examined. It was shown that observed profiles can be fitted well by Edgeworth series provided the skewness and kurtosis are not too large. Review of the way in which different causes of deviations from Gaussianity can be classified in terms of the evolution of the skewness and kurtosis with downstream position was given, and it was argued that this is the most important point of the proposal. SCIENTIFIC ASPECTS OF THE 1975-76 DROUGHT IN ENGLAND AND WALES,
Proceedings of a Royal Society Discussion Meeting held on October 28, 1977. The Royal Society, London, England, 1978. 133 p.

Descriptors: *Droughts, *Watersheds(Basins), *Conferences, *Hydrology, Demonstration watersheds, Water balance, Agriculture, Groundwater, Aquifers, River systems, Surface waters, Planning, Groundwater resources, Meteorology, Evaporation, Rainfall, Soil moisture, Analytical techniques, Analysis, Crop response, Livestock, Foreign research, Reservoirs, Water quality, Water supply, Moisture deficit, Low flow, Low-flow frequency, Frequency, Water pollution, *England, *Wales.

The drought of 1975-76 was a rare event: the Royal Society discussion meeting about it was unique. The discussion, which is recorded in this volume, was made possible by the great expansion of hydrology in Britain during the past three decades, and the contributors, who had taken part in this expansion, came from government departments, research council institutes, and university departments. Here are the facts about the drought, partly within the historical sequence of such events, and partly in the context of what happened to Britain's near neighbors and of weather elsewhere in the Northern Hemisphere. The wide range of effects is shown in the impact the drought had on experimental catchments; on farming, including crops and stock, pests and diseases; on river behavior and the loads imposed on water resources--surface and underground--and the devices, used or planned, to deal with shortages; and on sewage disposal and other pollution problems. A forward look considers what summer 1976 has to teach in the planning of future development of Britain's water resources. (See also W79-06807 and W80-03445 thru W80-03450) (Humphreys-ISWS)

METEOROLOGICAL ASPECTS OF THE 1975-76 DROUGHT,
R. A. S. Ratcliffe.
In: Scientific Aspects of the 1975-76 Drought in England and Wales; Proceedings of a Royal Society Discussion Meeting held on October 28, 1977, p 3-20, 1978. 13 Fig, 17 Ref.

Descriptors: *Droughts, *Hydrology, *Climatology, *Model studies, Rainfall, Evaporation, Weather, Analysis, Analytical techniques, Meteorology, Moisture deficit, Weather data, Foreign research, Air circulation, Atmospheric pressure, *England, *Wales, Isopleths, Global aspects.

The broad scale meteorological features were examined, and it was shown that the drought was related to a variety of factors, including unusual coldness in the North Pacific Ocean and over Canada in the winter half-year, upper winds stronger than usual in the Central Pacific, and the quasi-biennial oscillation. Feedback mechanisms involving Atlantic sea temperatures and the drought itself helped to maintain the atmospheric mode. The additional evaporation from a reservoir in southern England due to extra sunshine, high summer temperature, etc., was estimated. An attempt was made to put the drought into historical perspective, with the conclusion that it appears to be a rare event rather than a symptom of climatic change. Lastly, by using a Meteorological Office general circulation numerical model, it was shown that a large area of dry ground may inhibit rainfall: the dryness of the ground over Western Europe in the 1976 summer may have had this effect. THE EFFECT OF THE DROUGHT ON BRITISH AGRICULTURE,
National Agricultural Advisory Service, London (England).
E. S. Carter.
In: Scientific Aspects of the 1975-76 Drought in England and Wales; Proceedings of a Royal Society Discussion Meeting held on October 28, 1977. p 43-54, 1978. 8 Tab.

Descriptors: *Droughts, *Agriculture, *Crop production, *Crop response, Foreign research, Farm management, Productivity, Cereal crops, Horticultural crops, Grasslands, Livestock, Wheat, Barley, Oats, Viruses, Potatoes, Sugar beets, Poultry, Milk, *England, *Wales.

The drought was most severe in the south of the country, but had serious effects in all areas. The dry summer of 1975 followed by an unusually dry winter resulted in the majority of the country having a soil moisture deficit in May 1976. Crop production was affected both directly and indirectly through the buildup of certain pests and diseases favored by the weather. Grassland production was severely restricted, and some young leys killed out. Livestock remained remarkably fit, but milk yields fell and lambs and grazing cattle took longer to fatten. Supplementary feeding of hay, straw, and concentrates was necessary. Some cases of poisoning resulted from stock foraging for food where pasture was bare, and poor quality water supplies caused problems. There were losses of sheep, pigs, and calves due to high temperatures. Longer term effects of the drought include an enhanced persistence of soil-acting herbicides and residues. There was a remarkably quick recovery when the rains came. Pastures greened up rapidly and seeds sown under dry conditions germinated giving quite reasonable forage and other crops. The Meteorological Office claim that such a season was one in 500 years. (See also W80-03444) (Humphreys-ISWS)

POLLUTION PROBLEMS ARISING FROM THE 1975-76 DROUGHT,
Anglian Water Authority, Huntingdon (England).
A. W. Davies.
In: Scientific Aspects of the 1975-76 Drought in England and Wales; Proceedings of a Royal Society Discussion Meeting held on October 28, 1977. p 97-107, 1978.

Descriptors: *Droughts, *Water pollution, *Rivers, *Groundwater, Surface waters, Sewerage, Sewage treatment, Water quality, Water supply, Bacteria, Algae, Low flow, Fisheries, Nitrates, *England, *Wales.

The paper considered the gradual transition from the 'normal' quality state of surface waters and groundwaters, and discussed the rapid change in the quality of these waters with the onset of heavy rain towards the end of August 1976. By the end of March 1977 the principal effects of the drought on river water quality had passed, and conditions were close to 'normal' for that time of year. The long term effects of using poor quality water to fill water supply reservoirs cannot be predicted accurately, but it is expected that these waters will present greater treatment difficulties in meeting water supply quality criteria in the future. The effect on groundwater quality may not become apparent for some time. This is particularly so for water abstracted from chalk. The nitrate levels in limestone and gravel waters appear, at the time of writing (September 1977), to have reached the maximum and be decreasing, although some upturn is to be expected on the recharge of these aquifers during the forthcoming winter. It appears unlikely that the problems experienced during the postdrought period will recur unless a very dry summer is followed by an equally wet winter. The effect of the drought on the nitrate levels, particularly in groundwater, was to enhance the upward trend, which evidence available suggests commenced in the early 1950s. In retrospect, had not the drought been followed by very heavy rain, the problems of postdrought quality would have been more severe. The largest single factor which reduced the impact of postdrought pollution was dilution. (See also W80-03444) (Humphreys-ISWS)

PLANNING FOR DEVELOPMENT OF GROUNDWATER AND SURFACE WATER RESOURCES,
Central Water Planning Unit, Reading (England).
O. Gibb, and H. J. Richards.
In: Scientific Aspects of the 1975-76 Drought in England and Wales; Proceedings of a Royal Society Discussion Meeting held on October 28, 1977. p 109-130, 1978. 6 Fig, 3 Tab, 11 Ref.

Descriptors: *Planning, *Droughts, *Water resources development, *Long-term planning, Surface waters, Groundwater resources, Water resources, Foreign research, Aquifers, Rainfall, Streamflow, Data collections, Hydrographs, Water quality, *England, *Wales, Water authorities.

The assessment and development of water resources were considered in relation to present demands and the developed and potential water resources of England and Wales. Normal seasonal changes in storage were compared with those of 1975-76 and conditions during this period compared with previous droughts. There is no basic shortage of water and the extent of restrictions which may have to be applied during drought events is largely determined by the price the consumer is prepared to pay for the safeguard of additional capacity and assured supply. Future trends in water resource planning were summarized as follows: (1) Increasing attention to studies of water use and control of waste with a view to more efficient water use and better forecasts of demand. Control of demand by more effective water-using appliances and the possibility of control by pricing. (2) More detailed hydrological assessments and the design of operating rules with particular attention to the benefits that may be derived from the combined use of different sources. (3) Increasing attention to environmental, amenity, and recreational aspects of water resource developments. (4) More detailed studies of appropriate reliability standards and their implications for the consumer. (5) Increasing attention to quality problems, in particular those associated with reuse of river water containing sewage and industrial effluents. Of these, combined use, reliability, and the quality problems of river-derived supplies were highlighted rather than identified by the 1975-76 drought. (See also W80-03444) (Humphreys-ISWS)

A SYSTEMS MODEL OF STREAM FLOW AND WATER QUALITY IN THE BEDFORD-OUSE RIVER--1. STREAM FLOW MODELLING,

Institute of Hydrology, Wallingford (England).
P. Whitehead, P. Young, and G. Hornberger.
Water Research, Vol 13, No 12, p 1155-1169, 1979. 12 Fig, 1 Tab, 39 Ref.

Descriptors: *Streamflow, *Rainfall-runoff relationships, *Rivers, *Model studies, Mathematical models, Flow, River flow, Time series analysis, Analytical techniques, Rainfall, Precipitation(Atmospheric), Runoff, Hydrographs, Forecasting, Hydrology, *England, *Bedford-Ouse River(England).

This paper, the first of a two part description of the modeling activities associated with the Bedford-Ouse River Study, concentrated on streamflow characterization. The streamflow models are of a stochastic-dynamic type in which a simple lumped parameter differential equation model for mainstream flow is enhanced by stochastic time-series descriptions of rainfall-runoff behavior. The models have been developed using a new systematic approach to the modeling of badly defined dynamic systems which is centered around the exploitation of recursive methods of parameter estimation and time-series analysis. At the same time, the models have quite strong links with more conventional models used previously in hydrological systems analysis, and the implications of the modeling results can easily be interpreted in conventional hydrologic terms. An important aspect of the modeling exercises described in the paper was that they are objective orientated and, in the Bedford-Ouse Study, the models were developed specifically with operational control and management applications in mind. FLOODFLOW CHARACTERISTICS OF BUTTERNUT CREEK AND JAMESVILLE RESERVOIR, JAMESVILLE, ONONDAGA COUNTY, NEW YORK,
Geological Survey, Albany, NY. Water Resources Div.
B. Dunn.
Available from: OFSS U.S. Geological Survey Box 25425, Federal Center Denver, CO microfiche $3.50 paper copy $2.00. Geological Survey open-file report 79-1292, September 1979. 14 p, 5 Fig, 1 Tab, 13 Ref.

Descriptors: *Flood, *Flow characteristics, *Model studies, *Maximum probable flood, *Design flood, Unit hydrographs, Discharge(Water), Dams, Peak discharge, Gaging stations, New York, *Onondaga County(NY), *Butternut Creek(NY), *Jamesville Reservoir(NY), U.S. Army Corps of Engineers, HEC-1 program, Log-Pearson type III analysis.

A hydrologic study of Butternut Creek, near Jamesville, Onondaga County, N.Y., was done to develop inflow and outflow hydrographs of the 'probable maximum flood' and the 'standard project flood' of Jamesville Reservoir, as defined by the U.S. Army Corps of Engineers. The inflow and outflow discharges of the probable maximum flood were computed to be 23,600 and 23,100 cubic feet per second, respectively, and of the standard project flood, 9,400 and 8,800 cubic feet per second, respectively. A rating curve computed for the dam spillway indicates that water-surface elevations produced at the dam by runoff from both the standard project flood and the maximum probable flood would be above the top of the spillway abutments. The 10- and 100-year peak discharges at the Butternut Creek gaging station were computed by the HEC-1 program of the Corps of Engineers to be 2,160 and 3,450 cubic feet, respectively, as compared to 1,680 and 2,810 cubic feet per second computed by a log-Pearson type III analysis of the station data. The HEC-1 values are within the 5- and 95-percent confidence limits of the log-Pearson type III values. (Kosco-USGS)

TYPE 16 FLOOD INSURANCE STUDY: TSUNAMI PREDICTIONS FOR THE WEST COAST OF THE CONTINENTAL UNITED STATES,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
J. R. Houston, and A. W. Garcia.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A063 663, Price codes: A04 in paper copy, A01 in microfiche. Technical Report H-78-26, December 1978. 69 p, 30 Pl, 32 Ref, 1 Append.

Descriptors: *Tsunamis, *Mathematical models, Ocean waves, Coastal flooding, Earthquakes, Pacific Ocean, *Flood insurance, *West coast states, Wave runup.

Calculations of runup due to tsunamis of distant origin were made for most of the west coast of the continental United States. Runup values were determined that were expected to be equaled or exceeded on the average of once per 100 or once per 500 years. Historical data of tsunami activity in distant generation regions were used in the investigation in conjunction with numerical models that generated tsunamis and propagated them across the deep-ocean and nearshore region. The combined effects of astronomical tides and tsunamis were also incorporated into the analysis. Numerical simulations of actual historical tsunamis and comparisons of calculations with tide gage recordings were presented. Calculations of tsunami runup based upon data of local historical tsunamis (at the few locations on the west coast where there was sufficient historical data to allow reasonable predictions) were compared with predictions based upon the methods presented in the investigation. OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME XIV-APPENDIX M, FLOOD CONTROL.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 281, Price codes: A11 in paper copy, A01 in microfiche. Prepared for the Ohio River Basin Coordinating Committee, December 1967. 227 p, 38 Fig, 88 Tab, 25 Photographs.

Descriptors: *Water resources development, *Ohio River Basin, *Multiple purpose projects, *Flood control, *Regional development, *Flood damage, *Flood protection, Flooding, Rivers, Control structures, Reservoirs, Non-structural alternatives, Land use, Planning, Flood plain management, Administration, Resources development, Natural resources, Water policy, Water resources, Peak discharge.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin System, particularly within Ohio, Indiana, West Virginia, Kentucky, Tennessee, and Illinois. The main purposes are to determine the need for further flood control measures and to enhance the economic well being of the Basin. This Appendix discusses present basin flooding problems and future potential problems. Flooding in the Basin is a serious problem and, in spite of a major flood control program, the problems continue to grow. The study area covers 163,000 square miles and has a population of 20 million persons. Current flood control measures include reservoirs, local protection projects, and non-structural measures. Potential solutions to the flood problem include additional development of control and prevention programs in all major sub-basins; more multipurpose reservoirs in sub-area basins; and better upstream land management and treatment which could reduce as much as 10% of flood damages. A potential future flood plan would include both additional upstream and downstream Federal control projects; non-structural measures such as land use regulation; and flood plain studies to identify the magnitude of the flood problem in the Basin. Flood problems and potential solutions are discussed for each of the 19 Ohio River sub-areas and the main stream. The methodology employed in the flood damage studies, the inventories used, and the procedures employed for determining and projecting upstream flood damages are presented. (Arnold-NC)
W80-03569

OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME IV-APPENDIX C, HYDROLOGY.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 272, Price codes: A09 in paper copy, A01 in microfiche. Prepared for the Ohio River Basin Coordinating Committee, August 1966. 197 p, 10 Fig, 32 Tab, 40 Plates, 34 Ref.

Descriptors: *Water resources development, *Ohio River Basin, *Hydrologic studies, *Flood control, *Hydrologic data, *Runoff, *Streamflow, *Multiple purpose projects, *Standard Project Flood, *Floods, *Hydrology, Ice jams, Flood protection, Historic floods, Reservoirs, Flood stages, Flood forecasting, Droughts, Low flow, Sedimentation, Precipitation, Climatology, Meteorology, Watershed(Basins), Control structures.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin System, particularly for that part within Ohio, Indiana, West Virginia, Kentucky, Tennessee, and Illinois. The main purposes are to provide for further flood control measures and to enhance the economic well being of the Basin. This Appendix contains climatologic and hydrologic data for the analysis of water and related land resource problems in the Basin and formulation of a comprehensive framework plan for their solution. The data presented provide a basis for discussion of water problems and solutions contained in other appendices. Data are presented on precipitation and streamflow, magnitudes and frequency of floods and frequency of low flows. Availability of surface water is also estimated. Topography in the Basin is varied from flat and rolling plains to mountains. All major rivers in the Basin have dam and lock systems. Precipitation is distributed throughout the year, although severe droughts have occurred. The flood season is from December through April, with major recent floods occurring in 1963 and 1964. The worst flood occurred in 1937, equalling the Standard Project Flood (SPF) in duration and discharge levels. By 1964 38 reservoirs for flood control had been completed, with 9 others under construction and engineering studies being made for an additional 6. Profiles are presented for the SPF. Flood data are presented for the Basin. (Arnold-NC)

IDENTIFICATION OF AQUIFER PARAMETERS USING NUMERICAL TECHNIQUES,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
S. Neuman, and S. Yakowitz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-143696, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona Project Completion Report (1979), 16 p, 15 Ref, OWRT B-051-ARIZ (3), 14-34-0001-7135.

Descriptors: Groundwater, *Mathematical models, *Aquifer characteristics, Hydrogeology, *Transmissivity, Regression analysis, Numerical analysis, *Water level fluctuations, Arizona, Parameter identification, Numerical methods, Cortaro basin(Ariz).

A new statistically based approach to the problem of estimating spatially varying aquifer transmissivities on the basis of steady state water level and flux data has been developed. The method involves solving either one, or a series of, generalized nonlinear regression problems. When there is a need to solve a series of such problems, the method requires selecting one particular solution from this series by means of a comparative analysis of residuals. A linearlized error analysis of the solution is included. this analysis allows one to estimate the covariance of the transmissivity estimates as well as the square error of the estimates of hydraulic head. In addition to the explicitly statistical orientation of the method, it has an additional feature of permitting the user to incorporate a priori information about the transmissivities. This information may be based on actual field data such as pumping tests, or on statistical data accumulated from similar aquifers elsewhere in the world. The new method has been applied to actual field data from the Cortaro Basin in Southern Arizona. The estimated transmissivities were shown to compare favorably with those obtained earlier for the same basin by an ad hoc trail-and-error procedure. Both sets of transmissivity values have been used successfully in conjunction with a mixed explicit-implicit finite element model to reproduce 25 years of water level variations in the Cortaro Basin in response to pumpage during the period 1940-1965. The finite element model has revealed some important features of the local hydrogeological regime which have not been recognized previously.

GAS CONCENTRATIONS AND AGES OF GROUNDWATERS IN BEAUFORT GROUP SEDIMENTS, SOUTH AFRICA,
Council for Scientific and Industrial Research, Pretoria (South Africa). Natural Isotopes Div.
T. H. E. Heaton, and J. C. Vogel.
Water S. A., Vol 5, No 4, p 160-170, October 1979. 6 Fig, 3 Tab, 38 Ref.

Descriptors: *South Africa, *Groundwater, *Hydrogeology, *Gases, Hydrogen, Helium, Methane, Nitrogen, Oxygen, Water properties, Spectrometers, Chemical analysis, Water sampling, Boreholes, Hydrology, Fractures(Geologic), Fracture permeability.

As part of a geophysical and hydrological study groundwater samples from 25 sites along the 120 km middle-upper stretch of the Orange River in Cape Province and Orange Free State were analyzed for dissolved He, Rn, Ra, CH4, N2, O2, and Ar concentrations and for their 14C and 3H ages. Rocks in the area are part of the Beaufort group. Burial metamorphism of Karoo sediments in the area has produced methane-rich gas and oil traces. Previous hydrological investigations indicate that groundwater age in the area increases with depth, however, the movement and mixing of water along vertical fractures and along contact zones between dikes and sediments is likely. Gas analyses were performed in an Atlas M86 mass spectometer calibrated using atmospheric air and gas mixtures of known composition. Large variations in the concentrations of He and CH4 were found. A correlation between He-CH4 concentrations and the 14C-3H ages of samples was also found. Results indicate that low He and CH4 concentrations characterize young near-surface recently recharged groundwater while high CH4 concentrations characterize deeper older groundwater. The He concentrations in the samples were too high to be accounted for solely by groundwater. The Rn concentrations indicated that the near-surface uranium environment of the different waters is fairly uniform. High N2 and Ar concentrations indicate that excess air may be trapped in the waters during initial infiltration. Old groundwater had low 02 concentrations. (Seigler-IPA)

OVERFLOW TESTS ANALYSED BY THEORETICAL AND NUMERICAL METHODS,
Birmingham Univ. (England). Dept. of Civil Engineering.
K. R. Rushton, and K. S. Rathod.
Ground Water, Vol 18, No 1, p 61-69, January-February 1980. 8 Fig, 6 Ref.

Descriptors: *Water wells, *Artesian wells, *On-site tests, *Theoretical analysis, Overflow, Drawdown, Water yield, Transmissivity, Storage, Storage coefficient, Mathematical models, Numerical analysis, Flow, Discharge(Water), Wells, Water resources, Water supply, Groundwater, Overflow tests.

The assumptions inherent in the theoretical analysis of constant drawdown overflow test are difficult to achieve in practice. This paper showed that, even if there is a restriction in the flow which causes some delay in the achievement of the constant drawdown condition, the theoretical discharge curve is followed once the constant drawdown condition is reached. Recovery tests following overflow were also examined, and it was shown that the discharge used in the calculation should be the discharge at the instant that the test is stopped. Further, it was demonstrated that if well and formation losses occur, the aquifer response is distinctly different from that of the theoretical analysis. A brief description was given of an alternative method of analysis using a numerical model. A preliminary study of a field test yielded promising results. (Sims-ISWS)

THEIS PARAMETER EVALUATION FROM PUMPING TESTS BY SENSITIVITY ANALYSIS,
Geological Survey, Lawrence, KS.
C. D. McElwee.
Ground Water, Vol 18, No 1, p 56-60, January-February 1980. 2 Tab, 14 Ref.

Descriptors: *Groundwater, *Pumping, *Drawdown, *Model studies, Mathematical models, Transmissivity, Storage, Equations, Mathematics, Aquifers, Hydraulic conductivity, Hydrology, Theis equation.

Through the years the Theis equation has played an important role in groundwater hydrology. Comparison of experimental pumping-test data with this theoretical curve by graphic means has been a standard method of determining aquifer transmissivity and storage. The purpose of this paper was to present a technique and an algorithm to fit automatically experimental pumping-test data to the Theis equation by obtaining the 'best' transmissivity and storage in the least squares sense through the use of sensitivity analysis. The automated fit for pumping-test data developed in this work should be a useful tool for the groundwater hydrologist. Use of the technique is simple, quick, and inexpensive, and has the advantage of always being objective. As a measure of the error in fitting, the rms deviation in drawdown was calculated for the 'best' transmissivity and storage. (Sims-ISWS)

RESISTIVITY INVESTIGATIONS FOR GROUND WATER IN METAMORPHIC AREAS NEAR DHANBAD, INDIA,
Indian School of Mines, Dhanbad. Dept. of Applied Geophysics.
R. K. Verma, M. K. Rao, and C. V. Rao.
Ground Water, Vol 18, No 1, p 46-55, January-February 1980. 9 Fig, 7 Ref.

Descriptors: *Groundwater, *Resistivity, *Surveys, On-site investigations, Electrical resistance, Aquifers, Water yield, Water resources, Geology, Rocks, Data processing, Regression analysis, Analytical techniques, Hydrogeology, *India.

Despite sufficient rainfall, large parts of eastern India suffer from water scarcity. Groundwater occurs in weathered or semiweathered/fractured layers in hardrock areas whose thickness varies, in general, from 5 to 20 m. Groundwater studies were carried out in several areas in and around Dhanbad (Lat. 23 deg 48 min N, Long. 86 deg 24 min E) in Bihar State of India. The area covers Precambrian hornblende and feldspathic gneisses, schists, granulites, quartzites, metabasics, and pegmatites. The area forms a part of ENE-WSW trending Satpura orogenic belt. The quartz reefs formed as fault fillings act as barriers to the flow of groundwater. Geophysical investigations, using electrical methods, with Schlumberger configuration using AB up to 300 m, were carried out at most of the locations. Conventional resistivity meters were used for this purpose. The data from 78 Schlumberger soundings were analyzed. Both A and H type curves were obtained. Spectra of resistivity values were prepared to study the overall variation of resistivity values in the area. It was observed that the curves with arithmetic mean values are quite representative. The values obtained from spectral and regression analyses are nearly the same. The results of geoelectric soundings were compared with the geological section wherever available. It was inferred that the thickness of the weathered layer as deduced from Schlumberger soundings includes partly the unweathered/fractured layer as well. An attempt was made to find an empirical relationship between the daily yield of water in gallons/day and the longitudinal conductance (s = h/rho) of the weathered layer. Two empirical relationships were obtained, one for the winter months, December-January, and the other for the summer months, June-July. A suitable explanation for the two curves was given. (Sims-ISWS)
W80-03358

MODEL FOR ESTIMATING ELECTRIC MACROANISOTROPY COEFFICIENT OF AQUIFERS WITH HORIZONTAL AND VERTICAL FRACTURES,

Geological Survey, Denver, CO.
D. L. Campbell.
Geophysics, Vol 42, No 2, p 114-117, February, 1977. 4 Fig, 5 Ref.

Descriptors: *Anisotropy, *Aquifers, *Fractures, Resistivity, Mathematical models, Aquifer characteristics.

A model for estimating the macroanisotropy of fractured beds is presented. This model takes into account both horizontal and vertical fractures. The aquifer is assumed to extend infinitely in the two horizontal directions and current flow is assumed to be perfectly vertical and horizontal. The macroanisotropy coefficient is plotted as a function of horizontal and vertical crack fraction and horizontal crack fraction and vertical vug fraction. A very small fraction of vertical cracks is sufficient to lower the anisotropy coefficient to unity. When there are no horizontal cracks and vertical cracks take up 8 percent of the width of the aquifer, the anisotropy coefficient equals .742. Thus, a vertical electric sounding will assign the aquifer only about three-fourths its true thickness. In the case of a vuggy aquifer, the absence of horizontal cracks can result in a coefficient as low as .226 or an interpreted thickness less than one-fourth its true thickness. (Purdin-NWWA)

THE COFFEE SAND AND RIPLEY AQUIFERS IN MISSISSIPPI,
Geological Survey, Jackson, MS. Water Resources Div.
E. H. Boswell.
Geological Survey Water-Resources Investigations 78-114 (open-file report), 1978. 1 Sheet, 6 Fig, 2 Tab, 19 Ref.

Descriptors: *Mississippi, *Groundwater resources, *Aquifer characteristics, *Water quality, *Water utilization, Maps, Water wells, Water levels, Well data, Water yield, Groundwater availability, Water supply, Selma Group, *Coffee Sand, Ripley formation, Cretaceous aquifers.

The Coffee Sand and Ripley aquifers, of Cretaceous age, are in the Selma Group in northern Mississippi. The aquifers contain freshwater in an area of about 4,400 square miles in northern Mississippi. Water produced from the aquifers by public water systems and numerous industries in 1975 averaged about 4 Mgal/d. Regional water-level declines have been very small and the aquifers have a moderate potential for future development. The aquifers are used in some areas where there are no other significant sources of ground water. The most common problems in developing water supplies are low yields to wells and hard water. (Kosco-USGS)

OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME VI-APPENDIX E, GROUNDWATER.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 274, Price codes: A12 in paper copy, A01 in microfiche. Prepared by the U.S. Geological Survey, Water Resources Division, for the Ohio River Basin Coordinating Committee, 1965. 258 p, 12 Tab, 23 Plates, 19 Ref, 12 Append.

Descriptors: *Water resources development, *Groundwater resources, *Aquifers, *Groundwater availability, *Water sources, *Water supply, *Geologic control, *Ohio River Basin, *Water management, Water quality, Groundwater recharge, Groundwater-surface relationships, Alluvial aquifers, Retention, Hydrology, Geology, Sediment.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin, particularly for that portion within Ohio, Indiana, West Virginia, Kentucky, Tennessee, and Illinois. The main purposes are to provide for further flood control measures and to enhance the economic well being of the Basin. This Appendix investigates the uses and quality of groundwater resources in the Basin. The specific objectives were to make a general appraisal of the groundwater resources; to present information in readily useable format for long-range planning and as a management guide; and to identify hydrologic factors that should be taken into account in formulating and implementing water resource development plans. Data are presented for the Basin as a whole and in detailed reports for 12 sub-regions. Conclusions indicate that, although groundwater resources provide great potential for future development, this will be limited by water quality problems relating to the natural quality of groundwater as well as contamination to both ground and surface waters. The volume of permeable sediments is enormous; the Ohio River provides a large source of water to recharge the underlying valley fill. Development will be limited by technical problems of recharging these sediments, by quality of the Ohio River water, and by economic considerations. Groundwater sources will provide water supplies for future needs over large areas throughout the Basin, although in small areas groundwater conditions are so unfavorable that even small supplies are unobtainable. More studies are needed on the effects on quality caused by interflow of water between surface and sub-surface sources. (Arnold-NC)

CHANGES IN DECOMPOSITION RATE, MICROBIAL POPULATION AND CARBOHYDRATE CONTENT OF AN ACID PEAT BOG AFTER LIMING AND RECLAMATION,
Department of Agriculture, Ottawa (Ontario). Soil Research Inst.
K. C. Ivarson.
Canadian Journal of Soil Science, Vol 57, No 2, p 129-137, May, 1977. 1 Fig, 3 Tab, 42 Ref.

Descriptors: *Peat, *Nutrients, *Decomposition, *Soil microorganisms, Lime, Wetlands, Bogs, Soil, Fungi, Bacteria, Temperature, Hydrogen ion concentration, Ecological effects, Ecology, Canada, Nitrogen, Phosphorus, Potassium.

After eight months of decomposition under laboratory conditions, the unlimed surface sample of an acid peat bog near Alfred, Ontario, contained about five times as many microbes as the unlimed subsurface material. As measured by C02-C released and numbers of bacteria and actinomycetes, lime had greater effects on the microbial activity of the surface material. Nitrifying bacteria were present and needed lime to become active. Twelve genera of fungi were found and fungal numbers decreased with lime. Temperature had little effect whereas pH had a marked effect on fungal genera distribution. Before incubation, the unlimed lower sample was higher in carbon, nitrogen and methoxyl but lower in hexose, pentose and uronic acid than the unlimed upper sample. Hexose and pentose tended to decrease more noticeably in the upper material during decomposition while the other compounds showed no appreciable changes in either layer. Dry matter lost in the surface sample ranged from 8 to 13% and from 2.0 to 3.5% in the lower material. Despite sufficient nitrogen, phosphorus, and potassium and a substantial sugar content, sphagnum litter decomposes at a slower rate than some tree leaf litters. This may be due to the presence of microbial inhibiting substances. (Howard-Mass)

AN ANALYSIS OF INFILTRATION IN INITIAL GRADIENT SOILS,
Punjab Agricultural Univ., Ludhiana (India).
J. P. Soni, and P. Basak.
Mausam, Vol 30, No 1, p 51-54, January 1979. 3 Fig, 1 Tab, 19 Ref.

Descriptors: *Infiltration, *Soil water, *Hydraulic gradient, *Model studies, Mathematical models, Wetting, Soils, Soil water movement, Irrigation, Drainage, Hydraulic conductivity, Moisture content, Hydrology.

Flow through loamy and clay soils starts only when the hydraulic gradients exceed a certain value called initial gradient, thus giving rise to non-Darcian flow. An analytical solution of the problem of infiltration into homogeneous soil with initial gradient was presented, which can be quite useful in the area of irrigation and drainage. The effect of initial gradient on the advance of wetting front, the infiltration rate, and accumulated depth of infiltration was clearly brought out, and it was found that the nonrecognition of initial gradient in soils leads to the overestimation of these values. 2H. Lakes

EFFECTS OF DESTRATIFICATION ON SEDIMENT CHEMISTRY AND BENTHIC MACROINVERTEBRATES IN HAM'S LAKE,
Oklahoma State Univ., Stillwater. School of Biological Sciences.
J. Wilhm, D. Barker, E. Cover, E. Clay, and R. Fehler.
Available from the National Technical Information

Service, Springfield, VA 22161 as PB80-143639, Price codes: A03 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Oklahoma State University, Final Technical Completion Report, December 1979. 40 p, 7 Tab, 39 Ref, OWRT A-079-OKLA (1), 14-34-0001-9038.

Descriptors: *Destratification, *Benthic fauna, *Bloodworms, *Bottom sediments, Oklahoma, Water sampling, Water chemistry, Water temperature, Dissolved oxygen, Stratification, Particle size, Ponds, Mixing, Hypolimnion, Turnovers.

Ham's Lake built in 1965 near Stillwater, Oklahoma, was artifically destratified by mechanical pumping and sampling was conducted to determine changes in physiochemical conditions, sediments and heavy metals, and physiological conditions in Chamoborus punctipennis (phanon midge) and Chironomus riparius (bloodworm). Samples were taken from two stations, one in the central pool that was mixed by pumping oxygen-rich surface water downward, and one that was unmixed due to a submerged dam from a former farm pond. Hypolimnetic water parameters tested include: temperature, dissolved oxygen, conductivity, pH, alkalinity, iron, manganese, copper, zinc, sodium, potassium, and chloride. Sediment parameters tested include particle size, organic carbon, phosphorus, clay mineral composition, pH, iron, manganese, zinc, caloric content, and oxygen uptake. The benthic macroinvertebrates Chaoborus and Chironomus were tested for concentrations of iron, manganese, and zinc; caloric content; hemolymph ion concentration; osmotic pressure; and oxygen uptake. Results show that dissolved oxygen was 3 to 5 mg/l higher in the mixed area and temperature was 6 to 8C higher in the mixed area. Water in the mixed area also had a lower concentration of total manganese. The stratified area showed a greater concentration of organic matter with greater oxygen uptake and hemplymph Na concentration of Chaeborus. Extensive data and results are provided. (Seigler-IPA)

THERMAL PREDICTIONS USING INTEGRAL ENERGY MODEL,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Lab.
D. E. Ford, and H. G. Stefan.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15119, p 39-55, January 1980. 15 Fig, 2 Tab, 19 Ref, 2 Append.

Descriptors: *Lakes, *Water temperature, *Model studies, Mathematical models, Stratification, Profiles, Temperature, Energy, Heating, Winds, Circulation, Mixing, Water quality, Environment, Limnology.

A one-dimensional integral energy model (mixed-layer model) was used to simulate the seasonal temperature cycle of three, morphometrically different, temperate lakes. In the model, turbulent kinetic energy supplied by wind shear was used to entrain denser water into the upper mixed layer by working against gravity. The model was calibrated with data from one lake for 1 yr and verified against data from two other lakes and also against data from other years. Predictions of the onset of stratification, surface and hypolimnetic temperatures, mixed layer depths, and periods of turnover were all in agreement with data. (Sims-ISWS)

SEASONAL CYCLES OF ZOOPLANKTON BIOMASS IN SOUTHEASTERN LAKE MICHIGAN,
Michigan Univ., Ann Arbor. Great Lakes and Marine Waters Center.
B. E. Hawkins, and M. S. Evans.
Journal of Great Lakes Research, Vol 5, No 3-4, p 256-263, 1979. 3 Fig, 3 Tab, 24 Ref.

Descriptors: *Lake Michigan, *Zooplankton, *Copepods, *Biomass, Standing crops, Productivity, Crustaceans, Aquatic animals, Lake stages, Water temperature, Seasonal, Monthly, Fluctuation, Period of growth, Oligotrophy, Mesotrophy.

Spatial and seasonal variations in the crustacean zooplankton biomass in a 250 sq m area of Lake Michigan were studied from 1975 through 1977 as part of an environmental monitoring project for the Donald C. Cook Nuclear Power Plant. A combination of dry weight estimates of individuals of zooplankton species and numerical density (number per cu m) estimates were used to calculate monthly biomass estimates. Animals from an inshore station 9 m in depth and from an offshore station 40 m in depth were weighed and considered to be representative of the range of physical conditions found in the test area. Results show a greater biomass for deeper, offshore stations due to the dominance of large copepod zooplankton that were rare at the inshore stations. The mean annual standing stock was calculated at 60 mg/ cu m which is lower than other Great Lakes and is considered to be characteristic of oligotrophic or mesotrophic lakes. Total zooplankton biomass fluctuated seasonally due to changes (up to 70%) in the mean weight of individual taxa as well as changes in weight per individual. Inverse correlations were found between temperature in the month prior to a collection and the body length and weight of C. bicispidatus thomasi, D. ashlandi, and D. minutus. For several species the seasonal weight cycles were related to the growth of new generations and the temperatures occurring during the development period. (Seigler-IPA)

A PALAEOECOLOGICAL STUDY OF HOLOCENE PEAT BOG SECTIONS IN GERMANY AND THE NETHERLANDS, BASED ON THE ANALYSIS OF POLLEN, SPORES AND MACRO- AND MICROSCOPIC REMAINS OF FUNGI, ALGAE, CORMOPHYTES AND ANIMALS,
Amsterdam Univ. (Netherlands). Hugo de Vries Lab.
B. Van Geel.
Review of Palaeobotany and Palynology, Vol 25, p 1-120, 1978. 27 Fig, 6 Tab, 130 Ref.

Descriptors: *Bogs, *Palynology, *History, Wetlands, Peat, Pollen, Palaeoclimatology, Marsh plants, Succession, *Germany, *Netherlands.

A peat section of the Engbertsdijksveen (The Netherlands) was analyzed for micro-macrofossils in order to obtain maximum information regarding local vegetation and animal succession and regional changes in the prevailing vegetation types. Analysis of the remains and the correlation of the events inside and outside the peat bog site lead to the following conclusions: The Atlantic-Subboreal transition, known for its elm decline, could be correlated with a local change in bog vegetation. Following the alteration of wet Scheuchzeria palustris vegetation with hummock vegetation in the Atlantic period, the appearance of a Molinia coerulea peat coincides with the elm decline. During the climatic deterioration of the Subboreal-Subatlantic transition, the incidence of Corylus avellana decreased. Depressions in the Corylus pollen curve corresponds with particularly wet local vegetation, Corylus pollen maxima correspond with relatively dry bog vegetation. These cyclic fluctuations correspond to approximately 150-200 historical years each. The increasing oceanicity ultimately resulted in the formation of peat by Sphagnum species of the section Cymbifolia. All available data were expressed in curves, in order to indicate changes in local and perhaps regional mosture conditions. (Steiner-Mass)

2I. Water In Plants

MANAGEMENT OF PINUS PINASTER PLANTATIONS ON THE SWAN COASTAL PLAIN FOR TIMBER AND WATER YIELD,
Western Australia Dept. of Forests, Perth.
T. B. Butcher.
Australian Water Resources Council Technical Paper No 42, 1979. 68 p, 26 Fig, 16 Tab, 22 Ref, 3 Append.

Descriptors: *Australia, *Forest management, *Water management(Applied), *Groundwater resources, Groundwater recharge, Seepage, Evapotranspiration, Climatology, Water loss, Soil moisture, Infiltration rates, Recharge, Pine trees, Lumber.

The management of underground water resources and forest resources of State Forest No 65 on the Swan Coastal Plain in Australia was studied to develop a program for economic sawlog production and acceptable water yields to underlying aquifers. This area, north of Perth, contains the largest contiguous area of exotic pine plantations in Western Australia. Under this forested area is a large water resource which can potentially supply 20% of Perth's water needs. By controlling the

number of trees uptake of water by the pines can be balanced with water recharge of the soil. The area has a Mediterranean type climate with cold moist winters and hot dry summers. Because 86% of the annual rainfall occurs in winter when evapotranspiration rates are low, about 75% of the rainfall is available for soil storage and groundwater recharge. The forest currently produces sawlogs at the rate of 900,000 cu m per year. Future sawlog requirements are estimated at 1,400,000 cu m by the year 2010. Water infiltration and evapotranspiration losses can be altered by changing forest density. A heavy pine canopy can intercept 30% of rainfall while thinning can increase effective rainfall by 20%. Plans for the management of the three sectors of the forest are given. The objectives for the southern sector are to provide water, timber, and recreation; for the central sector, water timber, ecotype preservation, and recreation; and for the northern sector, timber and ecotype preservation. Descriptors: *Bogs, *Rooted aquatic plants, *Ecological distribution, *Alpine, *Africa, Wetlands, Marshes, Swamps, Freshwater marshes, Ecology.

High summer rainfall and diurnal climate are characteristic of the rivershed region of the Lesotho mountains in the eastern escarpment of Southern Africa. The daily frost-thaw regime at ground level causes up-freezing, small polygons, terracettes and the formation of thufur in the bogs. The bogs originated in post-glacial times around springs or from small alpine lakes. The bogs are of significance for the regular flow of clear water and for grazing. They are in the process of being eroded through animal trampling and measures for protection are being proposed. Plant communities occurring at high altitudes on thurfur and in depressions in the stream head bogs of Lesotho are analyzed and described. The bog vegetation is compared to surrounding tussock grasses and dwarfshrub vegetation. Chronological analysis of the bog flora showed a pattern of three phytogeographical groups of species: a South African group, a southern and eastern African group, and a northern temperate group. (Howard-Mass)
W80-03507

SEASONALITY, DENSITY AND DIVERSITY OF BIRDS OF A PAPYRUS SWAMP IN WESTERN KENYA,
Shimo-la-Tewa School, Mombasa (Kenya).
P. L. Britton.
Ibis, Vol 120, No 4, p 450-466, October, 1978. 6 Fig, 5 Tab, 65 Ref, 1 Append.

Descriptors: *Birds, *Density, *Rooted aquatic plants, *Swamps, Wetlands, Ecological distribution, Ecology, Africa.

The avifauna of a western Kenya papyrus swamp is specialized with low species diversity indices and few species compared to other west Kenya habitats. Interspecific competition between similar sized species of warblers, a group which dominates the avifauna, is reduced by preference for swamp edge rather than interior habitats, preference for papyrus over standing water, or vertical habitat partitioning. Density figures for common species are higher than in forest undergrowth or thicket. This fact may be interpreted as density compensation on a species-poor 'island' compared to a species-rich 'mainland'. There is a modal egg-laying period from March to June coinciding with the long rains, and a postnuptial primary moult period from June to November which extends into the short rain period. Breeding and moult schedules therefore occupy about eight months and may be readily accommodated in the wetter months of the year. The timing of moult is apparently more synchronized and less haphazard than breeding. Postnuptial moult commenced earlier in a year where the long rains were early. There is little evidence of interrupted moult. Moult schedules are suggested as more flexible in females. (Howard-Mass)

SPARTINA ALTERNIFLORA SEED FUNGI,
North Carolina Univ. at Morehead City. Inst. of Marine Sciences.
R. V. Gessner.
Canadian Journal of Botany, Vol 56, No 23, p 2942-2947, December 1, 1978. 2 Tab, 27 Ref.

Descriptors: *Salt marshes, *Fungi, *Aquatic plants, *Seeds, *Decomposition, Microorganisms, Ecological distribution, Wetlands, Marshes, Estuaries, Ecology, Life history studies, North Carolina.

Filamentous fungi species occurring on Spartina alterniflora seeds submerged in estuarine waters or on salt-marsh sediments in North Carolina included eight Ascomycetes, one Basidiomycete, and 16 Fungi Imperfecti. Marine fungi primarily known as wood-inhabiting species were among the fungi found after two months on the marsh surface or in the adjacent sound and tidal creek. This suggests a role as general decomposers of plant debris in marine habitats for these fungi. After 5 to 7 months, marine fungi and graminicolous Ascomycetes were the only fungi found by direct observation, although seed-borne species commonly found on grain crops could still be isolated by incubation methods. The seeds were completely degraded or barely recognizable after 11 months on the marsh sediments or in sea water. Claviceps purpurea parasitized the seed heads at all the marsh areas sampled. The greatest number of sclerotia were found on the tall S. alterniflora near the lower edge of the marsh in exposed areas and on inflorescences from dredge spoil areas. Up to 183 sclerotia/sq m and sclerotia dry weight values of up to 2.72 g/sq m were found. (Howard-Mass)

MARSH NESTING BY MALLARDS,
Fish and Wildlife Service, Jamestown, NC. Northern Prairie Wildlife Research Center.
G. L. Krapu, L. G. Talent, and T. J. Dwyer.
Wildlife Society Bulletin, Vol 7, No 2, p 104-110, Summer, 1979. 2 Fig, 1 Tab, 27 Ref.

Descriptors: *Mallard duck, *Nesting, *Freshwater marshes, Life history studies, Waterfowl, Nesting cover, Wetlands, Aquatic vegetation, Marshes, Ecology, Wildlife, Habitat, Wildlife management, Potholes.

Sixty-six percent of 53 nest initiated by radiomarked and unmarked mallard hens in a region of the Missouri Coteau in southcentral North Dakota were in wetlands in dense stands of emergent vegetation. Nests were usually within 50 m of the wetland edge. Potential factors contributing to mallard use of marsh habitat for nesting include: better access to tall residual cover at wetland sites than in uplands in early spring; the fact that water is a deterrent to some mammalian predators; and the longer survival length of marsh nests. It remains to be determined whether marsh nesting mallards are a distinct subgroup or if individuals nest interchangeably at marsh and upland sites, and whether imprinting is involved in the habitat selection process. Nesting requirements of mallards at marsh sites should be reconciled with other breeding requirements of this species and needs of other waterfowl before implementing wetland habitat management programs that would favor development of marsh nesting cover at the expense of other important habitat needs. (Howard-Mass)

SEASONAL AND SPATIAL CHANGES IN THE COMPOSITION OF THE AQUATIC AND SEMIAQUATIC VEGETATION OF LAKE CHILWA, MALAWI,
Lake Chilwa Research Project, Limbe (Malawi).
C. Howard-Williams.
Vegetatio, Vol 30, No 1, p 33-39, March 10, 1975. 2 Fig, 2 Tab, 20 Ref.

Descriptors: *Freshwater marshes, *Lakes, *Aquatic plants, *Ecological distribution, Marshes, Wetlands, Spatial distribution, Seasonal, Africa.

Changes in the frequency of individual species and in species composition of the vegetation were monitored at monthly intervals at four stations on the shore of Lake Chilwa. The stations formed a transect from land to lake through the littoral Typha swamp. Stand distance indices decreased from land to lake, while species diversity decreased from land to the central swamp and then rose again on the lake edges. Seasonal changes in the vegetation were more pronounced on the landward edge, which was subjected to alternate wet and dry periods, than in the vegetation of the lake edge. It is suggested that plant communities occurring in a fluctuating physical environment may behave differently with respect to diversity from those in which the environment is temporally stable. (Howard-Mass)

ECOLOGY OF WATER-LEVEL MANIPULATIONS ON A NORTHERN MARSH,
Humboldt State Univ., Arcata, CA.
S. W. Harris, and W. H. Marshall.
Ecology, Vol 44, No 2, p 331-343, Spring, 1963. 3 Fig, 3 Tab, 39 Ref.

Descriptors: *Freshwater marshes, *Drawdown, *Aquatic plants, *Vegetation effects, Marshes, Water level fluctuations, Wetlands, Ecology, Ecological distribution, Minnesota, Plant growth, *Agassiz National Wildlife Refuge(MN).

Vegetation changes associated with marsh drawdowns at Agassiz National Wildlife Refuge, Minnesota, indicate that the development of five types of vegetation on mud flats during the first year was influenced by seed availability, soil type and moisture, season and duration of drawdown, and the amount of stranded algal debris. The more an area combined early season drawdown, rich soil types, slow rates of mud flat drainage, and small amounts of stranded algae, the greater was the development of emergent aquatics. In the second year of drawdown, most areas developed greater amounts of upland and shoreline weeds and fewer emergents. Areas originally exposed before August of the first year lost emergent cover during the second year, while the reverse was true of areas exposed later in the first year. Over a 5-year drawdown, nearly solid stands of willow developed. Upon reflooding, mud flats and shoreline annuals were eliminated and emergents and aquatic annuals developed in the first year. Depending on water depths and cover types, 1- or 2-year drawdowns at 5- to 10-year intervals are required to maintain emergent marshes at this refuge. (Howard-Mass)

THE EFFECT OF THE MARSH ELDER (IVA FRUTESCENS) ON THE STANDING CROP BIOMASS OF SPARTINA PATENS AND ASSOCIATED WILDLIFE,

New Jersey Agricultural Experiment Station, New Brunswick.
J. K. Shisler, T. L. Schulze, and B. L. Howes.
Biological Conservation, Vol 14, No 3, p 159-166, November, 1978. 5 Fig, 3 Tab, 29 Ref.

Descriptors: *Saltmarshes, *Trees, *Dredging, *Environmental effects, *Wildlife habitats, Rooted aquatic plants, Wildlife, Birds, Mammals, Nesting cover, Habitat, Wetlands, New Jersey, Standing crop, Biomass, Organic matter, Ecosystem.

Leaf and wood biomass were highly correlated with age in a population of Iva frutescens L. associated with Spartina patens (Ait.) Muhl on dredged material piles in a New Jersey saltmarsh which was previously managed for mosquito control. Living biomass of S. patens on the marsh surface, on dredged material piles and on dredged material piles with I. frutescens growth were not statistically different. Standing dead biomass of S. patens on the dredged material piles with I. frutescens was significantly lower than dead S. patens biomass on the marsh surface and dredged material, piles without I. frutescens. This was probably a result of increased tidal circulation in the managed marsh. In addition to contributing organic material to the saltmarsh-estuarine ecosystem without causing any detrimental effects on the standing crop biomass of S. patens, I. frutescens was shown to provide nesting and foraging sites for various species of birds, and islands of refuge for small animals and birds. BIOGENIC STRUCTURE AND ITS EFFECT ON THE SPATIAL HETEROGENEITY OF MEIOFAUNA IN A SALT MARSH,
South Carolina Univ., Columbia. Belle W. Baruch Inst. for Marine Biology and Coastal Research.
S. S. Bell, M. C. Watzin, and B. C. Coull.
Journal of Experimental Marine Biology and Ecology, Vol 35, No 2, p 99-107, November, 1978. 2 Fig, 2 Tab, 25 Ref.

Descriptors: *Salt marshes, *Microorganisma, *Spatial distribution, *Rooted aquatic plants, Aquatic animals, Crabs, Burrows, Environmental effects, Wetlands, Marshes, Root systems, Biomass, Ecology, Habitat, South Carolina.

Meiofauna samples collected around and between Spartina plants in the North Inlet estuarine system of South Carolina had either negative correlations with root biomass or no correlation. If, as predicted by earlier workers, meiofauna are attracted to micro-oxygenated zones around roots, there should have been a positive association between meiofauna and roots. Nematodes had higher densities around fiddler crab burrows than in controls, but copepods were less abundant. Biogenic structures significantly affect meiofauna distribution and must be taken into account when quantifying meiofauna in areas with much structural heterogeneity. (Howard-Mass)

SPECIES VERSATILITY IN SHORE HABITATS,
Harvard Univ., Petersham, MA. Harvard Forest.
H. M. Raup.
Journal of the Arnold Arboretum, Vol 56, p 126-163, 1975. 14 Fig, 2 Tab, 41 Ref.

Descriptors: *Shores, *Marsh plants, *Distribution patterns, Lakes, Wetlands, Aquatic plants, Freshwater marshes, Muskeg, Aquatic habitats, Mosses, Spatial distribution, Canada, *Athabaska-Great Slave Lake region(Canada).

This study deals with the shore vegetation of lakes and rivers in the Athabaska-Great Slave Lake region of northwestern Canada. Ten habitat-vegetation complexes are defined to embrace the principal variations that were found: (1) aquatic habitats, with submerged and/or emergent plants; (2) saline or brackish sloughs or wet meadows; (3) muskeg grass-sedge meadows; (4) open shrub muskeg; (5) shrub-tree borders of muskeg; (6) lower beaches on large lakes; (7) upper beaches on large lakes; (8) grass-sedge meadows on river flood plains; (9) shrub-tree borders on meadows; and (10) herbs or trailing shrubs on middle beaches of large lakes. Within the habitats, the vegetation is described in terms of assemblages of vascular plant species which are visibly different from one another owing to the abundance and/or prominence of one or more 'primary' species. VEGETATION AND NUTRIENT STATUS OF NORTHERN MICHIGAN FENS,
Michigan Univ., Pellston. Biological Station.
C. R. Schwintzer.
Canadian Journal of Botany, Vol 56, No 24, p 3044-3055, December 15, 1978. 2 Tab, 26 Ref.

Descriptors: *Fen, *Vegetation, *Nutrients, *Distribution, Bogs, Marshes, Wetlands, Michigan, Water level, Calcium, Mineral water, Hydrogen ion concentration, Ecological distribution, Ecology.

The field layer was the dominant stratum in 5 northern Lower Michigan fens. This stratum contained a total of 85 vascular species with a mean density of 30 vascular species per stand. Carex lasiocarpa was the most prevalent dominant plant and attained a frequency-presence index (FPI) of 8000 of a possible 10,000 and a mean important value of 33 of a possible 200. Other common dominants in decreasing order of FPI were Carex aquatilis (6640), Myrica gale (4636), and Andromeda glaucophylla (2000). Common subordinates were Hypericum virginicum (2639), Muhlenbergia glomerata (2466), and Campanula aparinoides (1400). The homogenity index for the five fens had a value of 58%. The shallow groundwaters were minerotrophic with pH values ranging from 5.7 to 7.0 and calcium concentrations of 11.0 to 75.0 mg/l. Four of the fens were on floating mats and had relatively stable water levels while the fifth was on a grounded mat and was subject to substantial water level fluctuation. Three previously described alkaline lake-edge kettle-hole 'bog' communities were found to be similar to the fens in species composition and water chemistry. (Howard-Mass)

VEGETATION STUDY UNDERTAKEN AT THE LAMTO SAU SAVANNA RESERVE (IVORY COAST)--(VEGETATIONSKUNDLICHE UNTERSUCHUNGEN IM SAVANNENRESERVAT LAMTO (ELFENBEINKUSTE)),
Geottingen Univ. (Germany, F.R.). Lehrstuhl fuer Geobotanik.
W. Schmidt.
Vegetatio, Vol 28, No 3-4, p 145-200, September 28, 1973. 5 Fig, 5 Tab, 26 Ref, 1 Append. (English summary).

Descriptors: *Freshwater marshes, *Vegetation, *Ecological distribution, *Grasslands, Wetlands, Marshes, Ecology, Soil moisture, Africa.

The vegetation of the Lamto Savanna Reserve in the Ivory Coast is classified into four major plant communities on the basis of phytosociological records. The Loudetia phragmitoides-swamp community with its two subdivisions occurs in depressions and is influenced by waterlogging during the rainy season. During the dry season, these sites are burned by bush fires. Life-form spectrums of Savanna vegetation show a marked competition between hemicryptophytes and phanerophytes. Chamaephytes dominate in rock vegetation, therophytes in swamps and phanerophytes in forest stands. (Howard-Mass)

MIRES OF THE MANAPOURI-TE ANAU LOWLANDS,
Canterbury Univ., Christchurch (New Zealand). Dept. of Botany.
C. J. Burrows, and A. T. Dobson.
Proceedings of the New Zealand Ecological Society, Vol 19, p 75-99, 1972. 18 Fig, 15 Tab, 21 Ref, 3 Append.

Descriptors: *History, *Wetlands, *New Zealand, Succession, Marsh plants, Aquatic plants, Marshes, Freshwater marshes.

Lakes Manapouri and Te Anau lie on the eastern margin of the hard rock highland of Fiordland, New Zealand, their basins partially surrounded by steep mountainsides. There are extensive areas of wetlands around the southeastern ends of the lakes. The wetlands have arisen mainly on landforms resulting from the widespread glaciation of the area. The vegetational history of the area is discussed and the origins, general form, margin profile, surface form, stratigraphy, and the vegetational physiognomy of a few individual mires are described. AVIAN ECOLOGY OF A MANAGED GLACIAL MARSH,
M. W. Weller, and L. H. Fredrickson.
In: The Living Bird, Twelfth Annual of the Cornell Laboratory of Ornithology, Cornell University, Ithaca, New York, p 269-291, 1973. 16 Fig, 7 Tab, 13 Ref.

Descriptors: *Freshwater marshes, *Habitat, *Birds, *Marsh management, *Environmental effects, Water levels, Vegetation establishment, Succession, Vegetation effects, Muskrats, Wildlife management, Marshes, Wetlands, Drawdown, Ecology, Ecosystem, Iowa.

Bird populations in a semipermanent glacial marsh in northern Iowa changed dramatically when water levels were lowered to initiate revegetation and then regulated to maintain maximal use by birds and muskrat. The greatest avian number and species diversity were present when 50 to 70 percent of the open water was well interspersed with vegetation. The general pattern of short-term vegetation-bird succession in this type of marsh is: (1) sparse germination of diverse plant species, which may attract many birds when flooded, (2) an increase in density of perennial emergents to form a dense marsh less attractive to birds, (3) an increase in open water resulting from use of the vegetation by muskrat with a resulting increase in numbers and species of birds in the well-interspersed hemi-marsh, until (4) emergent vegetation is eliminated in the central marsh by muskrat and water levels, and bird populations are reduced to those species using the marsh edge. Such successional changes are not permanent but reflect the dynamic changes of an unstable ecosystem. (Howard-Mass)

TUDIES ON THE MICRO-FAUNA OF BLAN-ET BOG WITH PARTICULAR REFERENCE O ENCHYTRAEIDAE. I. FIELD AND LABO-RATORY TESTS OF MICRO-ORGANISMS AS OOD,
Nature Conservancy, Alston (England). Moor House Field Station.
. A. Springett, and P. M. Latter.
ournal of Animal Ecology, Vol 46, p 959-974, 977. 1 Fig, 6 Tab, 26 Ref, 1 Append.

Descriptors: *Food habits, *Aquatic microorgan-sms, *Bogs, Aquatic animals, Wetlands, Worms, Biomass, Secondary productivity, Food chains, Productivity.

As part of a project to study primary and second-ry production in a moorland ecosystem, the im-portance of microorganisms in the food of Enchy-raeidae was investigated in field and laboratory xperiments. The field experiments used two field aiting techniques and included records of other oil fauna. The laboratory experiments tested the rowth of the dominant enchytraeid worm, Cog-ettia sphagnetorum, in microbial cultures. The tudies provided no firm evidence that microor-ganisms form any part of the natural diet of moor-and Enchytraeidae, but the use of soluble nutrients s a possibility. (Steiner-Mass)

NUTRIENT AND PARTICULATE FLUXES IN A SALT MARSH ECOSYSTEM: TIDAL EX-CHANGES AND INPUTS BY PRECIPITATION AND GROUNDWATER,
Marine Biological Lab., Woods Hole, MA. Boston Univ. Marine Program.
. Valiela, J. M. Teal, S. Volkmann, D. Shafer, and E. J. Carpenter.
Limnology and Oceanography, Vol 23, No 4, p 798-812, July, 1978. 9 Fig, 7 Tab, 40 Ref.

Descriptors: *Salt marshes, *Cycling nutrients, *Precipitation, *Groundwater, Nutrients, Phos-phorus, Nitrogen, Carbon, Tidal water, Wetlands, Marshes, Aquatic plants, Ecosystem, Ecology, Or-ganic matter.

Waterborne nutrients enter Great Sippewissett Marsh in Massachusetts through groundwater, rain, and tidal flooding. The ebb of tidal water removes nutrients. During summer, uptake by marsh biota leads to net import of nutrients. The increased export of ammonium in August may be due to leaching from senescent marsh plants. There is a net annual export of ammonium, nitrate, nitrite, dissolved organic (DON) and particulate (PN) ni-trogen, particulate carbon (PC), and phosphate. Ammonium, DON, and PN are the major forms of nitrogen exported. Nutrient concentrations in coastal and marsh water are correlated, and marsh exports could contribute substantially to nutrient supplies of coastal waters. Groundwater entering the marsh provides primarily N03-N and DON. Nutrient inputs through precipitation consist pri-marily of DON, N03-N, and NH4-N. Ground-water carries over 20 times the amount of nutrients brought in by rain; therefore, nitrogen inputs from this source are important to the nitrogen economy of a salt marsh. About half the dissolved inorganic nitrogen brought into the marsh by groundwater is converted to and exported as PN, a form suitable for consumers. PC exported to coastal water is equivalent to 40% of the net annual production of Spartina alterniflora, the dominant marsh plant. (Howard-Mass)

THE CONTRIBUTION OF MACROPHYTES TO THE METALIMNETIC OXYGEN MAXI-MUM IN A MONTANE, OLIGOTROPHIC LAKE,
Virginia Univ., Charlottesville. Dept. of Biology.
C. I. Dubay, and G. M. Simmons, Jr.
American Midland Naturalist, Vol 101, No 1, p 108-117, 1979. 5 Fig, 2 Tab, 29 Ref.

Descriptors: *Lakes, *Rooted aquatic plants, *Dis-solved oxygen, Virginia, Aquatic plants, Oxygen, Ecology, Stratification, Hypolimnion, Distribution patterns, Ecological effects, Standing crop.

Dense beds of rooted macrophytes, primarily Ni-tella flexilis, grow around the circumference of the lake to a depth of 11 m. There was no correlation between the positive heterograde oxygen curve and limnetic phytoplankton density or estimates of primary productivity. The strongest association ex-isted between the metalimnetic oxygen maximum and the standing crop dry weights of the macro-phyte community. All transects across the macro-phyte beds indicated the greatest standing crop to be between depths of 6 to 10 m. Variation in total standing crop between transects is attributed to slope angle of the basin, substrate, and direction of slope, in order of importance. (Steiner-Mass)

VEGETATION ZONATION AROUND FRESH-WATER SPRINGS OF THE MAHARLU SALT LAKE NEAR SHIRAZ (IRAN), VEGETATIONSZONIERUNG AN SUSSWAS-SERQUELLEN DES MAHARLUSALZSEES BEI SHIRAZ (IRAN),
Tuebingen Univ. (Germany, F.R.). Lehrbereich fuer Spexielle Botanik.
W. Frey, and W. Probst.
Vegetatio, Vol 29, No 2, p 109-114, November 25, 1974. 5 Fig, 12 Ref. (English summary).

Descriptors: *Salt marshes, *Aquatic plants, *Eco-logical distribution, *Saline lakes, *Salt tolerance, Ecology, Spatial distribution, Wetlands, Marshes, Iran.

Spatial distribution of vegetation types around three freshwater sources of the salt lake Maharlu in S. Iran is a function of decreasing salinity within the delta-like area between the lake border and the sources. Juncus maritimus dominates on the saline soils of the lake shore. This species is replaced by Aeluropus lagopoides on soils influenced by fresh-water. Freshwater species such as Potamogeton pusillus and Spirogyra fluviatilus establish near the sources. Between the drainage streams of the sources and the shoreline, Cyperus laevigatus dominates. Within this zone three subzones can be distinguished. Species like Spirogyra fluviatilus are found nearest the source with a compact mat of Chara tomentosa occurring farther away. The third subzone, which consists of Cyperus laeviga-tus with Mougeotia cf. crassa and blue algae, pre-cedes the final Salicornia zone, dominated by Sali-cornia europaea and Spergularia marina. ARID LANDS BIOMASS PRODUCTION IN ARIZONA,
Arizona Univ., Tucson. Office of Arid Lands Stud-ies.
K. E. Foster.
Arizona Water Resources Project Information, Project Bulletin No 22, Dec 1979. 3 p, 3 Fig, 3 Tab, 10 Ref.

Descriptors: *Tumbleweed, *Crop production, *Alternative planning, *Efficiencies, *Fuels, Eco-nomic fesibility, Biomass, Consumptive use, Energy conversion, Water conservation, Environ-mental effects, Arizona.

Although more than 3 million hectares (ha) of land in Arizona are available for crop production, only slightly more than 0.5 million ha are farmed each year due to the absence of dependable and inexpen-sive water supplies. An alternative for Arizona's agricultural economy is to cultivate crops that grow naturally in arid and semiarid climates, for example the common Russian thistle or tumbleweed (Salsola kali) which has very high water-use to biomass-produced efficiencies. Al-though cultivation of tumbleweed, a high energy content plant suitable for biomass-derived fuels, involves considerable amounts of land, it appears that water conservation, energy, economic, and environmental gains are greater than the costs, particularly since retired agricultural lands are available for economic use, and agriculture could be restored to those communities where it has been the prime source of revenue but has been declining due to lack of inexpensive water. Rates of sediment bioturbation and advective ex-change of water across the sediment-water inter-face in Narragansett Bay, Rhode Island, were stud-ied by radioactive tracer experiments. The 'biologi-cal pumping rate' of water across the interface (0.7 0.3 cu cm/sq cm/day) was calculated from a two box model in which the decrease in 22Na concen-tration in water overlying a box core was ascribed to animal pumping of water across the sediment-water interface. The 'diffusion coefficient' of solid sediment was determined to be 3 1 x 10 to the minus 7th power sq cm/s from the depth distribu-tion at the end of the experiment of 141Ce tagged microspheres and 59Fe (which was quantitatively scavenged onto particles at the start of the experi-ment). The pore water profile determined for 54Mn in the cores was similar to stable Mn profiles previously determined for the site. Of the radioiso-topes added to the water overlying the box core, nearly 100% of the Na and 50% of Sr remained in solution, while only 10% of the Ba, Mn, and Hg and less than 1% of the Cd, Zn, and Fe remained in solution when the experiments were terminated. Estuarine and Coastal Marine Science, Vol 9, No 5, p 623-629, November 1979. 3 Fig, 4 Tab, 13 Ref.

Descriptors: *Trace elements, *Sediments, *Sus-pended solids, *Estuaries, Sampling, Chemical analysis, Neutron activation analysis, Heavy metals, Chemicals, Tidal waters, Coasts, Rivers, Sedimentation, Sedimentology, *England, *Thames Estuary(England), Resuspended sedi-ments.

Concentrations of Ce, Th, Cr, Hf, Cs, Sc, Fe, Co, and Eu were determined in the suspended particu-

late matter and sediments of the Sea Reach area of the Thames Estuary using instrumental neutron activation analysis. Element-scandium relationships in the materials indicated a difference in composition of the suspended matter to the sediment, and it was suggested that the suspended matter represents resuspended fine grained detrital sediment. The observed hafnium enrichment in the sediment was discussed in relation to this. (Sims-ISWS)

SEASONAL SHIFTS OF SEDIMENT WITHIN AN ESTUARY MEDIATED BY ALGAL GROWTH,
Birkbeck Coll., London (England). Dept. of Geology.
L. E. Frostick, and I. N. McCave.
Estuarine and Coastal Marine Science, Vol 9, No 5, p 569-576, November 1979. 4 Fig, 1 Tab, 16 Ref.

Descriptors: *Mudflats, *Estuaries, *Algae, *Sediments, Coasts, Deposition(Sediments), Erosion, Euglenophyta, Biology, Effects, Sedimentation, Sedimentology, *England, *East Anglia(England).

Measurements of the level of mud flats in the Deben estuary (Suffolk, England) show seasonal change with accretion of about 5 cm between April and September during algal growth, and erosion of that amount during autumn and winter when algae are dead or absent. Although some seasonal change might occur in the absence of algae, the rates of deposition involved require that erosion be inhibited and sedimentation be maximized from the available suspensions. In this, the binding and baffling activity of algae was apparent. The total amount of deposition on the flats (100,000 tons) was far more than can be supplied from the river or the sea, and transfer between the channel banks and the tidal flats on a seasonal basis was postulated. THE DETERMINATION OF ESTUARINE SEDIMENTATION RATES BY 134CS/137CS AND OTHER ARTIFICIAL RADIONUCLIDE PROFILES,
Lancaster Univ., Bailrigg (England). Dept. of Environmental Sciences.
S. R. Aston, and D. A. Stanners.
Estuarine and Coastal Marine Science, Vol 9, No 5, p 529-541, November 1979. 4 Fig, 5 Tab, 41 Ref.

Descriptors: *Sedimentation rates, *Estuaries, *Isotope studies, *Radioisotopes, Profiles, Sediments, Sedimentation, Radioactive dating, Sampling, Cores, Data processing, Sedimentology, *England.

The profiles of 137Cs, 134Cs, 106Ru, 144Ce, 95Zr/Nb, and the 134Cs/137Cs ratio in a sediment core and their discharge patterns from the Windscale Nuclear Plant were used to determine the net sedimentation rate on an estuarine intertidal bank. The use of multiradionuclide and 134Cs/137Cs ratio profiles suggested that previous single radionuclide profiles which have been used for sedimentation rate determinations may be subject to errors. Apparent diffusion coefficients were used in a modification of Lerman's model to correct the input pattern of the radionuclides for postdepositional migration. A comparison of the corrected profiles with the observed profiles suggested that the vertical distribution of radionuclides is not significantly altered after deposition and closely relates to the discharge pattern. The multiradionuclide discharge patterns and sediment profiles indicated that the net sedimentation rate is in the range 50-80 mm/year, while the 134Cs/137Cs ratio data gave a more reliable estimate of 67 mm/year. A PREDICTIVE MODEL OF SEDIMENT TRANSPORT IN LAKE MICHIGAN BASED UPON CLAY MINERALOGY,
Michigan State Univ., East Lansing. Dept. of Natural Science.
G. P. Merk.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-147275, Price codes: A02 in paper copy, A01 in microfiche. Project Completion Report, January 1980. 14 p, 1 Fig, 3 Tab, 4 Ref. OWRT A-093-MICH(1).

Descriptors: *Lake Michigan, *Clay minerals, *Sediment transport, *Water pollution sources, Sediments, Illite, Kaolinite, Particle size, Suspended solids, Deposition(Sediments), Bottom sampling, Laboratory tests, Soil analysis, Assay.

Clay minerals present in the sediments of rivers emptying into southern Lake Michigan and those present in the surficial sediment of southern Lake Michigan (Waukegan Member) were studied to develop a model of sediment transport for that area of the lake. It appears that man-made pollutants from areas around the lake are being concentrated in the clays and sediment of this area. Rivers sampled include the St. Joseph, the Black, the Kalamazoo, the Grand, and the Muskegon. Each river was sampled three times using a depth integrating water sample to collect about 15 gallons per sample. The samples were treated in the laboratory to identify the various clay minerals which included illite, kaolinite, chlorite, and vermiculite. Peak height values were also calculated from x-ray diffractograms of the clay fraction of the samples and were used to develop the geographic pattern of clay mineral variations in the rivers. Samples from six locations in the Waukegan Member were also analyzed in the laboratory and diffractograms were made. Comparisons of clay mineral peak height ratios on the diffractograms do not show any pattern of lateral variation between the six stations sampled. Also the ranking order of clay minerals found for the Waukegan Member are consistent for the stations sampled. This uniformity and the existence of sand at all sites suggests a lakewide current system producing much sediment dispersion, mixing, and resuspension. (Seigler-IPA)

AGGRADATION IN STREAMS DUE TO OVER-LOADING,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Civil Engineering.
J. P. Soni, R. J. Garde, and K. G. Ranga Raju.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15147, p 117-132, January 1980. 12 Fig, 14 Ref, 2 Append.

Descriptors: *Alluvial channels, *Aggradation, *Mathematical models, Hydraulics, River beds, Sediment transport, Rivers, Sedimentation, Sediment load, Equations, Streams, Flumes, Flow, *Stream overloading, Sediment characteristics.

The problem of aggradation due to increase in the rate of sediment supply in excess of what the stream can carry has been investigated. The supply of sediment is assumed to be continuous and at a constant rate. A relationship for the depth of aggradation at any time and at any distance from the section of sediment addition has been developed. Since the mathematical model used was based on many simplifying assumptions, it needed verification against a known set of data. Experiments were, therefore, performed in the laboratory, and these have enabled suitable modification of the analytical results. (Lee-ISWS)

GEOLOGY AND GEOCHEMISTRY OF THE SHIP CREEK AND MONASHKA CREEK RESERVOIRS, SOUTHCENTRAL ALASKA,
Alaska Univ., Fairbanks. Inst. of Water Resources.
D. B. Hawkins, and G. L. Nelson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-143654, Price codes: A05 in paper copy, A01 in microfiche. Report No IWR-71, 1976. 70 p, 12 Fig, 8 Tab, 16 Ref, 8 Append, OWRT A-045-ALAS (1), 14-31-0001-5002.

Descriptors: *Hydrogeology, *Geochemistry, *Water chemistry, *Alaska, Streams, Water quality, Soil chemistry, Solubility, Leaching, Soluble rocks, Graywacke, *Ship Creek(Alaska), *Monashka(Alaska).

Graywacke from the Ship Creek watershed dissolves incongruently in distilled water. The dissolution appears to follow a first-order rate law, which is developed along with experimentally derived rate constants for this dissolution. A surface area correction term must be inserted in this equation if it is applied to a different size fraction. Using equation and rate constants, the chemical composition of a water in contact with graywacke was calculated. With the exception of magnesium, there was good agreement between the calculated composition and that of Ship Creek water. Assuming that the groundwater in the Ship Creek watershed contacts about 1500 cc graywacke per liter, 120 to 360 days are required at 5C to produce the concentration of ions observed in Ship Creek. Release of exchangeable hydrogen ions from the soil to the reservoir water will not significantly lower the pH of the water. Leaching of heavy metals from sulfides contained in the bedrock of the two watersheds does not pose a water quality hazard. Lineaments in the bedrock at Monaska Creek may provide channels through which water may seep from the reservoir. These are not expected to pose a problem in retaining water in the reservoir, but these may result in small, new springs down grade from the reservoir. (Paulson-Alaska)

ON MAN-INDUCED VARIATIONS IN THE CIRCULATION OF THE MEDITERRANEAN SEA,
Miami Univ., FL.; and National Oceanic and Atmospheric Administration, Miami, FL.; and Cooperative Inst. for Marine and Atmospheric Studies, Miami, FL.
D. Nof.
Tellus, Vol 31, No 6, p 558-564, December 1979. 2 Fig, 13 Ref. NSF ATM-28126, ATM75-22940.

Descriptors: *Circulation, *Water circulation, *Salinity, *Diversion, Rivers, Runoff, Mixing, Evaporation, Inflow, Model studies, Mathematical models, Oceanography, *Mediterranean Sea, *Straits of Gibraltar, *Nile River, River diversion.

The response of the Mediterranean Sea to a diversion of rivers, such as the Nile, for agricultural use, was investigated by a simplified dynamical model for the Mediterranean basin. Solutions were obtained by using the principle of 'hydraulic control' at the Straits of Gibraltar, volume and salinity conservations, and perturbation techniques. It was found that such a diversion causes an increase of salinity in the basin and alters the exchange between the Mediterranean Sea and the Atlantic Ocean. The predicted result was an increase in the transport through the Straits of Gibraltar. This

ncrease of both the transport into and from the Mediterranean is about eight times larger than the mount of water which is diverted and is expected o take place within 25-50 years after the diversion. or the Nile alone, which has been diverted in the id-1960s, an increase of approximately 0.5% in ie transport through the Gibraltar Straits will ccur, and if all runoff flowing into the Mediterra-ean Sea was to be diverted, an increase of ap-roximately 3.5% will take place. YPSOMETRY OF THE CONTINENTAL HELF OFF EASTERN NORTH AMERICA,
Voods Hole Oceanographic Institution, MA.
. O. Emery.
stuarine and Coastal Marine Science, Vol 9, No p 653-658, November 1979. 3 Fig, 2 Tab, 8 Ref.

Descriptors: *Hypsometric analysis, *Continental helf, *Atlantic Ocean, *Gulf of Mexico, *North merica, Bathymetry, Oceans, Coasts, Sediments, rosion, Continental slope, Geomorphology, larine geology, *Eastern U.S., Depth zones, Vater masses.

reas measured between contours at 20-m inter-als on most of the continental shelf off eastern lorth America were used to construct histograms nd cumulative curves of areas of bottom and olumes of overlying water at various depths. The rgest and deepest (212-m to 93-m median depths) helf provinces are those that have undergone gla-ial erosion; these have most of the overlying vater. More typical of continental shelves of the vorld are those floored by thick sediments; they ave median depths between 27 and 40 m and most re broadly convex in profile between the shore nd the shelf break. Also convex upward are the elt between the shore and the -100-m contours nd the belt between -20 m and 20 m above sea evel. However, the belt between the 20-m and 00-m contours and the broader one between the -00-m and 100-m contours are concave upward. his geometry is about what would be expected om the known history of marine erosion and eposition on a relatively submergent coast. Descriptors: *Circulation, *Currents(Water), *Estuaries, Water circulation, Current meters, Measurement, Coasts, Tidal waters, Winds, Temperature, Water temperature, Salinity, Density, Transmissivity, Chlorophyll, Sampling, Oceanography, Scotland, *Firth of Clyde(Scotland).

n the period 1972-1974, 530 days of current obser-ations were obtained in the Firth of Clyde, on the vest coast of Scotland. In addition, hydrographic urveys were conducted at frequent intervals from vhich geostrophic currents were calculated. Tidal treams in the area were low (less than 10 cm/s), nd because of the resulting low levels of turbu-ence and mixing, the water structure was patchy vith relatively large horizontal and vertical densi-y gradients. Many of the fluctuations in velocity vere due to advection of the patches which were in geostrophic balance. In addition, there were wind-driven flows which occasionally caused rapid renewal of the water in the Firth of Clyde. The wind/current relationship was complex, however, and appeared dependent on the existing density distribution. (Sims-ISWS)

PHYTOPLANKTON PRODUCTION IN A TURBID, TEMPERATE SALT MARSH ESTUARY,
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
R. E. Turner, S. W. Woo, and H. R. Jitts.
Estuarine and Coastal Marine Science, Vol 9, No 5, p 603-613, November 1979. 5 Fig, 3 Tab, 33 Ref.

Descriptors: *Phytoplankton, *Estuaries, *Salt marshes, *Georgia, Plankton, Primary productivity, Aquatic productivity, Coasts, Tidal waters, Wetlands, Marshes, Sampling, Light, Temperature, Water temperature, Storms, Biology, *Wassaw Sound(GA).

Maximum rates of particulate formation (P sub max) by phytoplankton in the Wassaw Sound estuary (Georgia, U.S.) average 20.2 mg C/cu m/h. Annual primary production is about 90 g C/sq m. The point at which plankton photosynthesis is saturated with light (I sub k) is lowest during winter. Short term temperature fluctuations cause a shift in I sub k paralleling the seasonal relationship of I sub k vs. temperature. Seasonal changes in P sub max are also closely related to temperature in the estuary. Temporal and spatial variation of both P sub max and light attenuation is considerable. The marsh appears to be a net consumer of photosynthetically active phytoplankton cells. Estuarine flushing by storms and rivers spills the accumulated estuarine phytoplankton into the nearshore zone where the much more favorable light conditions lead to a dramatic increase in production per sq m. COASTAL COLLOIDAL CARBON: A STUDY OF ITS SEASONAL VARIATION AND THE POSSIBILITY OF RIVER INPUT,
Duke Univ., Beaufort, NC. Marine Lab.
A. Zsolnay.
Estuarine and Coastal Marine Science, Vol 9, No 5, p 559-567, November 1979. 6 Fig, 3 Tab, 18 Ref. ONR N00014-78-C-0294.

Descriptors: *Carbon, *Colloids, *Sea water, *Atlantic Ocean, *North Carolina, Coasts, Sampling, Monitoring, Organic matter, Rivers, Seasonal, Variability, Analytical techniques, Chromatography, Oceanography, Pyrolysis.

The concentration of organic colloidal and nonparticulate carbon was monitored for one year off the coast of North Carolina. The mean value for colloidal carbon was 148 25.0 micrograms/liter. No seasonal pattern was apparent. Furthermore, the amount of colloidal carbon appeared to be independent of the amount of nonparticulate carbon. On an average, 11 2.0% of the nonparticulate carbon was colloidal. A strong negative correlation between colloidal carbon concentrations and salinity was found, indicating that the bulk of the colloidal material in rivers does not reach the coast. 'Fingerprints' obtained with pyrolysis-gas liquid chromatography show that coastal and river/estuarine colloidal material are composed of different compounds. Coastal colloidal material had no significant fluorescence or light absorption in the ultraviolet and visible range, indicating that it is poor in aromatics and other chromophores. Therefore, it is not composed of gelbstoff. (Sims-ISWS)

COMMUNITY STRUCTURE AND SEASONAL VARIATION IN INTERTIDAL PANAMANIAN SANDY BEACHES,
San Diego State Univ., CA. Center for Marine Studies.
D. M. Dexter.
Estuarine and Coastal Marine Science, Vol 9, No 5, p 543-558, November 1979. 5 Tab, 47 Ref.

Descriptors: *Beaches, *Biological communities, *Benthic fauna, *Pacific Ocean, Sampling, On-site investigations, Intertidal areas, Coasts, Tropical regions, Biomass, Density, Biology, *Panama, *Caribbean Sea.

Two Panamanian sandy beaches, one along each coast, were examined in 1973-1974 as a continuation of preliminary sampling in 1969-1970. Infaunal community structure for each beach was described in terms of species composition, density, biomass, diversity, and evenness. The influence of environmental factors on the zonation and abundance of the dominant species was discussed. The Caribbean beach was exposed to a marked wet vs. dry season, while the major environmental feature of the Pacific beach is a strong upwelling of cool water during the dry season. Community structure of the Caribbean beach was characterized by lower density, fewer species, higher diversity, and greater fluctuation among faunal dominants. The Pacific beach fauna had higher density, greater number of species, and lower diversity due to the dominance by the isopod Excirolana braziliensis. Explanations for the major differences in community structure between the two beaches were presented. (Sims-ISWS)

SALT MARSHES AND SALT DESERTS OF THE WORLD,
Auckland Univ. (New Zealand). Dept. of Botany.
V. J. Chapman.
In: Ecology of Halophytes, Reimold, R. J., and Queen, W. H. (eads.), Academic Press, Inc., New York. p 3-19, 1974. 1 Fig, 112 Ref.

Descriptors: *Salt marshes, *Deserts, *Geographical regions, Wetlands, Marshes, Marsh plants, Distribution patterns, Halophytes, Desert plants, Saline soils.

One characteristic of salt marshes and salt deserts is provided by the fact that only a relatively small number of plant species are capable of tolerating the degrees of salinity that occur. As a result, there are broad geographical areas in which there is a substantial uniformity in the vegetation. In some cases, subdivision can be based on temperatures or upon soil type. The dominant vegetation of maritime salt marshes is essentially phanerogamic herbs, though some shrubs also occur. Inland salt marshes, and especially salt deserts, are typified by shrubs. Apart from the phanerogams, maritime salt

marshes also carry an extensive algal vegetation which may, in places, be as important as the phanerogams. (Steiner-Mass)

PRODUCTION AND STRUCTURE IN THE EARLY STAGES OF VEGETATION DEVELOPMENT IN THE LAUWERSZEE-POLDER,
Groningen Rijksuniversiteit (Netherlands). Afdeling Plantenoecologie.
W. Joenje.
Vegetatio, Vol 29, No 2, p 101-108, November 25, 1974. 6 Fig, 4 Tab, 11 Ref.

Descriptors: *Estuarine environment, *Vegetation establishment, *Halophytes, *Succession, *Productivity, *Embankments, Mud flats, Wetlands, Ecological distribution, Saline soils, Salt tolerance, *Netherlands.

During the first growing season after embankment of the Lauwerszee estuary, there was a rapid increase in biomass and appearance of many species on quickly desalinating areas, and a slow colonization by only a few species and low productivity on areas with impeded desalination. The halophytic pioneer vegetation consisted almost completely of Salicornia spp., Sugeda maritima, Atriplex hastata, and Spartina x townsendii. In the initial stage after embankment, plant densities were determined by the available amount of seeds, while after three years the total number and biomass was limited by environmental factors, especially those affecting soil fertility. The low productivity of the polder communities probably results from low fertility that limits the growth of the halophytes (which are used to a relatively rich supply of nutrients), and the salinity and delays in dispersal that exclude other species. Descriptors: *Estuaries, *Bays, *Inlets(Waterways), *Mathematical models, Simulation analysis, *Numerical simulation, *Tidal inlets, *Coos Bay(Ore).

Coos Bay Inlet, on the south central coast of Oregon, provides tidal flow to two estuary systems: Coos River to the north and South Slough to the south. Charleston Harbor is located at the entrance into South Slough and is affected by continual shoaling problems within the harbor entrance channel. A two-dimensional numerical tidal model (WIFM) was used to investigate the tidal hydrodynamics of the inlet complex. The complex geometry of the Coos Bay area made it necessary to develop a capability of computing the tidal regime on a variable grid system. This study applies WIFM to the Coos Bay-South Slough complex to predict quantitatively the hydrodynamics (exclusive of sediment transport and wave action) of the tidal flow in the system and compare existing conditions and alternate improvement plans. The improvement plans provide for: 1. Construction of specified navigation channels; 2. Alternate breakwater extensions west of the entrance channel; 3. Alternate detached groins east of the entrance channel. Five alternate plans were tested, and the results show that the introduction of any of the improvement plans as proposed would not produce any detrimental impact to tidal circulation in South Slough. MOVEMENT OF SUSPENDED PARTICLES AND SOLUTE CONCENTRATIONS WITH INFLOW AND TIDAL ACTION,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
A. N. Williamson.
Available from the National Technical Information Service, Springfield, VA 22161 as N73-25358, Price codes: A02 in paper copy, A01 in microfiche. Technical Report M-78-2, August 1978. 170 p, 19 Fig, 6 Tab, 16 Ref, 3 Append.

Descriptors: *Suspended load, *Solutes, *Data collections, *Inflow, Tides, Chesapeake Bay, Movement, Suspended solids, Tidal effects, Salinity, *Spectrum analysis.

Landsat (formerly called ERTS-1) data recorded on computer-compatible tapes (CCT's) augmented by data derived from ground control measurements were used to determine the feasibility of detecting alterations to the optical properties of water caused by the movement of suspended particles and solutes in selected portions of the Chesapeake Bay area. Techniques were developed to process CCT's on a PDP-15 computer, establish correlations of radiance and suspended material concentrations, and produce suspended material distribution photomaps. This report discusses these techniques, and includes in appendixes a discussion of experience with automated data collection systems in connection with this study, validation of the computer algorithms for high suspended material concentrations, and by-products that resulted from this study. PROCESS DESIGN OF A 100,000 GALLON PER DAY VACUUM FREEZING EJECTOR ABSORPTION PILOT PLANT,
Chicago Bridge and Iron Co., Plainfield, IL.
V. F. Allo, T. R. Carbery, D. C. Cutler, G. E. Engdahl, and J. A. Nail.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-144017, Price codes: A07 in paper copy, A01 in microfiche. Final Report to Office of Water Research and Technology, December 1979. 111 p, Append, OWRT C-90058-D (9512) (1), 14-34-0001-9512.

Descriptors: *Desalination, *Desalination freezing process, Vacuum freezing, Ejector, Absorption, Design, Concept, Pilot plants, Cost analysis, Water desalting, Crystallization, Freezing.

A conceptual design study of the vacuum freezing ejector absorption (VFEA) process was completed and specifications were prepared for a nominal 100,000 gallon per day pilot plant. Included in the design are a process flow sheet, piping and instrumentation diagrams, equipment specifications, a computer program model, and preliminary engineering drawings. VFEA is a freeze desalination process in which water vapor from a vacuum freezer is compressed by a combination steam ejector and absorber loop. The absorption solution for this design is concentrated sodium hydroxide. Also included is an estimated budget cost to do the final engineering and to build the pilot plant.
W80-03301

DESALINIZATION AND CHEMICAL EXTRACTION PROCESS,
Desal-Chem, Inc., Tulsa, OK. (Assignee).
D. D. Childress.
U.S. Patent No 4,176,023, 6 p, 3 Fig, 1 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1038, November 27, 1979.

Descriptors: *Patents, *Desalination, *Water purification, *Desalination processes, Water treatment, Desalination apparatus, Vapor compression distillation, Separation techniques, Waste, Electrolysis, Gases, Chlorine, By-products.

A combined desalinization and extraction process is described for brinewater having a salinity of 7 1/2% to 9%. The brinewater is introduced to a concentrator basically similar to a shell-and-tube type heat exchanger vertically arranged with upper and lower chambers above and below the tube section and communicating with each other through the tubes. A heating element in the lower chamber causes the brinewater to be heated until it reaches its boiling temperature. Vapors are removed from the upper chamber and are externally compressed so as to create a partial vacuum in the upper chamber. The compressed vapors are passed from the compressor to the concentrator into the spaces on the outside of the tubes where the vapors are condensed as liquid water. The condensed fresh water on the outside of the tubes is removed. The remaining brinewater within the tubes, which is concentrated at 28% salinity, is conducted to electrolytic cells having positively charged anodes and negatively charged cathodes. The concentrated brine is electrolyzed with low voltage direct current to release chlorine gas, caustic alkali containing primarily sodium hydroxide, hydrogen gas, and an inert material containing calcium, nitrogen, and magnesium oxide. The chlorine gas is conducted to a mist extractor separator to remove any impurities and then compressed to form liquid chlorine. The hydrogen gas is conducted to a mist extraction separator to remove any impurities. (Sinha-OEIS)

Water Resources Bulletin, Vol 15, No 6, p 1589-1601, December, 1979. 2 Fig, 6 Tab, 11 Ref.

Descriptors: *Southwest U.S., *Desalination plants, *Economic feasibility, *Nuclear powerplants, Ground water, Brackish water, Freshwater, Heat transfer, Flash distillation, Reservoirs, Irrigation, Recreation, Brine disposal, Byproducts, Water transfer.

The economic feasibility of using a nuclear power facility for simultaneous energy production and desalination of brackish ground water was evaluated for the Southwestern United States. Other benefits to be derived from such a dual purpose facility

are mineral recovery using heat which is usually wasted in power production, water-based recreational opportunities, and irrigation storage. Two alternative project designs were developed. The first alternative considered all the possible project benefits mentioned above while the second alternative included transferring desalted water to two adjacent rivers instead of a reservoir. In the first alternative, the net benefits ranged from $-986.57 million at a 5% discount rate to $-1,137.528 million at a 10% discount rate. In the second alternative, net benefits ranged from $-382.527 million to $-478.612 million at the 5 and 10 percent discount rates. With the possible introduction of hot, dry rock geothermal energy, the cost of desalination may be reduced enough to make dual purpose nuclear desalination of ground water in the southwest economically feasible. PERFORMANCE EVALUATION OF WATER HARVESTING CATCHMENTS,
Science and Education Administration, Tucson, AZ. Southwest Rangeland Watershed Research Center.
G. W. Frasier, K. R. Cooley, and J. R. Griggs.
Journal of Range Management, Vol 32, No 6, p 453-456, Nov 1979. 2 Fig, 3 Tab, 4 Ref.

Descriptors: *Water harvesting, *Rainfall-runoff relationships, *Sprinkling, *Membranes, *Water yield improvement, Evaluation, Surface sealing, Infiltration, Surface runoff, Testing procedures.

A small portable sprinkler was used to estimate runoff efficiencies of various catchment treatments on 14 operational water harvesting systems at the Granite Reef Test Site in Arizona. This method, which is verified using actual rainfall-runoff data from test plots, indicates that the performance of a water harvesting system depends on the effectiveness of the catchment apron treatment to inhibit infiltration. Membrane treatments, like asphalt, fiberglass, and butyl, yielded 90-100% precipitation runoff while properly installed wax-type treatments yielded over 80% runoff. A gravel-covered polyethylene treatment was found to require a high threshhold rainfall quantity to overcome water retention within the gravel layer. It is hoped that this sprinkler method will permit evaluation of catchment runoff efficiencies without resorting to the time and effort required for large field-instrumentation projects. WASTEWATER HELPS THE BARLEY GROW,
Arizona Univ., Tucson. Dept. of Plant Sciences.
D. A. Day, J. A. McFadyen, T. C. Tucker, and C. B. Cluff.
Water and Wastes Engineering, Vol 16, No 8, p 26-28, August 1979. 4 Tab.

Descriptors: *Barley, *Water reuse, *Irrigation effects, *Crop response, Waste water disposal, Municipal wastes, Environmental effects, Plant growth, Soil properties, Hydrogen Ion concentration, Mixing.

The effects of treated municipal wastewater on crops, soils, and irrigation water were investigated in this study near Buckeye, Arizona, 1974-75, to compare (1) response of barley irrigated with a mixture of pump water and wastewater with the response to pump water alone, (2) the effect of pump water and pump water-wastewater irrigation on soil properties, and (3) quality of a pump water-wastewater mixture with that of pump water alone as a source of irrigation water for barley production. Effects of the two treatments were studied on 'Arivat' barley fields set in a modified randomized complete block experimental design with four replications in a predominantly coarse loam soil. Results indicate that barley grown with the mixture was superior in growth, grain yield and quality to that irrigated with pump water alone, while the soil under both types of irrigation had similar pH at the end of the study. Conclusions indicated that treated municipal wastewater can be used as a partial source of irrigation water and plant nutrients in the commercial production of barley in the irrigated areas of the arid southwest U.S. as well as in other similar climatic regions throughout the world. 3E. Conservation In Industry

PROCESS FOR THE SEPARATION OF FOAM FROM EFFLUENTS OF COKE OVEN PLANTS,
United States Steel Corp., Pittsburgh, PA. (Assignee).
L. K. Husher, H. Weber, and K. Tippmer.
US Patent No 4,176,062, 6 p, 2 Fig, 1 Tab, 9 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1050-1051, November 27, 1979.

Descriptors: *Patents, *Separation techniques, *Foam separation, Industrial wastes, Recycling, Water reuse, Coals, Coke oven plants, Tars.

A process is provided for the separation of suspensions and foam from the tar, ammonia liquor and condensate mixture obtained when coking finely ground pre-dried or preheated coal without considerable additional expenditures and consumption of energy and chemicals. A tap phase and a liquid phase are obtained so that the liquid phase can be recycled to the collection main and can be used, problem-free for the cooling of the hot gases produced when coking the coal and surplus liquor can be further processed. The mixture consisting of tar, ammonia liquor and condensate is freed from coarse particles in a primary decanter with concomitant development of a surface suspension and foam of 'swimming tar'. The suspension and foam floating on the surface of the ammonia liquor in the primary decanter is removed by traveling mechanical skimmers, delivered to a foam separator, and permitted to reside in the foam separator for at least two hours to effect separation of a water phase. The water phase is removed from the foam separator and recycled to the primary decanter. (Sinha-OEIS)

INDUSTRIAL WATER ALLOCATION AND CONSERVATION IN CALIFORNIA.
California State Dept. of Water Resources, Sacramento. Office of Emergency Services.
A Compendium of Information for Industrial Water Managers Compiled from Proceedings of the Drought Conference on Industrial Water Allocation and Conservation, January 1978. 148 p.

Descriptors: *California, *Industrial water, *Water allocation(Policy), *Water demand, *Water conservation, Droughts, Industry, Water resources, Water supply, Water consumption, Water policy, Water utilization, Conservation, Water, Water distribution, Planning.

This is a compilation of proceedings of the Drought Conference on Industrial Water Allocation and Conservation held in Concord and Los Angeles (CA) during July 1977. Industrial water use is California's third and smallest sector of water use but the problem of water conservation was recognized even prior to the drought which California was experiencing at the time of this conference. Industry has the best record in conservation as compared to other water use sectors. In California 56% of the industrial water use comes from purveyors (water agencies) and about 44% is self-produced; this includes well water and water taken from rivers. Some short-range plans for industrial conservation include: (1) electrostatic water treatment for cooling towers; (2) re-use of overflow water; (3) recycled water from conductivity transducers; (4) used spray booth recycled water for bearing water makeup at sludge farm pumps; (5) outside water test controls; (6) time rinse sections of washers; and (7) automatic blow down controls for boilers. The potential savings for each of these plans range from 3,500 gallons per day to 46,000 gallons per day. Long-range water conservation plans include the recycling of car wash water and recycling water for wet sand facilities. The report includes discussions of the statewide response to the 1976-1977 drought, future water supplies and the third year of the drought, industrial water supplies for northern and southern California, local agency responses to the drought, specific industrial conservation programs and techniques, and methods of financing water conservation. DEVICE FOR AUTOMATIC, SELECTIVE WATERING OF PLANTS,
L. Richard.
U.S. Patent No 4,175,579, 7 p, 4 Fig, 13 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 890, November 27, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation systems, Water distribution(Applied), Irrigation practices, Irrigation efficiency.

A device for automatically selectively watering plants in a predetermined order for predetermined times comprises a casing which is connected to a source of water under pressure. The device houses a turbine wheel arranged to be driven by the water and to drive a set of gears which form a speed reducer, the output shaft of which extends out of the casing and carries a number of cams spaced apart along the shaft and each arranged to operate a valve of the pilot-operated type. The valves are identical, juxtaposed in a straight line, and connected to pipes provided with watering nozzles. (Sinha-OEIS)
W80-03506

TRICKLE IRRIGATION TIMING AND ITS EFFECT ON PLANT AND SOIL WATER STATUS,
Ben Gurion Univ. of the Negev, Beersheba (Israel). Inst. of Desert Research.
J. Ben-Asher.
Agricultural Water Management, Vol 2, No 3, p 225-232, Nov 1979. 3 Fig, 4 Tab, 3 Ref.

Descriptors: *Timing, *Irrigation efficiency, *Water balance, *Percolation, *Trickle irrigation, Irrigation practices, Crop response, Dune sands, Soil-water-plant relationships.

The effect of trickle irrigation timing was tested with tomato plants on Sinai sand dunes to estimate the various components of water balance under different high-frequency irrigation regimes, and to propose recommendations for irrigation policy. Irrigations were applied during daytime hours for one field and a short time after sunset on a second field in the uniform coarse sandy soil on a coastal area of Nahal Sinai. Results indicate that daytime irrigation of soil with low water-holding capacity significantly increased yields, improved plant water potential, and improved water use efficiency. The author concludes that controlling deep percolation, the dominant component of the water balance under these conditions, requires the measurement of net radiation flux as input for managing the quantity of water to be applied. (Tickes-Arizona)
W80-03545

IRRIGATION MACHINE,
J. M. Arlemark.
U.S. Patent No 4,174,809, 14 p, 10 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 988, No 3, p 625, November 20, 1979.

Descriptors: *Patents, *Irrigation, *Application equipment, Sprinkler irrigation, Irrigation practices, Irrigation efficiency, Irrigation operation and maintenance.

The invention relates to an irrigation machine with a hose reel, rotatably mounted on a wheeled frame for a withdrawable and rewindable hose. One end, fixed to the hose reel, is connectable via a coupling to a water supply source and the other end is connected to a sprinkler gun on a gun carriage or sled. The reel for the hose, which is compression resistant and consists of rigid hose material, is coupled to a driving motor designed as a water turbine. The motor is coupled into a conduit system from the water supply source to the sprinkler gun and the hose reel is mounted with its axis of rotation substantially horizontal. The water turbine is coupled into the conduit system via an adjustable flow divider in the form of a three-way valve with one inlet and two outlets, the water turbine being connected in between the two outlets. (Sinha-OEIS)
W80-03584

IRRIGATION SYSTEM,
Hitachi Chemical Co. Ltd., Tokyo (Japan). (Assignee).
S. Watanabe, and M. Metsugi.
U.S. Patent No 4,174,067, 4 p, 2 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 988, No 2, p 365, November 13, 1979.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Application equipment, Irrigation practices, Irrigation efficiency, Irrigation operation and maintenance, Drip irrigation, Compressed air.

An irrigation system comprises a source of pressurized water and passages for conducting the water from the source to individual irrigation spots. The passages include a plastic pipe having very small slip openings for continuously discharging water. A source of compressed air is connected to the passages and an operational control temporarily stops the supply of pressurized water while the compressed air is discharged through the small slip openings to clear them from clogging. SUMMARY REPORT, SOUTHEAST CONFERENCE ON URBAN STORMWATER MANAGEMENT,
North Carolina Water Resources Inst., Raleigh.
D. H. Howells.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-147564, Price codes: A05 in paper copy, A01 in microfiche. SE Water Resources, Vol 2, No 1, Fall 1979. Conference held April 10-11, 1979 at NC State U, Raleigh. 80 p, 35 Fig. Water Resources Research Institute, University of North Carolina. OWRT B-123-NC(5), 14-34-0001-9144.

Descriptors: *Storm water, *Storm runoff, *Urban runoff, Drainage programs, Water policy, Storage, Flood plain zoning, Flood plains, Erosion control, Sediment control, Water pollution control, Conferences, Southeast U.S., Government, Local governments, State governments.

State, local, and regional programs for urban stormwater management (SWM) in the southeastern U.S. are discussed. Drainage and detention, flood plain management, erosion and sedimentation control, and stormwater pollution control tend to be dealt with in each geographical area on an individual basis. Community implementation of a unified SWM program covering the four areas integrated with zoning and subdivision ordinances is suggested. Prototype water quality studies, urban drainage programs and ordinances, national policy, and conclusions and recommendations of the conference participants are presented. It is recommended that ordinances in general should be concerned with policy and budgetary matters, not engineering criteria, design standards, or administrative detail. More involvement of interest groups, public works agencies, and the public, greater information/technology diffusion, more commitment of state governments, and more local monitoring of programs are suggested. THE IMMEDIATE EFFECTS OF DITCHING A SALTMARSH ON NESTING HERRING GULLS LARUS ARGENTATUS,
Livingston Coll., New Brunswick, NJ. Dept. of Biology.
J. Burger, and J. K. Shisler.
Biological Conservation, Vol 15, No 2, p 85-103, February, 1979. 8 Fig, 1 Tab, 53 Ref.

Descriptors: *Saltmarshes, *Gulls, *Nesting, *Ditches, *Drainage effects, Animal behavior, Birds, Life history studies, Habitat, Nesting cover, Marshes, Wetlands, Environmental effects, Breeding.

The number of pairs of herring gulls breeding on an island in Barnegat Bay, New Jersey, remained the same as in the previous year after ditching in March, before the start of the breeding season. The number of breeding pairs on two nearby islands which were not ditched increased by 46% and 90%. Breeding chronology was similar on all three areas, but birds nesting on spoil laid eggs a mean of 8 days later than non-spoil nesting birds. Behavioural observations on aggression and display rates indicated that birds on spoil behaved similarly to those in open grassy areas but differed from those nesting in the buses. Nest site selection, breeding densities, and breeding success were similar on all three islands. The differences noted were attributed to the appearance of the marsh. It was postulated that pairs having nested on the experimental island in the previous year continued to nest after the island was ditched and pairs searching for new territory colonized the nearby islands. The later nesting of pairs breeding on spoil is attributed to the need to defend their nest sites which were situated in areas used for display by unmated birds. (Howard-Mass)

HABITAT DEVELOPMENT FIELD INVESTIGATIONS, SALT POND NO. 3 MARSH DEVELOPMENT SITE, SOUTH SAN FRANCISCO BAY, CALIFORNIA; SUMMARY REPORT,
San Francisco Bay Marine Research Center, Inc., Richmond, CA.
J. H. Morris, C. L. Newcombe, R. T. Huffman, and J. S. Wilson.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A065 775, Price codes: A03 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Miss. Technical Report D-78-57, December 1978. 22 p, 3 Tab.

Descriptors: *Salt marshes, *Habitats, *Marsh plants, Planting management, Plant growth, Dredged material, Habitat development, Marsh development, *San Francisco Bay(Calif.), Spartina foliosa.

A study of marsh development on confined dredged material substrate in an abandoned salt pond in South San Francisco Bay demonstrated that a California cordgrass (Spartina foliosa) marsh can be established within 2 years. For successful marsh development, proper elevations and tidal flow must be provided. For the San Francisco Bay area, sprigs should be planted in early spring on low wave energy sites and at 0.5- to 1.0-m intervals within the lower two-thirds of the intertidal range. (WES)

MAXIMUM UTILIZATION OF WATER RESOURCES IN A PLANNED COMMUNITY -- APPLICATION OF THE STORM WATER MANAGEMENT MODEL, VOLUME I,
Espey, Huston and Associates, Inc., Austin, TX.
E. V. Diniz, and W. H. Espey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-121437, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-050c, July 1979. 181 p, 68 Fig, 42 Tab, 23 Ref, 5 Append. 802433.

Descriptors: *Mathematical models, *Runoff forecasting, *Urban runoff, *Texas, *Drainage systems, Watersheds(Basins), Hydrographs, Base flow, Infiltration, Rainfall-runoff relationships, Surface runoff, Paving, Water quality, Land use, Water pollution, Erosion.

The Storm Water Management Model (SWMM) was extensively modified and used to model runoff and water quality from natural drainage areas in the Woodlands, an ecologically planned community in Texas, and in the Hunting Bayou, an urbanized watershed near Houston, Texas. New subroutines were programmed to allow SWMM to model (1) separate sewer systems, (2) urbanization effects on baseflows, (3) performance and cost efficiency of natural drainage systems, (4) additional water quality parameters (chemical oxygen demand,

Kjeldahl nitrogen, nitrates, and phosphates), and (5) hydrologic effects of porous pavements. These additional user options provide more model versatility such as the modelling of storm periods separated by low or zero rainfall and the computation of baseflow recessions. Using the model hydrographs were developed for 14 storms at the study sites. Overall results show that SWMM can be a successful tool for the prediction of future urbanization effects, however, the model should be tested in other geographical areas and further developed or refined as additional data is collected. Model limitations are cited for areas with transient land use and areas where extremely high suspended solids concentrations are generated. New subroutine source code listings and revised input coding instructions are included. (Seigler-IPA)

THE MANAGEMENT OF GROUND WATER SUPPLIES,
Ground Water Consultants Group, Edmonton (Alberta).
P. L. Hall.
Water & Sewage Works, Vol 125, No 10, p 54-55, October, 1978. 1 Fig.

Descriptors: *Water management(Applied), *Ground water resources, *Water supply, Aquifers, Water demand, Optimization, Planning, Computer models, Water wells, Well spacing, Efficiencies, Conjunctive use, Artificial recharge, Environmental effects, Pumping, Storage.

The objectives of ground water management are: (1) to meet water demands; (2) to optimize water resources and existing distribution systems; and (3) to develop long-range plans. The physical limitations of the aquifer must be accurately determined before a management plan can be formulated. Peak demands can be met by storage facilities or increased withdrawals. Many water-well fields and their associated storage-distribution systems are not working at maximum efficiency due to interference between closely-spaced wells, scaling of well screens, and corrosion. Evaluation of well-field performance is complex and requires analog or digital computer models. The main advantage of using models is that alternative well locations and pumping rates and schedules can be compared in a short time without the need for expensive, prolonged field tests. The results of modeling are only as good as the quality of the input data. The data should be set up under the supervision of an experienced hydrologist. Long range planning should consider the finite capacity of the aquifer, future demands, adverse environmental impacts, conjunctive use, and artificial recharge. (Purdin-NWWA)

DEALING WITH SITE DISTURBANCES FROM HARVESTING AND SITE PREPARATION IN THE LOWER COASTAL PLAIN,
Southern Forest Experiment Station, Pineville, IA. Forest Insect Research.
E. Shoulders, and T. A. Terry.
In: Proceedings, Symposium on Principles of Maintaining Productivity on Prepared Sites, Mississippi State University, March 21-22, 1978, Sponsored by US Forest Service and Southern Region of the Association of State College and University Forest Res. Organizations, p 85-97, 1978. 44 Ref.

Descriptors: *Lumbering, *Forest management, *Coastal plains, Wetlands, Forests, Roads, Forestry, Soil water, Soil compaction, Soil management, Microenvironment.

Harvesting operations that are carried out when the soil is wet can seriously damage lower coastal plain sites by compacting, puddling, churning, and rutting the soil and by disrupting natural drainage so that excess water is trapped on the surface. Site productivity is substantially reduced unless measures are taken to repair the damage. Damage can be avoided by scheduling operations when the soil is strong enough to support the logging equipment. Preharvest site drainage lengthens the period when damage-free logging can be done. Confirming traffic to as few trails as possible limits the extent of the damage from wet weather logging. (Steiner-Mass)

DRAINAGE AND LARVICIDING FOR CONTROL OF A MALARIA FOCUS IN HAITI,
World Health Organization, Washington, DC. Malaria Eradication Dept.
D. J. Schliessmann, V. R. Joseph, M. Solis, and G. T. Carmichael.
Mosquito News, Vol 33, No 3, p 371-378, September, 1973. 3 Fig, 3 Tab.

Descriptors: *Salt marshes, *Mosquitoes, *Larvicides, *Public health, Construction, Drainage effects, Environmental effects, Wetlands, Habitat, Human diseases, Carriers, *Haiti.

Three outbreak of P. falciparum malaria with more than 1,500 cases were experienced by the Haiti malaria eradication program in a densely populated focus of 10,000 people in 27 months. The focus contributed more than 15 percent of the total cases reported in the country in contrast to less than 0.13 percent in similar time periods before and after the outbreaks. The outbreaks resulted from environmental and ecological changes brought about by the construction of a road and resettlement housing which obstructed the natural drainage of the salt marsh area and created extensive mosquito breeding habitats. It is likely that natural reductions in vector populations during the dry season contributed to limiting the duration of the three epidemics and probably accounts for the control of the first outbreak. Larviciding contributed to the control of the second epidemic. The third epidemic followed the suspension of larviciding which permitted a buildup of vector densities. Its control, and the prevention of malaria during 27 months following the outbreaks while malaria transmission in the country was increasing, is attributed to the combined effects of the drainage project and of the program of larviciding. (Howard-Mass)

IMPACTS OF COAL-FIRED POWER PLANTS ON FISH, WILDLIFE AND THEIR HABITATS,
Argonne National Lab., IL. Environmental Impact Studies.
A. J. Dvorak, B. G. Lewis, P. C. Chee, E. H. Dettmann, and R. F. Freeman, III.
U.S. Fish and Wildlife Service, Office of Biological Sciences Report FWS/OBS-78/29. March, 1978. 260 p, 29 Fig, 62 Tab, 371 Ref, 7 Append.

Descriptors: *Powerplants, *Coal, *Water pollution effects, Power operation and maintenance, Environmental effects, Wildlife habitat, Aquatic habitat, Acid mine water, Chemical wastes, Air pollution, Water pollution, Pollution abatement, Pollutants.

This report contains an assessment of expected impacts to terrestrial and aquatic biota and their habitats which are associated with the operation of coal-fired power stations, from the point at which coal is delivered to the site through disposal of process wastes. Emphasis is placed on discussion of impacts unique to coal combustion, although some features of gas- and oil-fired stations are also addressed. Impacts arising from thermal effluents, condenser cooling facilities, and power transmission are not discussed. Mitigative measures to reduce the magnitude of some of these adverse impacts are described, and include pollution abatement devices, erosion control proper siting and lining of ash and sludge disposal ponds, and reclamation of inactive waste-disposal sites. Included in the report is a list of research topics suggested to improve impact assessment capabilities. (Steiner-Mass)

EFFECTS OF OFF-ROAD VEHICLES ON THE SEDIMENTS OF HATCHES HARBOR, CAPE COD NATIONAL SEASHORE,
Massachusetts Univ., Amherst. Dept. of Geology.
J. A. Hamilton.
Massachusetts University, National Park Service Cooperative Research Unit Report No 30, 1978. 23 p, 21 Fig, 1 Tab, 27 Ref.

Descriptors: *Off-road vehicles, *Sediments, *Intertidal areas, *Geomorphology, Wetlands, Tidal marshes, Sediment transport, Sedimentation, Massachusetts, Sands, Marshes.

Vehicles (ORVs) can greatly increase the amount of overwash by destroying the developing dune

vegetation on the protective sand spit. These overwash deposits are reworked by the daily tidal flooding in the inlet throat. Areas of exposed sand are subject to sediment transport by tidal action. ORV traffic can increase the amount of open sandy areas and rate of movement, and hence quicken the infilling of Hatches Harbor, by creating new sand channels through marsh areas. Because salt marsh vegetation enhances sedimentation by slowing down water flow, ORV disruption of these grasses would tend to thwart siltation. The net impact of ORV disturbance of salt marsh vegetation through the creation of open sandy areas would still be to increase the infilling of Hatches Harbor because of the large flood dominance of sediment transport. Other effects of ORV traffic on the exposed sand area vary with sand composition and vehicle usage. Vehicle passage disturbs the sediment packing to a depth of a few centimeters, which makes the material in disturbed areas more susceptible to transport by tidal currents than undisturbed surfaces. (Steiner-Mass)

EFFECTS OF OFF-ROAD VEHICLES ON PLANTS OF A NORTHERN MARSH,
Massachusetts Univ., Amherst.
J. M. B. Brodhead, and P. J. Godfrey.
Report No 33, 1979. 65 p, 35 Fig, 2 Tab, 16 Ref.

Descriptors: *Marsh plants, *Off-road vehicles, *Vegetation regrowth, Wetlands, Marshes, Salt marshes, Marsh management, Peat, Massachusetts.

The impact of off-road vehicles (ORVs) on the marsh and tidal sand flat environment was determined through controlled impacts of undisturbed sites and the enclosure of ORVs on disturbed sites. Results show that ORV traffic in the low marsh completely destroys both vegetation and peat substrate and produces conditions that delay the rates of natural recovery as well as creates conditions that favor mosquito production. Traffic around the periphery of the marsh creates an ever-growing barren zone with erosion of adjacent dunes and continual degradation of both marsh and dune systems alike. Only a few passes of an ORV are sufficient to severely damage salt marsh species. Recovery, however, begins soon after protection from impacts. Plants found along the dune/marsh border, Ammophila and Spartina patens (erect), can recover in about two years. Full colonization of a barren flat can occur in two years. Spartina alterniflora begins invading disturbed peat substrate slowly but will develop nearly complete cover in four years. Spartina patens (decumbent) is the slowest marsh plant to recover following complete destruction. (Steiner-Mass)

COMBINED VEGETATIVE-STRUCTURAL SLOPE STABILIZATION,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
D. H. Gray, A. T. Leiser, and C. A. White.
Civil Engineering-ASCE, Vol 50, No 1, p 82-85, January 1980. 3 Fig, 2 Tab, 7 Ref, 4 Photo.

Descriptors: *Slope stabilization, *Vegetation establishment, *Erosion control, *California, Bank stabilization, Methodology, Vegetation, Costs, Bank protection, Slope protection, Soils, Embankments, Wattling.

Vegetation in partnership with structural measures provides an attractive and cost effective method of stabilizing slopes and combating erosion. An effective approach is to use contour wattling, willow cuttings, or conventional slope plantings in combination with a low breast wall, gabion revetment, or bench structure constructed at the toe of a slope. Another approach is to grow vegetation in the voids of interstices of structural walls or revetments. The role of vegetation in stabilizing slopes was described; criteria and guidelines for successful wattling or revegetation of slopes were also discussed. Examples and cost comparisons were presented of recent vegetative-structural slope treatments used in the Lake Tahoe Region of California. (Humphreys-ISWS)

EFFECT OF SEDIMENT CONTROL DAMS ON THE WATER QUALITY OF A PRAIRIE LAKE,
South Dakota State Univ. Dept. of Biology.
L. Haertel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-147515, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Institute, South Dakota State University, Completion Report, February 1980. 53 p, 2 Fig, 23 Tab, 28 Ref, 2 Append. OWRT A-061-SDAK (1), 14-34-0001-7088.

Descriptors: *Sediment control, Effects, *Water quality, *Lakes, South Dakota, Dams, Pre-impoundment, Post-impoundment, Water analysis, *Sediment control dams, Algal blooms, Water transparency, Prairie lakes, Nutrient levels.

Water transparency (secchi disc), algal bloom density (chlorophyll a and cell counts) and nutrient chemistry (NH3-N, NO3-N, Organic N, Orthophosphate-P and Total P) were sampled on Lake Cochrane, SD from 1976-1979 during and after sediment dam construction. These data were compared with previous data taken from other studies on Lake Cochrane 1970-1975 using the same sampling techniques. Data were separated by season and compared between years by analysis of variance. 1977 and 1978 (1 and 2 years after sediment dam construction) were consistently higher in nutrient levels for all seasons than other years. 1977 (1 year after construction) was poorest in water transparency for all seasons. Erosion off the steep slopes from the construction is probably responsible for the high nutrient levels and low water transparency observed during those years. Unusually low rainfall in 1976 probably prevented erosion from being a problem during the year of construction. Chlorophyll a analysis of variance indicates that 1978 and 1979 were not significantly different from 1970, the year of lowest algal concentrations and best water transparency measured possibly indicating a trend toward improved water quality after sediment dam construction. However, water transparency readings from 1971 to 1979, were significantly poorer than in 1970. Algal species composition also indicated more eutrophic conditions from 1971-1979 than existed in 1970. LABORATORY EVALUATION OF METHODS TO SEPARATE FINE GRAINED SEDIMENT FROM STORMWATER,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
L. M. Bergstedt, J. M. Wetzel, and J. A. Cardle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-121528, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-076, July 1979. 40 p, 12 Fig, 2 Tab, 4 Ref. R 803579.

Descriptors: *Separation techniques, *Erosion control, *Sediment control, *Storm runoff, Settling basins, Laboratory tests, Construction, Particle size, Sediments, Flocculation, Water pollution sources, Suspended load, Trap efficiency, Water purification.

Two commercially available solid separation devices, an inclined tube settler and a Discostrainer, were tested to study their ability to remove inorganic solids that are less than 100 microns in size from stormwater. These two devices were selected for testing following a literature survey of the various methods for separation of sediment from stormwater at construction sites. Full-scale units were laboratory tested with influent concentrations of approximately 2000 mg/l. The inclined settler tube, manufactured by Neptune Microfloc, Inc., showed some capability for removing fine, inorganic solids from water. Installation of a settler tube to a sedimentation basin was found to reduce the sensitivity of solid removal to overflow rate. The settler tube increases basin efficiency thereby reducing the size of the required sedimentation basin. It was also found that the addition of alum to influent caused increased flocculation and increased solids removal by approximately 6%. The performance of the Discostrainer was marginal with 30% removal of solids at an influent concentration of 1300 mg/l and a 10% removal rate at 2100 mg/l. Tests results for the devices indicate great difficulty in separating the desired size solids from water using physical processes. The cost of using such devices at construction sites may not be economically justifiable. (Seigler-IPA)

LABORATORY OBSERVATIONS ON THE INFLUENCE OF TEMPERATURE AND SALINITY ON DEVELOPMENT OF THE EGGS AND GROWTH OF THE LARVAE OF SOLEA SOLEA (PISCES),
Nederlands Inst. voor Onderzoek der Zee, Texel.
M. Fonds.
Marine Ecology-Progress Series, Vol 1, p 91-99, 1979. 3 Fig, 6 Tab, 39 Ref.

Descriptors: *Water temperature, *Salinity, *Growth rates, *Marine fish, Fish eggs, Larval growth stage, Mortality, Salt tolerance, Thermal stress, Fish physiology, Fish behavior, Spawning, *Sole, *Solea.

Eggs of the sole Solea solea (L.) were incubated at different constant temperatures (10, 13, 16, 19, 22C) and salinities, 10, 20, 30, 40, 50 o/oo); the larvae were reared at the same temperatures but at one salinity (30 o/oo S). High survival and normal development to hatching were observed at temperatures from 10 to 16C and salinities from 20 o/oo to 40 o/oo S. The growth rate increased with increasing size of the larvae and also increased with the rearing temperature to a maximum at 22C. Some environmental factors which may influence the survival of sole eggs and larvae in the sea are discussed. (Deal-EIS)

RESPONSES OF THE FISH BLENNIUS PHOLIS TO FLUCTUATING SALINITIES,
Natural Environment Research Council, Bangor (Wales). Marine Invertebrate Biology Unit.
J. Davenport, and O. Vahl.
Marine Ecology-Progress Series, Vol 1, p 101-107, 1979. 4 Fig, 2 Tab, 26 Ref.

Descriptors: *Salinity, *Toxicity, *Respiration, Fish physiology, Animal metabolism, Osmosis, Oxygen requirements, Fish behavior, Dissolved oxygen, Cycles, Salt tolerance, *Blenny, *Blennius, *Tissue analysis, *Blood chemistry, *Ventilation rates, *Acclimation.

Blennius pholis (L.) were exposed to fluctuating salinity regimes of near tidal periodicity and their blood osmolality, oxygen consumption, heart rate and opercular beat monitored. Despite salinity fluctuations from 34-0-34 o/ooS, the blood osmolality remained constant. Significant increases in oxygen consumption were observed at low salinity levels, but these may simply reflect changes in physical activity and the greater availability of oxygen at low salinities. Salinity effects upon heart rate/opercular beat were weak or negligible. (Deal-EIS)

BENTHIC INVERTEBRATES OF THE LOWER MISSISSIPPI RIVER,
Geological Survey, Baton Rouge, LA.
F. C. Wells, and C. R. Demas.
Water Resources Bulletin, Vol 15, No 6, 1565-1577, 1979. 3 Fig, 1 Tab, 25 Ref.

Descriptors: *Benthic fauna, *Mississippi River, *Biological communities, Aquatic populations, Dominant organisms, Worms, Insects, Diptera, Clams, Isopods, Mollusks, Mayflies, Amphipoda, River flow, Aquatic habitats, Water chemistry, Industrial wastes, Municipal wastes.

In 1976-77, benthic invertebrates were sampled at four sites in a 410 kilometer reach of the lower Mississippi River to define the communities in the river and to determine differences between communities upstream and downstream from the industrial and municipal complexes of Baton Rouge and New Orleans, Louisiana. The most common and most numerous organisms collected were Corbicula and tubificid worms. The benthic community structure of the lower Mississippi River is influenced by substrate type and stability, channel geometry, river velocity, vegetation and organic detritus, and salinity. Sampling stations near the left and right banks had low velocities, and substrate types ranged from medium silt to very fine sand. Burrowing organisms such as tubificids, chironomids, and ephemerid-type mayflies dominated these environments. At the center, left-center, and right-center stations, velocities were higher and substrate materials were coarser than at the bank stations; only Corbicula was present in large numbers. Near the river mouth, salinity and aquatic vegetation greatly affect the benthic community structure. Differences in benthic community structure in the Mississippi River are due primarily to different hydrologic conditions. Industrial and municipal wastes discharged into the river appear to have little or no widespread effects on benthic populations. (Deal-EIS)

EVALUATION OF CUTRINE FOR USE IN FISH CULTURE,
New York State Dept. of Environmental Conservation, Rome.
J. C. Skea, and H. A. Simonin.
The Progressive Fish Culturist, Vol 41, No 4, p 171-174, 1979. 5 Tab, 7 Ref.

Descriptors: *Algicides, *Toxicity, *Bass, *Minnows, Copper compounds, Bioassay, Mortality, Fish management, Fish hatcheries, Aquatic algae, Water chemistry, Cladophora, *Cutrine.

Laboratory and field tests were conducted with Cutrine, a chelated copper algicide registered for use in fish hatcheries. The 96-h LC50 for fingerling largemouth bass (Micropterus salmoides) was found to be 70 microl/l Cutrine (6.4 mg/l Cu) at 21.1C and 2.3 microl/l (0.21 mg/l Cu) for fathead minnows (Pimephales promelas) at 18.3C. When Cutrine was applied at a rate of 2.3 microl/l (0.75 gal/A-ft) to half of a rearing pond for fathead minnows, the amount of filamentous algae was substantially reduced. Caged largemouth bass and fathead minnows showed less than 10% mortality in the treated area of the pond. (Deal-EIS)

SAPROLEGNIA: CONTROL OF FUNGUS ON INCUBATING EGGS OF PINK SALMON BY TREATMENT WITH SEAWATER,
National Marine Fisheries Service, Auke Bay, AK. Auke Bay Lab.
S. G. Taylor, and J. E. Bailey.
The Progressive Fish-Culturist, Vol 41, No 4, p 181-183, 1979. 3 Tab, 6 Ref.

Descriptors: *Fish eggs, *Fungicides, *Pink Salmon, *Sea water, Fish management, Fish hatcheries, Mortality, Fish diseases, Disinfection, Growth stages, *Saprolegnia, *Malachite green.

Daily 2- to 3-h treatments with seawater safely and effectively controlled Saprolegnia diclina on eggs of pink salmon (Oncorhynchus gorbuscha) in two trials at Auke Creek Hatchery, southeastern Alaska. Survival in gravel incubators from the fertilized-egg stage to the fry stage was significantly higher (P+0.005) with seawater treatment (68%) than with no treatment (41%). In tray incubators, survival from the fertilized-egg stage to the eyed-egg stage averaged 95% for the 1971 to 1976 broods after malachite green treatments and 96% for the 1977 brood after seawater treatments. (Deal-EIS)
W80-03336

IODOPHOR DISINFECTION OF MUSKELLUNGE EGGS UNDER INTENSIVE CULTURE IN HATCHERIES,
New York State Dept. of Environmental Conservation, Rome.
J. H. Schachte, Jr.
The Progressive Fish Culturist, Vol 41, No 4, p 189-190, 1979. 1 Tab, 6 Ref.

Descriptors: *Disinfection, *Fish hatcheries, *Fish management, Iodine, Pikes, Fish eggs, Toxicity, Mortality, Fish reproduction, Pathogenic bacteria, Bactericides, Fish diseases, *Iodophors.

The iodophor Povidone-Iodine (1% active I2) was used at three concentrations, 100, 28, and 13 mg/l(1:100, 1:350, and 1:750) for 10 min. in an attempt to disinfect fertilized eggs of muskellunge (Esox masquinongy) and to test the efficacy and toxicity of the compound on the eggs of cool-water species. No treatment effect was observed between treatments and controls or among treatments. However, no toxic effects of the iodophor were found at the concentrations of active I2 considered efficacious for salmonids. (Deal-EIS)
W80-03337

INHIBITION OF CARBON FIXATION AS A FUNCTION OF ZINC UPTAKE IN NATURAL PHYTOPLANKTON ASSEMBLAGES,
Marine Biological Association of the United Kingdom, Plymouth (England). Plymouth Lab.
A. G. Davies, and J. A. Sleep.
Journal of the Marine Biological Association of the United Kingdom, Vol 59, p 937-949, 1979. 2 Fig, 4 Tab, 29 Ref.

Descriptors: *Zinc, *Inhibition, *Photosynthesis, *Phytoplankton, Radiochemical analysis, Tracers, Zinc radioisotopes, Carbon radioisotopes, Chlorophyll, Absorption, Mode of action, Plant physiology, Toxicity, Heavy metals, Analytical techniques, *Tissue analysis, *Bioaccumulation.

By developing a method for discriminating between the radioactivities of 14C and 65Zn, it has proved possible to measure the influence of zinc upon the carbon fixation rates of natural phytoplankton communities as a function of both the zinc concentrations in the water and the zinc/chlorophyll a ratios in the plant cells. Photosynthesis in the phytoplankton assemblages in the English Channel during July 1978 was found to be inhibited at zinc concentrations which have been reported to be present in the waters of some other coastal regions around the British Isles. Zinc/chlorophyll a ratios in the phytoplankton were related to the zinc levels in the water by an expression analogous to the Langmuir adsorption isotherm and, presumably due to the near saturation of the zinc binding sites in the plant cells, began to approach their maximal values at zinc concentrations above about 30 microg/l. As the carbon fixation rates were linearly correlated with the zinc/chlorophyll a ratios, these too began to level-off at about the same concentration, higher zinc values causing very little further inhibition. The experimental data are shown to be in good agreement with an expression which describes the effect of zinc upon carbon fixation rates in phytoplankton simply in terms of the zinc binding capacity of the cells and the zinc concentration in the water. This indicates that, as in cultures, the growth rates of natural phytoplankton are also governed by the cellular contents of rate-limiting constituents rather than by the concentrations in the water. (Deal-EIS)
W80-03340

A COMPARATIVE STUDY OF THE CLOSURE RESPONSES OF SOME CIRRIPEDE SPECIES EXPOSED TO FALLING SEAWATER CONCENTRATIONS,
Natural Environment Research Council, Bangor (Wales). Marine Invertebrate Biology Unit.
D. F. Cawthorne.
Journal of the Marine Biological Association of the United Kingdom, Vol 59, p 811-817, 1979. 5 Fig, 12 Ref.

Descriptors: *Animal behavior, *Salinity, Salt tolerance, Habitats, Adaptation, Animal physiology, Sea water, Estuarine environment, Osmosis, Membrane processes, Physiological ecology, *Barnacles.

The closure response to low external salinity of three species of intertidal and estuarine barnacle (Balanus balanoides, B. crenatus and Elminius modestus) when exposed to various rates of salinity change were investigated. Comparisons were made between the responses of specimens collected from estuarine and coastal sites. In addition the responses of the brackish water barnacle Balanus improvisus were measured. Three species, B. crenatus, B. improvisus and E. modestus showed no sensitivity to rate of salinity change except at extremely high and unphysiological rates of concentration change. B. balanoides exhibited a sensitivity to rate of salinity change, closure occurring at lower sea water concentrations, with slow rates of change. There was no difference between the response of estuarine and coastal specimens of this species, whilst in B. crenatus and E. modestus, estuarine specimens closed at a significantly lower concentration for a given rate of salinity change. EUGLENACEA AND CHRYSOPHYCEAE AS ORGANISMS INVOLVED IN POLLUTION OF THE MARINE LITTORAL (IN FRENCH),
Institut Romania de Recherces Marines, Constantsa.
P. E. Mihnea.
In: IVes journees d'etudes sur les pollutions marines en Mediterranee, Commission Internationale Pour L'Exploration Scientifique De La Mer Mediterranee, Monaco, 24-27 Novembre 1978, Antalya, Turkey, p 471-475, 1979. 9 Fig, 4 Ref, (English summary).

Descriptors: Algae, Phytoplankton, Phosphates, Nutrients, Plant physiology, Marine algae, Water pollution effects, Nutrients, Biochemical oxygen demand, Laboratory tests, Bioassays, Growth, Water temperature.

Both the frequency and the biological cycle of Euglenaceae and Chrysophyceae, as well as their correlation with environmental conditions, are analysed. The optimum temperature, positive correlation with CB05, P-P04, and the ratio N/P; all explain the occurrence and the development of the unicellular algae groups studied. The relationship of these algae to the environmental variables explain their role in the purification of the marine littoral. Algae demonstrate their ability to adapt to a wide range of water temperatures. (Katz-EIS)

MEIOFAUNA DEVELOPMENT ON ARTIFICIAL SOFT BOTTOMS IN KIEL BAY (IN GERMAN),
Kiel Univ. (Germany, F.R.). Zoologisches Inst.
W. Scheibel, and H. Rumohr.
Helgolander wissenschaftliche Meeresuntersuchungen, Vol 32, p 305-312, 1979. 5 Fig, 2 Tab, 9 Ref, (English summary).

Descriptors: *On-site tests, *Dominant organisms, Biological communities, Nematodes, Benthic fauna, Sediments, Aquatic populations, Biomass, Analytical techniques, Research equipment, *Colonization, *Harpacticoides, *Baltic Sea.

The 'Benthosgarten', an enclosed area in the western Baltic Sea, is used for benthos ecology experiments. It consists of different kinds of sediment containers filled with 'artificial' soft bottom. These containers were sampled by divers over a one-year period to observe the development of the meiofauna population. The first settlement, mainly by nematodes, took place immediately after exposure, and six months later the population was stabilized. The meiofauna consists mainly of nematodes and harpacticoides. Biomass and density are generally lower than in the surrounding area. Only the har-

pacticoid fauna is well represented by different species and has more individuals per sqm than the surrrounding area. Biological aspects of the specific features of the sediment containers, e.g. size and their distance to the sea bottom are discussed. (Deal-EIS)

TRACE ELEMENT RELEASE FROM ESTUARINE SEDIMENTS OF SOUTH MOSQUITO LAGOON NEAR KENNEDY SPACE CENTER,
Savannah State Coll., GA.
M. P. Menon, G. S. Ghuman, and C. O. Emeh.
Water, Air, and Soil Pollution, Vol 12, No 3, p 295-306, October 1979. 3 Fig, 3 Tab, 25 Ref. NASA NSG803.

Descriptors: *Analytical techniques, *Chemical analysis, *Trace elements, *Metals, Lagoons, Sediments, Sampling, Laboratory tests, Ions, Zinc, Manganese, Cadmium, Copper, Pollutants, Pollutant identification, Water pollution, Estuaries.

Analytical partitioning of four trace metals in estuarine sediments collected from eight sites in South Mosquito Lagoon, near Kennedy Space Center, in terms of four different categories was accomplished using four different extraction techniques. The concentrations of the four trace metals, Zn, Mn, Cd, and Cu, released in interstitial water extract, 1 N ammonium acetate extract, conc. HCl extract, and fusion extract of sediments as well as their concentrations in water samples collected from the same location were determined using flame atomic absorption technique. From the analytical results the percentages of total amount of each metal distributed among four different categories, interstitial water phase, acetate extractable, acid extractable, and detrital crystalline material, were determined. Our results suggested that analytical partitioning of trace metals in estuarine sediments may be used to study the mechanism of incorporation of trace metals with sediments from natural waters. A correlation between the seasonal variation in the concentration of acetate-extractable trace metals in the sediment and similar variation in their concentration in water was observed. A mechanism for the release of trace metals from estuarine sediments to natural water was also suggested. (Sims-ISWS)

ORGANIC QUALITIES OF GROUNDWATERS,
Arizona Univ., Tucson. Dept. of Civil Engineering.
D. R. Kasper, and K. S. Knickerbocker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-147267, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Center, University of Arizona. Project Completion Report, February 1980. 15 p, 3 Fig, 3 Tab, 5 Ref, OWRT A-067-ARIZ(1), 14-34-0001-6003.

Descriptors: *Organic wastes, *Percolation, Groundwater, *Activated sludge, Path of pollutants, Sampling, Water wells, Water analysis, Water supply, *Colorform extract method, Groundwater organics, Wastewater recharge, Groundwater quality, Tucson(Ariz).

The total organic content or recharged secondary effluents as measured by the miniaturized carbon chloroform extract method (CCE-m) was investigated by analyzing waters from wells located at various distances from recharge areas. It was found that the CCE-m organic concentration decreased with increasing percolation distance. Secondary activated sludge effluent was found to contain 3.80 mg/l CCE-m. Percolation through 100 feet of porous media reduced the CCE-m value to less than 0.50 mg/l. This is less than the EPA proposed 1974 Drinking Water Standard of 0.70 mg/l. Fourteen wells located a minimum of 1,000 feet from an ephemeral stream receiving secondary effluent had CCE-m values less than 0.20 mg/l. A general survey of deep wells known not to receive any wastewater recharge found CCE-m values varying from 0.04 to 0.30 mg/l. It is probable that the oil lubrication methods employed in deep wells resulted in these CCE-m values.

LONGEVITY AND REPRODUCTION OF DAPHNIA PULEX (DE GEER) EXPOSED TO CADMIUM-CONTAMINATED FOOD OR WATER,
Wisconsin Univ.-Milwaukee. Center for Great Lakes Studies.
P. E. Bertram, and B. A. Hart.
Environmental Pollution, Vol 19, p 295-305, 1979. 4 Fig, 2 Tab, 18 Ref. OWRT A-023-VT(2).

Descriptors: *Cadmium, *Toxicity, *Daphnia, Chlorella, Chlorophyta, Reproduction, Life history studies, Fertility, Fecundity, Heavy metals, Path of pollutants, Absorption, Crustaceans, Chemical analysis, *Tissue analysis, *Bioaccumulation.

The effect of cadmium on the survival and reproductive capacity of Daphnia pulex was determined. Cadmium was present either in the water at chronic (1-30 microgram Cd/litre) and acute (40-90 microgram Cd/litre) levels or in the algal food source, Chlorella pyrenoidosa. The average longevity of D. pulex was not affected by exposure to 1 microgram Cd/litre but it was reduced in a dose-dependent manner between 5 and 30 microgram Cd/litre. Exposure to cadmium had no effect on the number of days to onset or frequency of reproduction but it did cause a reduction in the percentage of adults producing young, the number of broods per adult, the number of young per brood, the number of progeny per adult, the intrinsic rate of natural increase (r), and the mean generation time (T). Cadmium-laden Chlorella caused the same effects as did exposure to 1 microgram Cd/litre. (Deal-EIS)

MODIFIED AMPEROMETRIC MEMBRANE PROBES FOR DETERMINING FREE AND TOTAL RESIDUAL CHLORINE IN SALINE COOLING WATERS,
Central Electricity Generating Board, Leatherhead (England). Research Labs.
N. A. Dimmock, and D. Midgley.
Water Research, Vol 13, No 12, p 1317-1327, 1979. 7 Fig, 2 Tab, 9 Ref.

Descriptors: *Chlorine, *Cooling water, *Instrumentation, Equipment, Chemistry, Salinity, Potassium compounds, Hydrogen ion concentration, Chemical reactions, Water chemistry, Chemical analysis, Electrodes, Membrane probes.

Modifications have been made to a Delta Scientific model 82124 free available chlorine probe so that it can be used to determine either the free or the total residual chlorine in cooling waters at coastal and estuarine power stations. For measurements of free residual chlorine, the internal filling solution of the probe was changed for one containing potassium bromide at pH 4. When the sample solution was dosed with potassium bromide and pH 4 buffer, the probe had a linear response over the range 0.04-1.0 microgram/milliliter C12, and errors caused by changes in salinity were negligible. Total standard deviations for the analysis of 1.0 and 0.1 microgram/milliliter C12 solutions were 0.055 and 0.01 microgram/milliliter C12, respectively. For measurements of total residual chlorine a potassium iodide solution at pH 4 was used as the probe's internal filling solution, and the sample solution was dosed with potassium iodide and pH 4 buffer. The probe had a linear response over the range 0.02-0.5 microgram/milliliter C12, with total standard deviations of 0.05 and 0.01 microgram/milliliter C12 at concentrations of 0.5 and 0.1 microgram/milliliter C12, respectively. AN AUTOMATED PROCEDURE FOR THE DETERMINATION OF PHOSPHORUS,
Foras Forbartha, Dublin (Ireland).
L. J. Lennox.
Water Research, Vol 13, No 12, p 1329-1333, 1979. 4 Fig, 4 Tab, 6 Ref.

Descriptors: *Analytical techniques, *Chemical analysis, *Phosphorus, *Water chemistry, Chemistry, Water pollution, Pollutants, Nutrients, Pollutant identification, Phosphorus compounds, Sewage, Sewage effluents, Fertilizers, Rivers, Lakes, Reservoirs.

Procedures for the determination of dissolved orthophosphate and total phosphorus in surface fresh waters (e.g., rivers, lakes, and reservoirs) and organic wastes (e.g., domestic sewage, creamery effluents, and the like) (particulate or dissolved) were described. Total phosphorus compounds were converted to orthophosphate by acid persulfate digestion. The digestion time was 3 h which goes to completion without any supervision. The method allowed for a maximum of 36 samples, 2 blanks, and 2 standards to be processed simultaneously. There was no pH adjustment required. Interference from silica and iron (III) up to 20 mg/l was absent. Detection limits for the automated step involving orthophosphate were 1 microgram/liter. Recovery and effectiveness of proposed procedures were excellent. (Sims-ISWS)

HUMIC AND FULVIC ACIDS AS INDICATORS OF SOIL AND WATER POLLUTION,
Department of Agriculture, Ottawa (Ontario). Chemistry and Biology Research Inst.
H. Kerndorff, and M. Schnitzer.
Water, Air, and Soil Pollution, Vol 12, No 3, p 319-329, October 1979. 6 Fig, 7 Tab, 20 Ref.

Descriptors: *Indicators, *Water pollution, *Soil contamination, *Humic acids, *Fulvic acids, Sampling, Surveys, Sediments, Pollutants, Pollutant identification, Chemicals, Chemical analysis, Analytical techniques, Carbon, Hydrogen, Nitrogen, Sulfur, Oxygen, Statistical analysis, Data processing.

Humic substances are the major organic components of soil and sediments, but little is known on how they are affected by environmental and industrial pollution. To find out whether such effects could be recognized, a number of analytical characteristics were compared of humic and fulvic

acids extracted from unpolluted and polluted soils and sediments. The main differences were that, per unit weight, polluted humic and fulvic acids contained more N, S, and H but fewer C02H groups, and were more aliphatic than unpolluted samples. Unusually high N and S contents of humic materials appear to be the most valid indicators of pollution. Humic acids are preferred to fulvic acids as indicators of pollution because the former are more readily separated and purified. (Sims-ISWS)

AERIAL INPUTS OF CADMIUM, COPPER, LEAD, AND MANGANESE INTO A FRESHWATER POND IN THE VICINITY OF A COAL-FIRED POWER PLANT,
Savannah River Ecology Lab., Aiken, SC.
J. G. Wiener.
Water, Air, and Soil Pollution, Vol 12, No 3, p 343-353, October 1979. 5 Tab, 54 Ref. DOE EY-76-C-09-0819.

Descriptors: *Chemistry of precipitation, *Metals, *Air pollution, *Water pollution sources, *Powerplants, *South Carolina, Fly ash, Coals, Sampling, Rainfall, Precipitation(Atmospheric), Laboratory tests, Chemical analysis, Cadmium, Copper, Lead, Manganese, Data processing, Regression analysis.

Cadmium, Cu, Mn, and Pb were analyzed in bulk precipitation for 21 months at a 2-ha pond, located 5.5 km northwest of an 83 MW coal-fired power plant in South Carolina. No significant changes in mean concentrations of the four metals in bulk precipitation were observed after installation of modern electrostatic precipitators on the stacks of the power plant, which previously had been equipped with mechanical cyclone collectors for removal of fly ash. Hence, fly ash from stack emissions was apparently not a major source of aerially deposited trace metals at the pond site. Annual imputs of the four metals in bulk precipitation at the pond were similar to values reported for other rural areas in North America. Enrichment factors, with Mn as a reference element, indicated that Cd, Cu, and Pb in bulk precipitation were not derived from soil or crustal material. Cadmium, Cu, and Pb were enriched in all samples of bulk precipitation relative to their abundances in local soils and were most enriched during autumn and winter. A multiple regression procedure suggested that wetfall was the primary mode of aerial deposition of Cd and Cu, whereas both wetfall and dryfall were important modes of aerial deposition of Pb. IMPACT OF NUTRIENT ENRICHMENT IN A WATERCHESTNUT ECOSYSTEM AT TAKAHAMA-IRI BAY OF LAKE KASUMIGAURA, JAPAN--I. NUTRIENT INFLUX AND PHYTOPLANKTON BLOOM,
Tsukiba Univ., Ibaraki (Japan). Inst. of Biological Sciences.
H. Seki, M. Takahashi, and S. Ichimura.
Water, Air, and Soil Pollution, Vol 12, No 3, p 383-391, October 1979. 9 Fig, 19 Ref.

Descriptors: *Algae, *Eutrophication, *Lakes, *Nutrients, Water pollution effects, Agricultural runoff, Agricultural chemicals, Farm wastes, Fertilizers, Water pollution, Pollutants, Water temperature, Chlorophyll, Dissolved oxygen, Bacteria, Phosphates, Nitrogen compounds, Phytoplankton, Sampling, Limnology, *Japan.

The heaviest algal bloom that can be expected in an aquatic system was formed in a waterchestnut ecosystem in Lake Kasumigaura during the summer in 1978 when the water temperature was greater than 30C, caused by the nutrient discharges from the River Koise and the River Sanno. The heavy bloom not only threatens the steady-state equilibrium of the eutrophic system of the lake but also must accelerate the lake transformation into a low moor by forming ooze on the lake bottom with the precipitation of a large amount of dead blue-green algae. PRODUCTION OF HALOFORM PRECURSORS BY WATER PIPE BACTERIAL FILMS.
Missouri Univ.-Rolla. Dept. of Civil Engineering.
D. B. Jacquez, and D. K. Muckerman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-147002, Price codes: A04 in paper copy, A01 in microfiche. Missouri water Resources Research Center, University of Missouri. Completion Report. November 1979. 61 p, 12 Fig, 10 Tab, 25 Ref. USDI-OWRT-14-34-0001-9027, A-108-MO (1).

Descriptors: Bacteria, Chlorination, *Trihalomethanes, Chloroform, Slime.

The objective of this investigation was to determine the potential for bacteria films coating the interior of water distribution lines to act as organic precursors to the formation of trihalomethanes (THMs). Experiments were conducted in a static manner by chlorinating one foot sections of four inch diameter cast iron pipe which contained a film of bacteria native to the Rolla, Mo tap water system. A water pipe bacterial film was demonstrated to act as an organic precursor by chlorinating a set of pipes with and without a bacterial film. A clean pipe and a chlorine dose of 2.5 mg/l established a 24 hour baseline total THM (TTHEM) production level of 4 ug/1 for the Rolla tap water. Including the bacterial aline growth increased the TTHM level to 19 ug/1 at a chlorine dose of 2.9 ug/1. Further increasing the chlorine dose to 94 mg/1 produced a TTHm level of 86 ug/1 at the end of 24 hours. The pH of the Water was shown to have a definite influence on THM production. At a chlorine dose of 0 mg/1, varying the pH from 5.3 to 8.7 increased TTHM production from six to 98 ug/1 during a 24 hour test. Throughout the investigation, chloroform was found to be the predominant THM specie. The average breakdown of THM species resulting from the chlorination of bacterial films can be summarized as follows: 79% chloroform, 17% bromodichloromethane, and four % dibromochloromethane. Bromoform was present, but usually at concentrations less than one ug/1.

ENVIRONMENTAL PATH OF ARSENIC IN GROUNDWATER,
Alaska Univ., Fairbanks. Inst. of Water Resources.
D. B. Hawkins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-143662, Price codes: A02 in paper copy, A01 in microfiche. Report No IWR-77, 1976. 7 p, OWRT A-050-ALAS (2), 14-34-0001-6002.

Descriptors: *Arsenic, *Alaska, *Path of pollutants, *Groundwater, Streams, Mining, *Ester Dome area(Alaska), *Pedro Dome-Cleary Summit area(Alaska).

This study determined the arsenic concentration in water of the Fairbanks Mining District. Stream waters had a mean of 24 parts per billion (ppb) of arsenic, and a maximum of 1200 ppb in the Pedro Dome-Cleary Summit area. A positive correlation of arsenic content of stream water and that of suspended and bottom sediment was demonstrated. Significant arsenic contamination of domestic well waters was also revealed in the Ester Dome area. Thirty to 50 percent of the 100 wells sampled had concentrations of arsenic over 50 ppb. The U.S. Public Health Service recommends a limit of 10 ppb, and rejects water with 50 ppb arsenic as a public water supply. The relationships between arsenic contamination and both mining activity and gold mineralization are discussed.
W80-03303

A STUDY OF THE CHARACTERISTICS AND POLLUTION POTENTIAL OF LAND SPREAD DOMESTIC SEPTAGE ON GROUNDWATER QUALITY,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
G. R. Beehler, and J. A. Moore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-143670, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Center, University of Minnesota Report, January 1980. 48 p, 6 Fig, 28 Tab, 26 Ref, 2 Append, OWRT A-036-MINN (1).

Descriptors: *Septic tank sludge, *Soil treatment, *Water pollution effects, Septage spreading, Infiltration, Groundwater, Path of pollutants.

A three-year study was undertaken to establish the characteristics of septage in Minnesota and to evaluate the effects of land spreading of domestic septage on groundwater nitrate concentration and microbial penetration. TS, TVS, pH, COD, NH3-N, TKN, conductivity and fecal coliforms were examined on 75 samples from two septage haulers. Large variations were noted in all parameters with septage in the Brainerd area possessing mean values 50% lower than septage in the White Bear Lake area. Seven virgin plots were identified and two types of application were proposed. Intermittent spreading imitated actual spreading practices and received + 3,000 gallons per plot per day. Slug loads were utilized to maximize the hydraulic load and pollution potential of the septage applied. Four plots of intermittent loading received 174,000, 169,000, 32,000 and 39,000 gallons of septage during the three-year study. This gallonage represented a total nitrogen application equivalent to 2,400, 1,100, 630 and 290 lbs N/acre. No significant increase in well water nitrates was observed. Slight increases of nitrate nitrogen concentrations were observed in the soil profiles, most notably at the heaviest application of nitrogen applied. Slug loads of 200 to 2,000 gallons per single application on 10 foot x 50 foot plots failed to increase well water nitrate concentrations and only infrequent instances of fecal coliform recovery accurred. These may represent sporadic penetration or be of an iatrogenic source and may or may not be a significant finding. (Blake-Minn)

ACCUMULATION, ELIMINATION, AND METABOLISM OF DICHLOROBENZIDINE IN THE BLUEGILL SUNFISH,
Syracuse Research Corp., NY. Life Sciences Div.
H. T. Appleton, and H. C. Sikka.
Environmental Science and Technology, Vol 14, No 1, p 50-54, 1980. 6 Tab, 22 Ref.

Descriptors: *Animal metabolism, *Sunfishes, *Organic compounds, Absorption, Chemical properties, Chemical wastes, Carbon radioisotopes, Tracers, Fish physiology, Path of pollutants, Public health, *Carcinogens, *Tissue analysis, *Bioaccumulation, *Dichlorobenzidine(DCB).

The bioconcentration, elimination, and metabolism of 3,3'-dichloro-benzidine (DCB), a suspected human carcinogen, were investigated in bluegill sunfish. (14C)DCB was rapidly accumulated by the fish from water containing 5 ppb or 0.1 ppm of the chemical. Based on total 14C residues, bioconcentration factors of 495 to 507 were observed in the whole fish with equilibria achieved in 96 to 168 h. The 14C residues were distributed in both the edible and nonedible portions. (14C)DCB or its metabolites were not completely eliminated upon transfer of the fish to water free of dichlorobenzidine. The only metabolite detected in the fish was an acid-labile conjugate of DCB, which appears to be an N-glucuronide. The ability of DCB to concentrate in aquatic organisms may present a direct hazard to human health through consumption of contaminated fish. (Deal-EIS)
W80-03334

TWO HEAVY METAL-BINDING PROTEINS IN THE MIDGUT GLAND OF THE CRAB CARCINUS MAENAS,
Queen Mary Coll., London (England). Dept. of

Zoology and Comparative Physiology.
P. S. Rainbow, and A. G. Scott.
Marine Biology, Vol 55, p 143-150, 1979. 4 Fig, 6 Tab, 29 Ref.

Descriptors: *Crabs, *Proteins, *Heavy metals, Biochemistry, Animal metabolism, Animal physiology, *Cadmium, *Zinc, *Copper, *Lead, Path of pollutants, Chemical properties, *Tissue analysis, *Bioaccumulation, *Midgut gland.

Two heavy metal-binding proteins occur naturally in the midgut glands of Carcinus maenas (L.) collected from the Firth of Clyde, Scotland. These proteins, of approximately 27,000 and 11,500 MW (molecular weight) have previously been described as Cd-binding proteins after their induction by high concentrations of cadmium in the laboratory. The approx. 27,000 MW heavy metal-binding protein is bound to about 0.10 g-25 of Cd, 0.70 g-at of Zn and 0.31 g-at of Cu per mole of protein; 7.7, 7.9 and 1.1%, respectively, of the soluble Cd, Zn and Cu in the midgut gland are associated with this approx. 27,000 MW protein (6.7, 1.6 and 0.9% of the total midgut gland Cd, Zn and Cu). The approx. 11,500 MW protein is bound to about 0.04 g-at of Cd, 0.37 g-at of Zn and 1.54 g-at of Cu per mole of protein; 29.3, 31.3

A COMPARISON OF THE AXIAL DISTRIBUTIONS OF SALT AND 137CS IN THE SEVERN ESTUARY DURING AUGUST 1974,
Institute for Marine Environmental Research, Plymouth (England).
R. J. Uncles.
Estuarine and Coastal Marine Science, Vol 9, No 5, p 585-594, November 1979. 4 Fig, 1 Tab, 12 Ref.

Descriptors: *Dispersion, *Estuaries, *Salinity, *Radioisotopes, Pollutants, Path of pollutants, Water pollution, Cesium, Salts, Powerplants, Nuclear powerplants, Water pollution sources, Sampling, Monitoring, Coasts, Tidal waters, Data processing, *United Kingdom, *Severn estuary(UK).

A comparison was made of the axial distributions of salt and dissolved 137Cs in a seaward section of the Severn estuary during August 1974. It was shown that these variables were distributed with essentially the same axial dispersion coefficient, and that conditions were effectively stationary. It was also shown that the flushing of 137Cs from the estuary during this period was mainly due to the axial dispersion. The observed concentrations of 137Cs were the linear summation of those due to the northeast Celtic Sea and freshwater background levels (0.65 0.06 pCi/l and approximately 0.08 pCi/l respectively), together with those produced by the three nuclear power generating stations which discharge 137Cs into the estuary. The levels due to the Celtic Sea background amounted to roughly 50% of the observed values, taken as an average over the study area; the levels due to the freshwater background were negligible. Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15118, p 151-172, January 1980. 9 Fig, 30 Ref, 1 Append.

Descriptors: *Dispersion, *Rivers, *Mixing, *Model studies, Mathematical models, Pollutants, Path of pollutants, Water pollution, On-site data collections, Calibrations, Streams, Streamflow, Turbulence, Hydraulics.

To explain the frequent deviation of longitudinal dispersion observations in rivers from the Fickian dispersion theory, a two-parameter model was developed. This model was based on reevaluation of the mixing length concept and the assumption that the characteristic irregularity of rivers retards the onset of the Fickian process. The model suggested that there are three distinct dispersion ranges. Within a characteristic stream length from the source, the temporal spread of the dispersing cloud increases linearly with distance; concentration-time curves at different locations along the stream are similar and can be predicted if a dimensionless coefficient is known. The Fickian process occurs at distances exceeding about three times the characteristic stream length. Transitional behavior occurs in the intermediate range. Published field data were analyzed to test the model and evaluate the dispersion parameters. The river length marking onset of Fickian dispersion was found to be up to 30 times that of a corresponding prismatic channel; it was estimated that Fickian dispersion is not likely to occur within lenghts of practical interest in any but small streams. THE SURVIVAL OF COLIFORM BACTERIA IN SALINE SEDIMENTS,
New South Wales Univ., Kensington (Australia). School of Microbiology.
M. M. Roper, and K. C. Marshall.
Australian Water Resources Council Technical Paper No 43, 1979. 73 p, 46 Fig, 2 Tab, 77 Ref.

Descriptors: *Coliforms, *E. coli, *Sewage bacteria, *Sediments, Water quality, *Australia, Biocontrol, Bacteriophage, Saline water, Colloids, Bacteria, Animal parasites, Amoebae, Montmorillonite, Clays.

Studies in the Tamar and Georges Rivers in Australia indicate: (1) that coliform bacteria were deposited in bottom muds when the electrolyte concentration (salinity) exceeded a critical conductivity of .25 mmhos cm, and (2) that sediment particulates prolong the survival of the bacteria. Research revealed that biological parasites (bacteriophage, Bdellovibrio), lytic bacteria (Polyangium), and predatory amoebae (Vexillifera) are the major biological agents that rapidly destroy faecal bacteria in natural waters. A colloidal envelope formed around E. coli appears to protect the bacteria from attack. Anaerobic conditions encountered below the sediment-water interface inhibit some agents but not bacteriophage. Dilution of the electrolyte beyond the critical concentration causes the E. coli and other organisms to be desorbed and the sediment colloids to be dispersed. In saline lagoons and estuaries, which are subjected to changes in salinity, E. coli and possibly other faecal microorganisms could present a health hazard if desorbed by dilution as a result of heavy rainfall. TRIAZINE RESIDUES IN A WATERSHED IN SOUTHWESTERN ONTARIO (1973-75),
Ontario Ministry of Agriculture and Food, Guelph. Pesticide Residue Lab.
G. C. Roberts, G. J. Sirons, R. Frank, and H. E. Collins.
Journal of Great Lakes Research, Vol 5, No 3-4, p 246-255, 1979. 1 Fig, 7 Tab, 11 Ref.

Descriptors: *Agricultural runoff, *Herbicides, *Pesticide residues, *Triazine pesticides, Organic pesticides, Watersheds(Basins), Water sampling, Clays, Water pollution sources, Pesticide removal, Lake Erie, Ontario, Erosion, Agricultural watersheds.

Creek water from sites on the lower reaches of Hillman Creek in southwestern Ontario was tested to investigate the movement of triazine, a herbicide, in the stream. Hillman Creek drains into Lake Erie from a watershed of 4500 ha. The watershed is largely sandy loam soils with podsolic clay subsoils. Questionnaire results from a farm-to-farm survey in the watershed indicate that 30% of the cropland was treated with s-triazine in 1973 and 1974. During these years water samples were taken from six sites and in 1974 and 1975 26 sites were sampled. Integrated samples of 3 to 4 liters were

taken at each site and flow data were used to calculate herbicide loadings. Three fish species, gizzard shad, black crappie, and brown bullheads, were also tested. Results show that triazines residues were consistently higher upstream than downstream. Specific residues were found in the following percentages of samples: atrazine 89%, desethylatrazine 51%, Simazime 37%, metribuzin 4.4% cyanazine 0.6%, and cyprazine 0.3%. A high of 34.7 micrograms/l Simazime was observed for June and July. Overall only a small fraction (0.3% to 2%) of the applied herbicides reached the stream. Transfer occurs during runoffs and is not connected to steady leaching. Most trazines are adsorbed by clay colloids and organic matter. No triazine herbicide residues were found in the fish analyzed. Broadleaf and annual grasses are expected to be the most triazine susceptible aquatic plants. (Seigler-IPA)

EXECUTIVE SUMMARY OF THE REPORT 'SURFACE IMPOUNDMENTS AND THE EFFECTS OF GROUND WATER QUALITY IN THE UNITED STATES--A PRELIMINARY SURVEY'.
Geraghty and Miller, Inc., Tampa, FL.
EPA Report No EPA-570/9-78-005, June, 1978, 30 p, 1 Fig, 1 Tab.

Descriptors: *Impoundments, *Ground water, *Water quality, Surface water, Water pollution control, Ponds, Lagoons, Seepage, Farm wastes, Industrial wastes, Municipal wastes, Waste disposal, Surveys.

This report summarizes the results of an investigation of the use of municipal, industrial, and agricultural surface impoundments in the United States, with particular reference to the potential threats they may pose to the quality of underground dringking water resources and to methods of controlling or abating such threats. The principal subjects covered in the investigation are: (1) numbers, types and uses of impoundments, (2) chemical characteristics of the impounded wastes, (3) mechanisms by which wastes that seep from impoundments may contaminate ground water, (4) selected case history data on ground water contamination, (5) technical controls and costs for preventing and alleviating contamination, and (6) state regulatory controls over the use of impoundments. (Purdin-NWWA)

MIGRATION OF RADIONUCLIDE CHAINS IN GROUND WATER,
Ford, Bacon and Davis Utah, Inc., Salt Lake City.
V. C. Rogers.
Nuclear Technology, Vol 40, No 10, p 315-320, October, 1978. 5 Fig, 1 Tab, 7 Ref.

Descriptors: *Radioisotopes, *Migration, *Ground water, Diffusion, Mass transfer, Uranium radioisotopes, Radium radioisotopes, Equations.

Expressions are presented for determining the maximum concentrations and discharge rates of radioactive nuclide chains migrating by flowing ground water. Nuclide migration is determined from a second-order differential mass balance equation that considers longitudinal dispersion, convection, sorption, and radioactive decay. These expressions are presented for two-member chains that quantify the reconcentration effect in terms of dimensionless parameters. These parameters demonstrate the interrelationships between the basic nuclide and adsorbing medium parameters. The reconcentration effect for the third member of three-member chains is adequately described by the two-member expressions, except the range of reconcentration is extended. This approach provides a relatively simple method of determining an upper limit to the concentrations or release rates of parent and daughter radionuclides in ground water. (Purdin-NWWA)

A sensitive method for the determination of organic bound chlorine in river water has been used in a monitoring program. The amount of organic bound chlorine, extracted by cyclohexane and determined by neutron activation analysis, was chosen as a parameter for detection and tracing of pollutants with annoying or harmful properties. During one year, 216 samples, each collected continuously during 48 h, were taken at seven stations, located at 7-23 km distance along the Gota River, Sweden. The detection limit of the method was below 0.05 microgram Cl/l. Major sources of pollution were localized to certain sections of the river. (Sims-ISWS)

ONE-DIMENSIONAL TRANSIENT MODEL FOR SHORT-TERM PREDICTION OF DOWNSTREAM POLLUTION IN RIVERS,
Vienna Univ. (Austria). Inst. of Meteorology and Geophysics.
P. Kahlig.
Water Research, Vol 13, No 12, p 1311-1316, 1979. 4 Fig, 14 Ref, 1 Append.

Descriptors: *Dispersion, *Tracers, *Rivers, *Model studies, Mathematical models, Pollutants, Path of pollutants, Water pollution, Streams, Streamflow, Flumes, Laboratory tests, On-site investigations, Equations, Mathematics, Mixing, Hydrology.

Using an exact solution of Taylor's dispersion equation (including forced convection and a first-order removal process), the author derived a new routing procedure for short-term prediction of downstream pollution, and compared it to H.B. Fischer's wellknown method. An interaction between the dispersion and removal processes was demonstrated, and its usual negligible effect in river dispersion problems was justified. ROAD DE-ICING SALTS IN AN URBAN STREAM AND FLOOD CONTROL RESERVOIR,
Ontario HYDRO, Toronto.
W. S. Scott.
Water Resources Bulletin, Vol 15, No 6, p 1733-1742, December 1979. 7 Fig, 1 Tab, 10 Ref.

Descriptors: *Reservoirs, *Flood control, *Deicers, *Salts, *Canada, *Environmental effects, Highway effects, Water quality, Chlorides, Sodium, Runoff, Streams, Road salt.

High concentrations of chloride and sodium were found in the bottom layers of a new flood control reservoir at the beginning of winter thaw periods. The reservoir had a number of significant downstream impacts. After short thaw periods, discharge from the bottom of the reservoir tended to cause higher salt concentrations downstream in comparison with upstream sites. During long thaw periods or when large quantities of rain fell, downstream salt concentrations were considerably less than upstream values. Average chloride and sodium content of soil at the bottom of the reservoir more than doubled as a result of impounding runoff waters for one winter. (Visocky-ISWS)

WATER-QUALITY DATA FOR LANDFILLS, HILLSBOROUGH COUNTY, FLORIDA, JANUARY 1974-OCTOBER 1977,
Geological Survey, Tallahassee, FL. Water Resources Div.
M. Fernandez, Jr., and R. R. Hallbourg.
Geological Survey open-file report 78-820, 1979. 112 p, 5 Fig, 6 Tab, 2 Ref.

Descriptors: *Water quality, *Landfills, *Water analysis, *Groundwater, *Florida, Data collections, Path of pollutants, Observation wells, Well data, Chemical analysis, Metals, Trace elements, Nitrogen, Phosphorus, Coliforms, Herbicides, Pesticides, Chemical oxygen demand, Biochemical oxygen demand, *Hillsborough County(Fla).

Periodic water-quality data were collected at four landfills in Hillsborough County, Florida, from January 1974 through October 1977. Water samples were analyzed for nitrogen and phosphorus species, cations, trace metals, chloride, specific conductance, chemical oxygen demand, biological oxygen demand, and coliforms. Select groundwater samples were analyzed for herbicide and pesticide. Results of chemical and bacteriological analysis from four landfills are presented as basic data. Geologic logs and well descriptions are presented for wells drilled at the landfills after January 1974. (Kosco-USGS)

The chemical availability of heavy metals in street sweepings, stormwater solids, and sediments from an urban area was determined based on their solubility in Saddle River (New Jersey) water, exchangeability with ammonium acetate, and association with easily reducible manganese oxides, organic matter, and moderately reducible iron oxides. An average of less than 1% of the total metals in the solids studied were soluble in Saddle River water at pH 7.4. The concentration of metals in street sweepings and stormwater solids exchangeable with NH40Ac (pH 7.0) was significant and, in the case of lead and zinc, comprised more than 20% of the total concentration. An average of 16.7% of the metals in the solids studied were bound to organic matter, with copper being the most tightly bound. With the exception of manganese and copper in sediments of the Saddle River, the fraction associated with moderately reducible iron oxides accounted for greater than 50% of the total metal concentrations. (Sims-ISWS)

INVESTIGATION OF SANITARY LANDFILL BEHAVIOR, VOLUME I. FINAL REPORT,
Drexel Univ., Philadelphia, PA.
A. A. Fungaroli, and R. L. Steiner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-209 000, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-053a, July 1979. 330 p, 205 Fig, 33 Tab, 21 Ref, 1 Append. R800777 and R801947.

Descriptors: *Landfills, *Sanitary engineering, *Waste disposal, *Leachate, Infiltration, Soil chemistry, Percolation, Path of pollutants, Soil water, Subsurface drainage, Groundwater movement, Solid wastes, Gases, Wastes, Lysimeters.

A six year study of sanitary landfill behavior identified a semi-log linear relationship between contaminant concentration and leachate volume. An experimental sanitary landfill field site was monitored for gas generation, leachate migration, and groundwater contamination. The site was a 50 ft by 50 ft area with 11 ft of refuse covered by 2 ft of soil. Leachate quantity and pollution removal were recorded with a lysimeter in a laboratory sanitary landfill. At the field site accelerated column tests predicted long-term landfill behavior and identified the stabilization effects of depth and added nutrients. Various sizes of milled refuse were tested and the chemical components of leachates were correlated with each other and with leachate volume. Results were used to develop a two-dimensional model of leachate migration patterns. Good correlation was obtained from computer solutions and average field concentrations. Results show that once an entire landfill system is brought to field capacity the generation of leachate is in direct relationship to the volume of water added to the system. Leachate generation is dependent on initial moisture contents, landfill density, rate of filling, and water infiltration quantities. Leachate production is attributed to the refuse, channeling, an advance wetting front, or a main wetting front. Extensive conclusions are provided. (Seigler-IPA)

DISPOSAL OF DREDGED MATERIAL WITHIN THE NEW YORK DISTRICT: VOLUME I-PRESENT PRACTICES AND CANDIDATE ALTERNATIVES,
MITRE Corp., McLean, VA. METREK Div.
W. G. Conner, D. Aurand, M. Leslie, J. Slaughter, and A. Amr.
Performed for U.S. Army Corps of Engineers, New York District, May 1979. MITRE Technical Report MTR-7808. 360 p, 34 Fig, 59 Tab, 321 Ref, 5 Append. DACW51-C-77-0061.

Descriptors: *Dredging, *Waste disposal, *Management alternatives, *Ocean dumping, *Contaminants, *Disposal, *Dredged material, *New York, Land treatment, New York Bight, Chemical effects, Biological effects, Socioeconomic effects, Channels, Marine ecosystems, Federal Water Pollution Control Act Amendments, Borrow pits, Wetlands.

The two volumes of this report present results of a detailed evaluation of the dredged material ocean disposal program of the New York District of the U.S. Corps of Engineers. While there is clearly a need for continued dredging in the area, there are major environmental problems, mostly centered around the disposal of dredged material containing such contaminants as heavy metals, petroleum compounds, and synthetic organic compounds. Volume I examines the current program and its impacts in the New York Bight. Annual volumes of material dredged between 1970 and 1976 ranged from 8 to 19.5 million cubic yards. Area conditions which might signify environmental degradation include low water bottom oxygen content, declining commercial fish harvests, and increased incidence of fish diseases and kills. Continued dumping of dredged material and the current Mud Dump disposal site would probably directly affect only a relatively small area of the bottom. Alternatives were sorted into three categories: not currently reasonable, possible in special cases, and possible in special cases and feasible for larger volumes of dredged material. Three alternatives were placed in the third category and are most likely to provide acceptable disposal in the area: shallow ocean disposal, subaqueous borrow pits, and confined upland disposal. Open ocean disposal is recommended only as a last alternative. Measures to reduce the volume of dredged material include selective dredging and sediment control. (Arnold-NC)

THE KILLING OF RUSH CREEK,
Minnesota Department of Natural Resources, Rochester.
J. A. Schneider.
Water Spectrum, Vol 12, No 1, p 38-43, Winter 1979, 9 Fig.

Descriptors: *Fishkill, *Pesticide toxicity, *Minnesota, *Agricultural runoff, Surface runoff, Trout, Suckers, Turbidity, Water temperature, Dissolved oxygen, Ammonia, Water pollution effects, Erosion control, Wet seasons, Rainfall, Cholinesterase inhibition.

The May 20, 1978 fishkill along 13 miles of Rush Creek in Minnesota and other similar fishkills prompted a full scale investigation into the causes for the deaths. A common factor involved in all of the kills seemed to be rainfall heavy enough to cause washing and erosion from row crop fields. The most severe kills occurred during the May planting season every year. To pursue the theory that agricultural chemicals were causing the kills a staff of trained and experienced people from several agencies were assembled including the Extension Service, the Environmental Protection Agency, The Federal Fish and Wildlife Service, and the Minnesota Department of Natural Resources. A sampling program was designed that could be rapidly implemented the following year during May if the fishkills were repeated. Sampling procedures selected included: tests for pH, temperature, turbidity, ammonia, and dissolved oxygen; and a simple field test for detecting cholinesterase inhibition. Fishkills did occur in May and June and samples of moribund and freshly killed suckers were tested. The cholinesterase inhibition test gave excellent results indicating death due to poisoning probably from organo-phosphate-based insecticides for controlling corn rootworm larvae. Better farming practices to control erosion and runoff are needed to help prevent future kills. (Seigler-IPA)

D. T. Burton, P. R. Abell, and T. P. Capizzi.
Marine Pollution Bulletin, Vol 10, p 347-349, 1979. 1 Fig, 1 Tab, 19 Ref.

Descriptors: *Thermal stress, *Powerplants, *Fish physiology, Mortality, Water temperature, Juvenile growth stage, Regression analysis, Mathematical models, Cold resistance, Fish behavior, *Atlantic menhaden, *Acclimation.

This study was designed to assess the effects of various rates of thermal decrease on mortality of juvenile Atlantic menhaden (Brevoortia tyrannus) which may result from winter shutdown of large power plant facilities. Temperatures were lowered from 15 to 5C at rates of decrease which ranged from 27.0 to 0.4/hr. A significant correlation was found between rate of thermal decrease and mortality. The relationship between percent mortality and rate of decrease was best described by a piecewise regression curve with two rates; one rate where mortality was high and a second where mortality decreased rapidly as the rate of temperature reduction decreased. PHOSPHORUS RECYCLE AND CHLOROPHYLL IN THE GREAT LAKES,
Manhattan Coll., Bronx, NY. Environmental Engineering and Science Program.
D. M. Di Toro, and W. F. Matystik.
Journal of Great Lakes Research, Vol 5, No 3-4, p 233-245, 1979. 6 Fig, 2 Tab, 21 Ref.

Descriptors: *Great Lakes, *Lake Erie, *Lake Huron, *Lake Ontario, *Phosphorus, *Cycling nutrients, Eutrophication, Chlorophyll, Phytoplankton, Aquatic life, Algae, Kinetics, Limnology, Productivity, Water pollution effects.

A model of the kinetics of phosphorus recycling rates and their relationship to chlorophyll a concentrations and phytoplankton populations was developed for Lake Huron, Lake Ontario, Saginaw Bay, and other Great Lakes areas. To simply theoretically characterize, the recycling process nutrients are divided into three forms: plankton-bound, available, and unavailable. From these divisions a kinetic formulation for the recycling is developed. These formulations indicate a decline in the ratio of unavailable to total phosphorus with increasing chlorophyll a concentrations. This simple theoretical analysis with steady state and constant parameters is applied to long time average epilimnion data for areas in Lake Erie, Lake Huron, Lake Ontario, and Saginaw Bay. Results from this application suggest an inverse relationship between the unavailable portion of both total and soluble phosphorus and chlorophyll. Assumptions that the phosphorus recycling rate is a saturating function of chlorophyll produce consistent agreement with the same phytoplankton and recycle kinetic constants. Computations for Lake Huron illustrate that for the lower range of chlorophyll concentrations percentage increases in phosphorus discharge are larger than strictly proportional increases in chlorophyll. For Lake Huron a two-fold increase in phosphorus loading produces approximately a four-fold algal chlorophyll increase. (Seigler-IPA)
W80-03388

RESPONSES OF FRESHWATER BENTHOS TO OPEN-LAKE DREDGED SPOILS DISPOSAL IN LAKE ERIE,
Texas Univ. at Austin, Port Aransas. Marine Science Inst.
R. W. Flint.
Journal of Great Lakes Research, Vol 5, No 3-4, p 264-275, 1979. 5 Fig, 4 Tab, 21 Ref.

Descriptors: *Lake Erie, *Dredging, *Disposal, *Benthic fauna, Bottom sediments, Sands, Mud, Water sampling, Oligochaetes, Invertebrates, Benthos, Aquatic populations, Distribution patterns, Environmental effects, Worms, Larvae.

Temporal variations in the natural benthic macroinvertebrate community of areas subjected to open-lake dredged spoil disposal were examined in Lake Erie near Ashtabula. The two types of dredged spoil used were sandy-silt sediment from the Ashtabula harbor and coarser sand sediments from the Ashtabula River. Two untreated reference sites were also sampled for comparison. Ponar grab samples were used to characterize the communities at the sources of dredging to determine the types of material that would be deposited at the spoil sites. Samples were taken at the disposal and control sites at intervals of 5 days, 90 days, 256 days, and 340 days after disposal. For each sample taken a modified Spade box corer was used to collect four replicate bottom samples. Macroinvertebrates were identified to the lowest taxa possible. Results show that for the sandy silt site the density of macroinvertebrates increased while diversity decreased. Species brought in with the river and harbor sediments contributed to the increased density. Also while the untreated sites had communities of 60 to 80% oligochaetes both disposal sites had communities of 98% oligochaetes. The river spoils disposal sites showed a more rapid recovery to predisposal conditions. The opportunistic nature of the Oligochaeta life history patterns allows them to take advantage of and thrive in the environment existing after disposal. This dominance of Oligochaeta along with the increased population density form unstable communities at the disposal sites. (Seigler-IPA)

EVALUATION OF DREDGED MATERIAL POLLUTION POTENTIAL,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
J. M. Brannon.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A059 724, Price codes: A03 in paper copy, A01 in microfiche. Technical Report DS-78-6, August 1978. 39 p, 36 Ref.

Descriptors: *Aquatic environment, *Water pollution, *Dredging, *Wastes, Forecasting, Environmental effects, Water quality, Benthos, *Dredged material.

Synthesizes data from seven research projects that investigated pollution properties of dredged material and procedures for determining their potential for effect on water quality and aquatic organisms. Short-term impact of dredged material on water quality and aquatic organisms is related to the concentration of chemically mobile, readily available contaminants rather than total concentration. The Elutriate Test, which measures concentrations of contaminants released from dredged material, can be used to evaluate short-term impacts on water quality. The only constituents generally released from dredged material are manganese and ammonium -N. Elevated concentrations of these constituents, however, are of short duration because of rapid mixing and are of low frequency due to the intermittent nature of most disposal operations. Short-term chemical and biological impacts of dredging and disposal have generally been minimal. Longer term impacts of dredged material on

water quality have generally been slight and can be evaluated by means of the Elutriate Test and analysis of mobile forms of sediment contaminants. The greatest hazard of dredged material disposal is the potential effect of material on benthic organisms. Most dredged material has not proven particularly toxic. Some dredged material, however, can be extremely toxic or of unknown toxicological character. (WES)

EFFECTS OF ORGANIC COMPOUNDS ON AMPHIBIAN REPRODUCTION,
Kentucky Water Resources Research Inst., Lexington.
J. Birge, A. Black, and A. Kuehne.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-147523, Price codes: A03 in paper copy, A01 in microfiche. Research Report No 121, 1980. 45 p, 3 Fig, 5 Tab, 44 Ref. OWRT A-074-KY(2), 14-34-0001-7038.

Descriptors: Water quality, *Organic compounds, Phenols, *Amphibians, Reproduction, Toxicity, Lethal limit, *Water pollution effects, Embryo-Larval tests, Atrazine, Carbon Tetrachloride, Chloroform, Methylene chloride.

Aquatic toxicity tests were conducted with atrazine, carbon tetrachloride, chloroform, methylene chloride, trisodium nitrilotriacetic acid (NTA), and phenol. Each compound was administered to developmental stages of three to five amphibian species. Exposure was initiated at fertilization and maintained through 4 days post-hatching. Test responses included lethality and teratogenesis. Different amphibian species exhibited varying degrees of tolerance to the selected compounds. Greatest tolerance usually was observed for the more broadly adapted semi-aquatic and terrestrial species (e.g., Bufo americanus, Bufo fowleri). The more sensitive amphibians usually included those species which normally are restricted to aquatic or moist habitats (e.g., Rana catesbeiana, Rana pipiens). Median lethal concentrations (mg/l) determined at 4 days posthatching ranged from 0.41 to 48 for atrazine, 0.90 to 2.83 for carbon tetrachloride, 0.27 to 35.14 for chloroform, 17.78 to>32 for methylene chloride, 39.3 to 252.3 for NTA, and 0.04 to>0.89 for phenol. The most toxic compounds always included phenol, carbon tetrachloride, and atrazine, and the least toxic consistently were NTA and methylene chloride. For three chlorinated alkanes, including methylene chloride, chloroform, and carbon tetrachloride, toxicity increased with chlorination. Toxicity of the different compounds was further characterized by calculating concentrations which produced embryo-larval lethality or teratogenesis at frequencies of 10% and 1%. (Huffsey-Ky)

ALGAL AND INVERTEBRATE COMMUNITIES IN THREE SUBARCTIC LAKES RECEIVING MINE WASTES,
J. W. Moore, D. J. Sutherland, and V. A. Beaubien.
Water Research, Vol 13, No 12, p 1193-1202, 1979. 4 Fig, 4 Tab, 28 Ref.

Descriptors: *Lakes, *Water pollution, *Biological communities, *Canada, Mine wastes, Metals, Chemicals, Pollutants, Arsenic, Lead, Copper, Heavy metals, Hardness(Water), Phytoplankton, Zooplankton, Algae, Daphnia, Biota, Sampling, Chemical analysis, Subarctic, Limnology, Biology, Cyanide.

The effects of liquid mine wastes on the density, species composition, and diversity of phytoplankton and zooplankton were determined between May 1977 and May 1978 in a series of three small, shallow lakes (Meg, Keg, Peg Lakes) situated in the Canadian subarctic. The concentrations of the most common toxicants fluctuated widely during the study in each of the lakes. Meg Lake was the most polluted, with the concentrations of arsenic, lead, cyanide, and copper reaching 3.0, 0.65, 0.60, and 0.65 g/cu m, respectively. Although the levels of arsenic and lead in the other two lakes were roughly similar to those recorded in Meg Lake, cyanide and copper usually fell below detectable limits. Overall, changes in the level of contamination were poorly correlated with variations in the abundance of the flora and fauna. While phytoplankton (Chlamydomonas lapponica, Aphanotheece microspora) were common in Meg Lake, reaching densities of 200 mg/cu m, zooplankton were either rare or absent. Algal popu lations in Keg and Peg Lakes, which were dominated by Chlamydomonas lapponica and Oocystis parva, attained maximum densities of 200 and 150 mg/cu m, respectively. The most common zooplankter, Keratella quadrata, maintained populations of up to 20000-40000 animals/cu m, and was followed in abundance by Daphnia middendorfiana and Cyclops bicuspidatus thomasi. It was concluded that: (1) the prevalent species may have developed a resistance to metals; (2) taxa not previously associated with heavy metal contamination may have the ability to adapt to pollution; and (3) high arsenic and lead levels probably had less impact on zooplankton than on phytoplankton under field conditions. (Sims-ISWS)

THE EFFECT OF WASTEWATER PHOSPHORUS REMOVAL ON SHAGAWA LAKE, MINNESOTA: PHOSPHORUS SUPPLIES, LAKE PHOSPHORUS AND CHLOROPHYLL A,
Corvallis Environmental Research Lab., OR.
D. P. Larsen, J. Van Sickle, K. W. Malueg, and P. D. Smith.
Water Research, Vol 13, No 12, p 1259-1272, 1979. 8 Fig, 9 Tab, 48 Ref.

Descriptors: *Water pollution effects, *Lakes, *Phosphorus, *Chlorophyll, *Minnesota, Water pollution, Water pollution control, Sewage treatment, Water quality control, Algae, Nutrients, Pollutants, Pollutant identification, Phosphorus compounds, Sampling, Chemical analysis, Limnology, *Shagawa Lake(MN).

In early 1973, the phosphorus supply to Shagawa Lake, Minnesota, was reduced by about 80% when a tertiary wastewater treatment plant began operating. Significant reductions in total and soluble reactive phosphorus concentrations have occurred in the lake since that time. By 1976 the average (volume weighted over the entire lake) total and soluble reactive phosphorus concentrations had declined from about 51 and 21 micrograms/liter to about 30 and 4.5 micrograms/liter, respectively, corresponding to 40 and 80% reductions. During 1975 and 1976, chlorophyll a (averaged over the top 5 m) had decreased to less than 50% of the pretreatment level during May-June, but during July-August little change had occurred. A phosphorus residence time model projected equilibrium total phosphorus concentrations of about 12 micrograms/liter within 1.5 years. The fact that this level was not reached was attributed to a feedback of phosphorus from the sediments, primarily during summer. This phenomenon was incorporated into a modified total phosphorus mass balance model which projects the phosphorus pattern through 1976 quite accurately. The close fit of the modified mass balance model implies that the phosphorus supply from the sediments has not diminished since treatment began, and that further recovery of the lake will depend upon how long this feedback of phosphorus from the sediments continues. (Sims-ISWS)
W80-03459

EFFECTS OF LIMESTONE STRIP MINING ON BENTHIC MACROINVERTEBRATE COMMUNITIES,
Calgary Univ. (Alberta). Dept. of Biology.
L. L. Osborne, R. W. Davies, and K. J. Linton.
Water Research, Vol 13, No 12, p 1285-1290, 1979. 1 Fig, 4 Tab, 23 Ref, 1 Append.

Descriptors: *Strip mines, *Limestones, *Water pollution effects, *Invertebrates, *Pennsylvania, Mine wastes, Mine acids, Alkalinity, Hydrogen ion concentration, Biota, Biological communities, Rivers, Sampling, Pollutants, Iron compounds, Water chemistry, Larvae, Biology, Buffering.

The changes in water quality and benthic macroinvertebrate community structure and composition related to limestone strip mining in western Pennsylvania were recorded and compared to the recorded effects of coal strip mining. In contrast to coal strip mining characterized by high total acidity and iron concentrations with decreased total alkalinity and pH, limestone strip mining showed only a slight increase in total acidity and bicarbonate alkalinity, and no increase in iron concentration due to the formation of heavy deposits of ferric hydroxide. The sulfate concentration and conductance increased with both coal and limestone strip mining. Limestone strip mining did not result in the extreme deterioration of benthic community structure and composition reported with coal strip mining. The decreased species diversity recorded was directly correlated with the sulfate concentrations and resulted from changes in species abundance rather than species composition. The changes in species abundance appear to be related to changes in food resource availability due to the deposition of ferric hydroxide on the detritus. (Sims-ISWS)

DISTRIBUTION, ABUNDANCE, AND PETROLEUM-DEGRADING POTENTIAL OF MARINE BACTERIA FROM MIDDLE ATLANTIC CONTINENTAL SHELF WATERS,
Virginia Inst. of Marine Science, Gloucester Point. Dept. of Microbiology-Pathology.
A. E. Maccubbin, and H. Kator.
In: Proceedings of the Workshop: Microbial Degradation of Pollutants in Marine Environments, Pensacola Beach, Florida, 9-14 April 1978, U.S. Environmental Protection Agency, Miscellaneous Reports Series, No EPA-600/9-79-012, p 380-395, April 1979. 6 Fig, 8 Tab, 15 Ref.

Descriptors: *Bacteria, *Organic compounds, *Oil pollution, *Microbial degradation, *Water pollution effects, Environmental effects, Seasonal, Baseline studies, Resources development, Oil spills, *Outer Continental Shelf, Middle Atlantic, Crude oil.

Bacterial populations indigenous to surface (1 m) waters of the Middle Atlantic Continental Shelf were sampled at seasonal intervals to determine the abundance and distribution of petroleum-degrading (HC), chitinoclastic, and 'total' heterotrophic (HET) bacteria. Simultaneously, unweathered South Louisiana crude oil was added to aliquots of 1-m water samples to evaluate rates and patterns of saturated paraffin degradation on shipboard under controlled incubation conditions. Degradation was examined under selected nutrient and temperature regimes in both closed flasks and prototype 'open' or continuous dilution systems. HET bacterial

levels generally decreased with distance from land. HC bacteria were most abundant in the coastal boundary layer. Changes in values of HC/HET tended to be directly related to the abundance of petroleum-degrading bacteria. Degradation of saturated paraffins in closed flasks characteristically resulted in removal of n-alkanes and isoprenoids at rates related to season, sampling location, and nutrient regime. EFFECTS OF SUBLETHAL OIL CONCENTRATIONS ON THE COPEPOD, NITOCRA AFFINIS,
North Carolina State Univ. at Raleigh.
J. F. Ustach.
Estuaries, Vol 2, No 4, p 273-276, December 1979. 1 Tab, 30 Ref.

Descriptors: *Oil pollution, *Copepods, *Water pollution effects, Oil spills, Environmental effects, Resources development, Baseline studies, *Outer Continental Shelf, Nitocra affinis, Crude oil, Sublethal effects.

The water soluble fraction from 200 micro 1 Louisiana crude oil per liter of filtered sea water and of the one-half and three-quarter dilutions of the oiled water with filtered sea water caused a reduction in brood size of the harpacticoid copepod, Nitocra affinis. The mean (or - standard error) brood size of the control was 14.41 or - 1.09 while those of the animals exposed to the undiluted, one-half, and three-quarter dilutions were 8.37 or - 1.78, 8.44 or - 1.25, and 8.35 or - 1.63, respectively. There were no statistically significant differences among the mean lengths of life spans or among the mean frequencies of broods produced. (Sinha-OEIS)

ENZYME ACTIVITIES FOLLOWING CHRONIC EXPOSURE TO CRUDE OIL IN A SIMULATED ECOSYSTEM. I: AMERICAN OYSTERS AND BROWN SHRIMP,
Mississippi State Univ., Mississippi State.
J. E. Chambers, J. R. Heitz, F. M. McCorkle, and J. D. Yarbrough.
Environmental Research, Vol 20, No 1, p 133-139, October 1979. 6 Tab, 10 Ref.

Descriptors: *Oil pollution, *Ecosystems, *Oysters, *Shrimp, *Enzymes, Oil spills, Resources development, Water pollution effects, Environmental effects, Baseline studies, Seasonal, *Outer Continental Shelf, Crassostrea virginica, Penaeus sp.

Enzyme activities were investigated in whole-body homogenates from oysters and hepatopancreas homogenates from shrimp which had been exposed to crude oil for 8 months in a simulated estuarine ecosystem. Enzymes assayed included acetylcholinesterase, alkaline phosphatase, Beta-glucuronidase, glutamic-pyruvic transaminase, lactic dehydrogenase, and malic dehydrogenase. Few seasonal trends in enzyme activity were observed in either species. Several alterations in enzyme activity were noted in oil-treated shrimp and oysters 6-8 months following the oil spill when the animals were stressed and may reflect physiological changes in animals which are severely stressed. However, few chronic alterations in enzyme activity were observed which could be attributed to the oil spill. (See also W80-03542) (Sinha-OEIS)

ENZYME ACTIVITIES FOLLOWING CHRONIC EXPOSURE TO CRUDE OIL IN A SIMULATED ECOSYSTEM. II: STRIPED MULLET,
Mississippi State Univ., Mississippi State.
J. E. Chambers, J. R. Heitz, F. M. McCorkle, and J. D. Yarbrough.
Environmental Research, Vol 20, No 1, p 140-147, October 1979. 5 Tab, 6 Ref.

Descriptors: *Enzymes, *Fish, *Oil pollution, *Water pollution effects, Estuaries, Ecosystems, Oil spills, Resources development, Baseline studies, Environmental effects, Seasonal, Gulf of Mexico, *Outer Continental Shelf, Mugil cephalus.

Enzyme activities were investigated in brain, gill, liver, and muscle homogenates from striped mullet which had been exposed to crude oil for 10 months in a simulated estuarine ecosystem. Enzymes assayed included acetylcholinesterase, alkaline phosphatase, Beta-glucuronidase, glutamic-pyruvic transaminase, lactic dehydrogenase, and malic dehydrogenase. Few seasonal trends in enzyme activities were observed. Alterations in some enzyme activities, particularly acetylcholinesterase, Beta-glucuronidase, and malic dehydrogenase, may have reflected physiological changes in the mullet resulting from stress. In general, there were few chronic alterations in mullet enzyme activities resulting from the oil spill. (See also W80-03541) (Sinha-OEIS)

5D. Waste Treatment Processes

PROCESS FOR SOLUBLE CYANIDE REMOVAL FROM WASTEWATER STREAMS,
Ciba-Geigy Corp., Ardsley, NY. (Assignee).
Y. S. Sury, and M. J. Guillory, Jr.
US Patent No 4,176,060, 4 p, 3 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1050, November 27, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, Chlorination, Acidity, Temperature, Chemical reactions, Cyanide.

The object of this invention is to provide a process for substantially destroying the soluble cyanide complex content of industrial wastewater streams. By conducting a hot acid chlorination technique, the soluble cyanide complex content of industrial wastewater streams can be reduced to a level below about 1 ppm. Thus, by contacting the wastewater at a temperature in excess of about 80C, and preferably in excess of about 95C, with sufficient mineral acid such as hydrochloric, sulfuric, nitric, phosphoric, and the like to provide a pH level below about 3.0 and with additional chlorine, rapid, efficient, complete reduction of the soluble cyanide complex is achieved. (Sinha-OEIS)
W80-03362

A STUDY OF THE APPLICABILITY OF BATCH REACTOR WASHWATER TREATMENT FOR AREAS OF INTERMITTENT LOADING,
Maryland Univ., College Park. Dept. of Civil Engineering.
J. E. Alleman, and J. S. Colt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-147507, Price codes: A04 in paper copy, A01 in microfiche. University of Maryland Water Resources Research Center Technical Report No 55, Nov 1979. 68 p, 36 Fig, 2 Tab, 10 Ref. OWRT A-049-MD (1), 14-34-0001-9022.

Descriptors: *Sewage treatment, *Waste water treatment, *Batch waste water treatment, Aeration, Septic tanks, Waste treatment, Water treatment, Parks, Recreation facilities, Oxidation lagoons, On-site investigations, Discharge(Water), Influent streams, Inflow, Infiltration.

Seven waste water treatment facilities at Maryland state parks were examined and evaluated on the basis of system design, influent characteristics, and overall performance. Five of the plants are extended-areation systems; one is a septic tank/filtration gallery; one is an oxidation pond with subsequent sand filtration. Unit capabilities ranged from 50,000-250,000 gallons per day; influent flows varied considerably in rate and strength. Influent depended primarily on plant location, park usage, and season of the year. All plants were operated twelve months of the year and plant discharge during the winter was comprised of inflow and infiltration, and/or clean water used with chlorine injector units. Plants were shown to be vastly overdesigned, and hence there was an inadequacy of sufficient waste water organics necessary to maintain a desirable activated-sludge population. Dog food is added to several plants' influent stream to augment the lack of waste water organics. Batch treatment is recommended and two batch systems are proposed. Back-up low-flow systems are proposed for slow seasons. Connection of adjacent housing developments to existing park facilities is suggested. Consideration should be given to the renovation of plants, and their operation as intermittent discharge systems. (Schaefer-IPA)

METHOD AND APPARATUS FOR RECOVERING LIQUID AND SOLID CONSTITUENTS OF WATER SOLUTIONS CONTAINING SPARINGLY SOLUBLE SOLIDS,
Environmental Systems, Inc., El Paso, TX. (Assignee).
R. T. Wheatley, and L. J. Kosarek.
US Patent No 4,176,057, 10 p, 4 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1048, November 27, 1979.

Descriptors: *Patents, *Waste water treatment, *Water purification, Industrial wastes, Separation techniques, Reverse osmosis, Chemical reactions, Suspended solids, Powerplants, Industrial plants, Product recovery, Closed loop system.

This invention relates to a method and apparatus for separating aqueous solutions containing sparingly soluble solids into useable constituents including the purifying of waste waters from industrial and power plants so that the plants may operate with a capability of a zero polluted effluent discharge and yet require only the disposal of a very small volume of sludge which in many instances may have a by-product value. Specifically, the invention provides a closed loop system for the recovery of water and solids from hydrometallurgical solutions, effluent of industrial and power plants and the like while the closed loop system only requires a low input of energy, utilizes reverse osmosis technology, chemically treats the brine effluent to reduce soluble constitutents to prevent fouling of the reverse osmosis membrane, reintroduced the water content of the brine effluent back into the system for zero or minimal discharge of effluent and yields small easily handled volumes of substantially solid sludge which may have sufficient fertilizer or recoverable metal value to warrant processing. (Sinha-OEIS)
W80-03414

WATER PURIFICATION METHOD AND APPARATUS,
Westinghouse Electric Corp., Pittsburgh, PA. (Assignee).
K. Moeglich.
US Patent No 4,176,038, 12 p, 14 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1043, November 27, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Electrolysis, Turbulence, Electrodes, Alternating current, Coagulation, Scaling, Equipment, Separation techniques, Fluidized bed.

An improved method and apparatus for continuously agglomerating solids of colloidal size or larger suspended in a liquid is disclosed. The process comprises passing the liquid between spaced electrode plates in the presence of a fluidized bed of conductive particles, and subjecting the liquid suspension to an electric field from alternating

current applied across the electrodes through the conductive particles. The turbulence of the particles in the bed has been found to improve conductivity and current efficiency, minimize electrode erosion, and by a mechanical, scrubbing action of the bed particles, minimize fouling or scaling of the electrodes so that the suspending forces of the solids are rapidly and efficiently broken. The agglomerated solids may then be separated from the liquid by conventional means such as skimming, settling, flotation and the like. (Sinha-OEIS)
W80-03426

HYDROLOGIC DATA FROM A DEEP TEST WELL, CITY OF SARASOTA, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
H. Sutcliffe, Jr.
Available from OFSS U.S. Geological Survey, Box 25425, Federal Center, Denver, CO 80225, Price codes: $3.50 in paper copy, $3.50 in microfiche. Geological Survey open-file report 79-1275, 1979. 23 p, 2 Fig, 5 Tab, 2 Ref.

Descriptors: *Hydrologic data, *Injection wells, *Rotary drilling, *Waste disposal, *Liquid wastes, Test wells, Treatment facilities, Water analysis, Sampling, Chlorides, Aquifer characteristics, Water quality, Petrology, Chemical analysis, Trace elements, Florida, *Sarasota(Fla), Conventional circulation mud-rotary drilling method, Reverse circulation air-lift drilling method.

The city of Sarasota drilled a test well to a depth of 3,513 feet at the city's wastewater-treatment facility in downtown Sarasota, Fla. The test well was drilled to determine the feasibility of disposing of liquid waste from the city's secondary treatment plant. Drilling of the test well began in July 1973 and was completed in November 1974. A conventional circulation mud-rotary drilling method was used to a depth of 1,146 feet below land surface and a reverse circulation air-lift method was used to a depth of 3,513 feet. The greatest chloride concentration of water withdrawn from the test well was 31,000 milligrams per liter. The test well, uncased and open to dolomitic limestone between 2,006 and 3,513 feet, yielded 392 gallons per minute with a drawdown of approximately 100 feet. (Kosco-USGS)
W80-03482

PURIFICATION OF WASTE STREAMS CONTAINING AVAILABLE CHLORINE,
Olin Corp. New Haven, CT. (Assignee).
W. J. Sakowski.
U.S. Patent No 4,175,038, 4 p, 5 Ref; Official Gazette of the United States Patent Office, Vol 988, No 3, p 699, November 20, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Chemical wastes, Chlorine, Chemical reactions, Chlorination, Temperature, Activated carbon.

A process is disclosed for reducing the available chlorine content of aqueous waste streams produced in chemical plants, especially calcium hypochlorite plants, in order to permit further purification treatment in waste purification systems which employ activated carbon. The available chlorine content is reduced by chlorinating the impure stream at a temperature in the range from about 80 to 100C at a pH in the range from about 5.5 to about 8.5. In order to avoid excessive reactor boilover, close control of these conditions is required. In addition the reaction is time dependent and the holup time in the reactor and a subsequent hold tank ranges from about 0.5 to about 4 hours. During this reaction the available chlorine forms the corresponding chlorate in the aqueous solution which may be passed through the activated carbon bed without adversely affecting the bed operation. (Sinha-OEIS)
W80-03539

OXIDATION PROCESS,
Sterling Drug Inc., New York. (Assignee).
L. A. Pradt, and W. B. Gitchel.
U.S. Patent No 4,174,280, 4 p, 2 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 988, No 2, p 435, November 13, 1979.

Descriptors: *Patents, *Waste water treatment, *Waste treatment, Industrial wastes, Oil pollution, Oxidation, Heat exchangers, Recycling, Explosives, Wet oxidation process, Product recovery, Petroleum products.

The invention comprises a process for oxidizing by wet air oxidation an oxidizable material which is insoluble, immiscible and difficult to suspend or emulsify in water. The process comprises injecting the material directly into a sealed reactor containing an aqueous medium supplied with an oxygen-containing gas, oxidizing the material at a temperature and pressure sufficient to provide controlled autogenic and self-sustaining reaction, to produce an oxidized effluent which is removed from the reactor. Materials especially adapted to oxidation by this process are petroleum products, motor oils, diesel fuel, explosives, and propellants. The invention can be employed in connection with any known application of wet air oxidation systems, including those designed for waste disposal, for byproduct or chemical recovery or for generation of useful energy. (Sinha-OEIS)
W80-03591

SLUDGE THICKENING APPARATUS AND PROCESS,
Envirotech Corp., Menlo Park, CA. (Assignee).
E. M. Kelly.
U.S. Patent No 4,173,534, 8 p, 3 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 988, No 1, p 176-177, November 6, 1979.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Sludge treatment, Industrial wastes, Domestic wastes, Activated sludge, Anaerobic digestion, Equipment, Sludge thickening.

A wastewater treatment system of the activated sludge type includes a primary clarifier, a biological treatment unit and a secondary clarifier. The object of the invention is to provide means for concomitantly thickening primary and secondary sludge. In addition improved means are provided for inhibiting anaerobic decomposition of the primary sludge while it is being thickened. The apparatus comprises a tank having upper and lower feedwells. Primary sludge is introduced into the lower feedwell and flows into the lower part of the tank to thicken. Secondary sludge is aerated and introduced into the upper feedwell so that it flows from and thickens in the upper part of the tank by flotation type thickening. (Sinha-OEIS)
W80-03596

5E. Ultimate Disposal Of Wastes

PROCESSES AFFECTING THE FATE OF DREDGED MATERIAL,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
B. W. Holliday.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A059 276, Price codes: A03 in paper copy, A01 in microfiche. Technical Report DS-78-2, August 1978. 32 p, 36 Ref.

Descriptors: *Environmental effects, *Waste disposal, Oceans, Estuaries, Rivers, Lakes, *Dredged material, *Dredged material disposal.

Determination of the fate of dredged material placed on the bottom of an ocean, lake, estuary, or river is an environmental concern that requires consideration and adequate prediction in the planning of a dredging project, since various natural processes can alter the initial configuration of the deposit and subject the surrounding bottom to some level of environmental impact. In the selection process for a disposal site, consideration must be given to the eventual disposition of dredged material in order that adequate determination of the site capacity can be made. The four primary environments that may contain subaqueous dredged material deposits are oceans, estuaries, rivers, and lakes, with various energy-related zones within each environmental system. Each zone has a unique set of physical factors and sedimentological properties that will determine the potential fate of a dredged material deposit. Prediction of the fate of dredged material at a disposal site requires knowledge of: (1) currents, (2) waves, (3)tide, (4) suspended sediment concentrations, (5) seasonal energy fluctuations, (6) storms, (7) dredging/disposal operations, (8) shipping traffic, (9) fisheries activities, (10) bathymetry, (11) sedimentology, and (12) biological activity. (WES)
W80-03396

CONFINED DISPOSAL AREA EFFLUENT AND LEACHATE CONTROL (LABORATORY AND FIELD INVESTIGATIONS),
University of Southern California, Los Angeles. and Army Engineer Waterways Experiment Station, Vicksburg, MS.
K. Y. Chen, J. L. Mang, B. Eichenberger, and R. E. Hoeppel.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A062 882, U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report DS-78-7, October 1978. 94 p, 5 Fig, 12 Tab, 9 Ref.

Descriptors: *Effluents, *Leachates, *Waste disposal, Groundwater, Water pollution control, Dredging, Chemical analysis, Influents, *Dredged material, *Containment areas.

Summarizes findings of five work units concerned with impact of dredged material disposal in confined land disposal areas. Three work units dealt with active disposal operations at 11 sites; impact was assessed by comparing the quality of influents and effluents at each site with background surface receiving water. Two work units evaluated impact of confined disposal area leachates on groundwaters. Leachate studies included laboratory column elutions (3- to 9-month period) of each of five types of dredged material overlying one of two different soils; four field sites were also monitored for changes in leachate and groundwater quality in a 9-month study. Field sites included fresh and brackish water dredging environments in geographical areas where contamination problems were anticipated. Dredged material and environmental features varied greatly at different sites. In most cases soluble concentrations of most chemical constituents were very low. Only soluble manganese and ammonia nitrogen levels failed to meet most criteria. Leachate studies suggest the disposal of brackish water dredged material in upland disposal areas may render subsurface water unsuitable for public water supply or irrigation purposes. Guidelines for evaluation of potential disposal sites should be developed in steps not requiring complete execution of total program to determine site suitability. (WES)

Available from the National Technical Information Service, Springfield, VA 22161 as AD-A062 867, Technical Report D-78-26, July 1978. 1498 p, 48 Fig, 59 Tab, 121 Ref, 9 Append.

Descriptors: Marsh plants, *Vegetation establishment, Waste disposal, Habitats, Dredging, Georgia, *Dredged material, *Habitat development, *Atlantic Intracoastal Waterway, *Buttermilk Sound(Georgia).

A field study to test the feasibility and impact of developing a marsh on dredged material was initiated in 1975 at Buttermilk Sound near the mouth of the Atlamaha River, Glynn County, Georgia. The 2-ha island is in the Atlantic Intracoastal Waterway and is an area of dredged material disposal for maintenance dredging of the waterway. This

report presents the results of habitat development activities between spring 1975 and fall 1977 and is Appendix A to the Buttermilk Sound marsh development site summary report. The site was graded to a 3.7 percent slope and partitioned into three elevation zones which were subjected to tidal inundation less than 6 hours each day, 6 to 18 hours each day, and more than 18 hours each day, respectively. Each zone was treated with a combination of experimental plantings including seven marsh plant species, two forms of propagule, and five patterns of fertilizer application. The plants were monitored for their response to fertilizer and inundation levels. Within the plots, interstitial water chemistry, soil chemistry, soil microbiology, and invading plant species were monitored. Aquatic biota and wildlife observations were made. (WES)

HABITAT DEVELOPMENT FIELD INVESTIGATIONS, WINDMILL POINT MARSH DEVELOPMENT SITE, JAMES RIVER, VIRGINIA: APPENDIX F: ENVIRONMENTAL IMPACTS OF MARSH DEVELOPMENT WITH DREDGED MATERIAL: SEDIMENT AND WATER QUALITY,
Wright State Univ., Dayton, OH.; and Old Dominion Univ., Norfolk, VA.
D. D. Adams, D. A. Darby, and R. J. Young.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A061 917, Price codes: A05 in paper copy, A01 in microfiche. US Army Engineer Waterways Experiment Station, Vicksburg, MS. Tech Rept D-77-23, Aug 78. Vol I: Characteristics of Channel Sediments Before Dredging and Effluent Quality During and Shortly After Marsh Habitat Development. 79 p, 6 Fig, 25 Tab, 70 Ref.

Descriptors: *Environmental effects, *Connate water, *Habitats, Sediments, *Dredging, Marshes, Water quality, Virginia, *Habitat development, Dredged material, Waste disposal sites, *Windmill Point(VA), James River(VA).

First of a two-volume appendix presenting the results of chemical and sedimentological studies conducted at a dredged material marsh development site located near Windmill Point, on the tidal freshwater James River, 16 km below Hopewell, Virginia. Navigation channel sediments were collected in January 1975, before dredging and marsh development, and described according to their temperature, pH, oxidation reduction potential, percent water, percent volatile solids, particle size composition, mineralogy, and cation exchange capacity. Sediment interstitial water and total sediment concentrations of sulfides and various nutrients and metals were also documented. The relationships between channel sediment characteristics and the chemical quality of effluent leaving the diked marsh development site were studied under three different conditions: (1) in January, 1975--during actual dredging and dredged material disposal for marsh substrate development, (2) during dewatering (2-4 days after the completion of dredged material disposal operations), and (3) in May 1975--3.5 months after dredging, before the marsh vegetation planting operations had begun or any extensive natural vegetation development had occurred. During dredging, about two-thirds of the channel sediments' organic material was lost, probably by flotation or as organic surface scums. Average concentration of suspended solids leaving the dike during dredging was 16 percent. (WES)

HABITAT DEVELOPMENT FIELD INVESTIGATIONS, WINDMILL POINT MARSH DEVELOPMENT SITE, JAMES RIVER, VIRGINIA, APPENDIX E: ENVIRONMENTAL IMPACTS OF MARSH DEVELOPMENT WITH DREDGED MATERIAL: METALS AND CHLORINATED HYDROCARBON COMPOUNDS IN MARSH SOILS AND VASCULAR PLANT TISSUES,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
J. D. Lunz.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A062 170, Price codes: A04 in paper copy, A01 in microfiche. Technical Report D-77-23, August 1978. 88 p, 18 Fig, 10 Tab, 38 Ref.

Descriptors: *Environmental effects, *Dredging, *Marshes, *Chlorinated hydrocarbon pesticides, *Metals, Dredged material, *Habitat development, Vascular plants, Virginia, *Windmill Point(VA), James River(VA).

Soil and vascular plant tissue samples were collected in October 1976 from three freshwater marshes located on the James River in Virginia. One marsh had been constructed using dredged material during 1974-75 maintenance dredging of the James River navigation channel. The other marshes were natural. The marshes studied had similar substrate characteristics. All were fine-textured silt and clay with volatile solids values between 10 and 20 percent, and contained about 50 percent water. Elevation and plant community characteristics were similar. Soil and plant tissue samples were analyzed for the metals nickel, zinc, chromium, lead, and cadmium and the chlorinated hydrocarbon compounds DDT, DDD, DDE, lindane, heptachlor, heptachlor epoxide, chlordane, endrine, dieldrin, Kelthane, Kepone, PCBs, and toxaphene. Marsh soil concentrations of chromium, cadmium, and lead were higher in the dredged material marsh; nickel and zinc concentrations were higher in the natural marsh. Low detectable levels of DDD, chlordane isomers, and Arochlor 1260 (PCB) occurred most frequently in dredged material marsh soils. Nickel was the only metal identified in experimental marsh plant tissue at higher levels than in similar tissue from a natural marsh. Potential soil chemical to plant transfer routes including surface sorption and adsorption and translocation were evidenced and discussed. (WES)

HABITAT DEVELOPMENT FIELD INVESTIGATIONS, BOLIVAR PENINSULA, MARSH AND UPLAND HABITAT DEVELOPMENT SITE, GALVESTON BAY, TEXAS; SUMMARY REPORT,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
H. H. Allen, E. J. Clairain, R. J. Diaz, A. W. Ford, and L. J. Hunt.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A066 224, Price codes: A07 in paper copy, A01 in microfiche. Technical Report D-78-15, August 1978. 73 p, 5 Tab, 36 Ref, 3 Append.

Descriptors: *Habitats, *Marshes, *Environmental effects, *Dredging, Vegetation, Vegetation establishment, Texas, *Dredged material, *Galveston Bay(TX).

A 2-1/2-year field investigation was conducted at Bolivar Peninsula, Galveston Bay, Texas, to test the feasibility and impact of developing marsh and upland habitats on dredged material. Baseline information derived before habitat development operations and results of postdevelopment operations are summarized. Two marsh grass species and nine upland plant species including trees, shrubs, and grasses were planted in test plots on a dredged material site lying between the Gulf Intracoastal Waterway and Galveston Bay. Tests were conducted to measure plant survival and performance in response to different fertilizer treatments and planting methods. Plantings of marsh grasses were made within an intertidal area protected from wave energies by sandbag dike. Prior to and during plant development, information was collected to document changes in fish and wildlife communities. Plantings were successful in both marsh and upland. Components of the habitat development site, consisting of planted vegetation and sandbag dike, attracted insects, aquatic organisms, and birds. After less than a year of development, the site provided heterogeneous habitats which tended to support greater use by fish and benthos than generally associated with sandy shores along Bolivar Peninsula. The study indicated habitat development is a feasible dredged material disposal alternative. (WES)

EPA'S HAZARDOUS-WASTE PROGRAM: WILL IT SAVE OUR GROUND WATER,
G. Dallaire.
Civil Engineering, Vol 48, No 12, p 39-45, December, 1978. 4 Fig.

Descriptors: *Hazards, *Waste disposal, *Ground water, Regulations, Water pollution control, Landfills, Lagoons, Aquifers.

Case histories of ground water contamination by hazardous wastes are presented as examples of what the EPA hopes to prevent by imposing strict regulations on generators, transporters, storers, processors, and disposers of hazardous wastes. Once an aquifer is polluted it tends to remain polluted. The EPA's strategy is to keep hazardous materials out of aquifers by keeping track of them and ensuring that the final disposal site is insulated from the ground water. Landfills, lagoons and injection wells are the only means of disposal in many areas due to previous regulations barring incineration and surface water disposal. Weaknesses in the new EPA regulations include: ambiguity in defining hazardous wastes, overdesigning of waste disposal facilities, high retrofitting costs of landfills and lagoons, continuing contamination from abandoned landfills and lagoons, and lack of assurance that waste generators will comply with the regulations. TERMINAL ISLAND SEWAGE TREATMENT PLANT OUTFALL, LOS ANGELES HARBOR, CALIFORNIA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
W. H. McAnally, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A063 247, Price codes: A03 in paper copy, A01 in microfiche. Technical Report H-78-23, December 1978. 31 p, 2 Tab.

Descriptors: *Sewage treatment, *Outfall sewers, *Treatment facilities, *Hydraulic models, California, *Los Angeles Harbor(Calif), *Long Beach Harbor(Calif), *Terminal Island(Calif).

Proposed relocations of the Terminal Island Treatment Plant outfall in Los Angeles Harbor were tested in a physical hydraulic model of Los Angeles and Long Beach Harbors, California. The model reproduced proposed plans of harbor modifications that included dredging and landfill in Los Angeles Harbor and dredging and construction of an oil loading pier in Long Beach Harbor. Five potential locations of the outfall were tested for conditions of a mean tidal range, a modeled effluent representing a prototype effluent of 10 ppt and 76F discharging into receiving water of 34 ppt and 60F. Model effluent was dyed red and photographed as it moved through the harbors. Outfall locations along the face of the proposed Los Angeles phase I landfill produced a plume that generally followed an eastward curving path toward the breakwater, passing out through Angel's Gate with ebb phase flows. During flood phase flows some dye moved back northward toward the outfall location. One location, near the western edge of the proposed landfill, showed an instability in direction of plume travel, moving westward at times. Tests of two locations were performed with a possible phase II landfill installed in the model. (WES)

ALUMINA-LIME-SODA PILOT PLANT TESTING AT THE U.S. BUREAU OF RECLAMATION DESALTING TEST STATION AT YUMA, ARIZONA,
Midwest Research Inst. Kansas City, MO.
A. D. Tippit, and J. W. Nebgen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-143688, Price codes: A05 in paper copy, A01 in microfiche. Final Report Prepared for Office of Water Research and Technology, 1979. 76 p, 10 Fig, 36 Tab, 3 Append, 14-34-0001-9509.

Descriptors: *Silica, *Desalination processes, *Aluminum, *Lime, *Water treatment, Arizona, Reverse osmosis, Waste water treatment, Brines, Saline water, Brackish water, Pilot plants, Colorado River, Irrigation water, Cost analysis, Alumina-lime-soda process.

As a part of research being done at the Bureau of Reclamation's Yuma desalting plant, alumina-lime-soda, a specific process for silica removal from saline water in the pH range 8.5 to 9.0, was tested at Yuma, Arizona, in a 10,000 GPD pilot plant. Two types of water were used for the testing, one was chlorinated degritted Wellton-Mohawk Canal water which is brackish water pumped from irrigation fields to prevent salt buildup and the other was waste brine generated by several small reverse osmosis units. A flow diagram for the alumina-lime-soda treatment process is given along with start-up and shut-down procedures. The process involves treating water with sodium aluminate to provide alumina for removal of soluble constituents in raw water. The lime is used to maintain pH conditions for the reactions taking place. Test runs were performed by operating the plant for several days at a predetermined pH condition. Influent and effluent samples were composited hourly and daily and were analyzed for calcium, magnesium, sodium, chloride, sulfate, alkalinity, and silica. Results show that silica in the canal water can be reduced from 40mg/liter to 10mg/liter and the brine can be reduced from 60 to 70mg/liter to 10mg/liter. Cost analyses show canal water treatment to be $0.48/1000 gal at a pH of 8.5 and brine treatment to be $0.43/1000 gal at a pH of 8.5. For reverse osmosis desalination the maximum silica reduction occurs at the same point as minimum chemical cost. (Seigler-IPA)
W80-03307

WATER PURIFIER SYSTEM AND VALVE,
T. V. Tyler.
U.S. Patent No 4,176,063, 17 p, 9 Fig, 19 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1051, November 27, 1979.

Descriptors: *Patents, *Water purification, *Water treatment, Reverse osmosis, Membrane processes, Domestic water, Valves, Equipment, Water conservation.

An economical and commercially practical reverse-osmosis water purifier system has no back pressure acting against the semipermeable membrane, so that the filtering rate is maximized. Furthermore, the supply of tap water to the system is shut off automatically as soon as the pure water storage tank is full; use of water is greatly reduced. A single tube extends to the spigot from the pure water storage tank and contains a check valve which maintains pressure at the spigot when such storage tank is depressurized for maximized filtering speed. When the spigot is opened, the drop in water pressure in the tube opens a valve which passes squeeze water to the depressurized tank, whereupon it pressurizes to force pure water out the spigot. When the storage tank is full of pure water, a valve is closed automatically, thus preventing further flow of water to the drain so that water use is reduced. The opening of the spigot operates a pressure-responsive pilot valve which in turn opens a squeeze-control valve. These valves, and also the check valve, and the valve which shuts down water flow when the storage tank is full of pure water, are economical, sensitive and rugged diaphragm valves. (Sinha-OEIS)

THE PLACING OF THE DISINFECTION STAGE IN A RECLAMATION PLANT TO REDUCE HALOFORM FORMATION,
Water Research Commission, Pretoria (South Africa).
O. O. Hart.
Water SA, Vol 5, No 4, p 178-188, October 1979. Presented at Symposium on 'Disinfection of Water', Pretoria, November 16, 1978. 12 Fig, 2 Tab, 45 Ref.

Descriptors: *Chlorination, *Halogens, *Ozone, *Disinfection, *Water treatment, Chemical analysis, Gas chromatography, Adsorption, Bromides, Activated carbon, Public health, South Africa, Water sampling, Reclamation, Potable water.

Four chlorination process configurations were investigated at the Stander Water Reclamation Plant in Pretoria, South Africa, to identify the process that would produce the least concentration of volatile halogenated hydrocarbons (VHH). Chlorination of water supplies may produce halogenated compounds that could be carcinogenic. A flowchart is presented for the four process configurations. For each process tested 24 hour representative samples were collected after the 8th day of process operation. A Hewlett Packard 5710A gas chromatograph with an auto-sampler was used for quantative analyses. Results show that the configuration process producing the lowest VHH concentrations for this particular plant is breakpoint chlorination followed by two-stage active carbon adsorption. It was also shown that: activated carbon is effective in removing VHH if at least 30 minutes of contact time is allowed; the higher the bromide concentration in the water, the higher VHH yield; and the mole ratio of bromide to total organic carbon can indicate the ultimate VHH concentration to be expected. Various pros and cons of chlorine disinfection and ozone disinfection were also examined. (Seigler-IPA)
W80-03324

THE SIGNIFICANCE OF THE ROOT MEAN SQUARE VELOCITY GRADIENT AND ITS CALCULATION IN DEVICES FOR WATER TREATMENT,
Separa (PTY) LTD, Johannesburg, (South Africa).
P. Polasek.
Water S.A., Vol 5, No 4, p 196-207, October 1979. 11 Fig, 1 Tab, 14 Ref.

Descriptors: *Water treatment, *Hydrodynamics, *Mixing, *Hydraulic systems, *Fluid mechanics, Hydraulic models, Physics, Energy gradient, Velocity, Head loss, Flow around objects, Resistence, Kinetics.

Various types of hydraulic and mechanical agitators used in chemical water treatment processes are reviewed in terms of their root mean square velocity gradients. The rate of aggregation of destabilized particles in the water is dependent on the movement of the particles which is effected by the agitation of the water. The intensity of agitation in a system (rapid mixing, rapid agitation, or slow agitation) can be expressed by the instantaneous velocity gradient G in a flow. However, because the value of G varies throughout an agitation system and is difficult to calculate, the root mean square velocity gradient can be substituted. Types of hydraulic (gravitational) agitation systems reviewed are flash mixers, baffled mixers (perforated and slot), orifice mixers, and ring water jump mixers. Baffled channels and sludge blankets are agitation arrangements discussed for the hydraulic agitators. Mechanical agitators reviewed are flash mixers with three agitation arrangements, revolving agitators, and reciprocating agitators. Hydraulic or gravitational agitators are recommended for use only when the nominal flow design can be maintained at all times with no great variation in raw water quality or temperature. The Euler criterion of hydrodynamic similarity was found to be an accurate means of calculation of the useful power imput of mechanical agitation. (Seigler-IPA)
W80-03326

APPARATUS AND METHOD FOR TREATMENT OF FLUID WITH OZONE,
K. Stopka.
U.S. Patent No 4,176,061, 9 p, 7 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1050, November 27, 1979.

Descriptors: *Patents, *Water purification, *Water treatment, Water pollution treatment, Aeration, Ozone, Bubbles, Domestic water, Potable water, Equipment.

The invention relates to a method of and an apparatus for purifying drinking water. The apparatus comprises of an ozonator for providing a gas containing ozone and an aspirator which mixes the gas with water to provide an ozone and water mixture having microbubbles of gas. The mixture is then circulated through an elongated treatment conduit having a length of between about 20 to 40 feet and a diameter less than 1 inch to allow the gaseous ozone to dissolve in the water. Throughout the length of the conduit the ozone oxidizes impurities in the water and provides water having a relatively high purity. The ozonator used to provide ozone is capable of providing a gas having at least 1.2 weight percent ozone, preferably a gas having an ozone concentrations approaching 2 weight percent. The ozonator is comprised of electrodes connected in series by gas flow lines. (Sinha-OEIS)

RESIN TREATMENT IMPROVES HIGH-COLOR GROUND WATER,
Fuhrberg Waterworks, Hannover (Germany, F.R.).
W. Kolle.
Water & Sewage Works, Vol 126, No 1, p 68-69, January, 1979. 5 Fig.

Descriptors: *Anion exchange, *Water treatment, *Humic acids, *Resins, Turbidity, Organic wastes, Filtration, Aerobic bacteria, Chlorination, Ground water.

The treatment of turbid ground water using strong basic anion exchange discussed. The water treated contained iron, manganese, humic acids, and sulfate. About 1,347,000 gallons can be filtered through 36 cubic feet of resin before the next regeneration becomes necessary. The resin is regenerated with a sodium chloride and sodium hydroxide solution which can be used several times. Removals of organics do not significantly increase with decreasing filter velocity. The resin significantly reduces bacterial growth in the drinking water and, correspondingly, chlorine consumption. (Purdin-NWWA)

PERSPECTIVES FROM THREE YEARS EXPERIENCE OF REGIONAL WATER SERVICES IN THAMES WATER AUTHORITY,
Thames Water Authority, London (England).
P. Black, and A. Morrison.
Water Resources Bulletin, Vol 15, No 6, p 1578-1588, December 1979. 7 Ref.

Descriptors: *Water management(Applied), *Administration, *Watershed management, Water supply, Drainage, Rivers, Watersheds(Basins), Sewage, Sewage treatment, Sewage effluents, Sewage disposal, Pollutants, Water pollution, Water quality, Droughts, Regulation, Water re-

sources, *England, *Water authorities, *Thames River(England).

Thames Water is one of ten Regional Water Authorities established in 1974 to manage all water services in England and Wales. This paper looked back at water reorganization and reviewed the achievements and highlights of the past three years. Constitutionally, Water Authorities are a combination of a nationalized industry and local authority. This has advantages and disadvantages. Freedom of action, particularly in financial matters, is constrained by government and official agencies. A severe pollution of the upper Thames and the drought of 1976 tested Thames Water's ability to deal with emergencies. Thames Water does not have an operational monopoly. Private water companies supply one third of the water demand, and local authorities manage nearly all the sewers. But Thames Water's control over planning and investment ensures that the river basin is managed in a coordinated fashion. Tariff structure changes have led the Authority to bill all its consumers direct. The Thames is a small but intensively used river, and vigilance is needed to maintain water quality. Thames Water is proud of the restoration of the tidal Thames from a typical grossly polluted metropolitan estuary to its present excellent condition. The British government intends to establish a national water industry strategic planning organization, but at the same time they affirm that there can be no departure from the principle of integrated river basin management. WATER QUALITY COMMITTEE (ANNUAL REPORT).
American Bar Association, Washington, DC.
Natural Resources Lawyer, Vol 12, No 1, p 273-310, 1979.

Descriptors: *Water quality, *Effluents, *Water quality standards, Legislation, Oil spills, Administrative decisions, Judicial decisions, Toxins, Pollution, Water quality control.

In 1978, developments in the water quality field caused a shift in the focus of Clean Water Act (CWA) litigation. From the effluent guidelines, the controversy shifted to questions involving deadline extensions, effluent standards for toxic pollutants, and enforcement of the National Pollutant Discharge Elinination System (NPDES). A district court decision invalidated federal Environmental Protection Agency (EPA) regulations governing hazardous substances. Hasty legislation was implemented in an attempt to revive the EPA's program governing hazardous substances. The EPA published effluent guidelines and standards of performance for additional industrial categories. EPA programs to establish 'best available technology' effluent limitations for toxic pollutants were continued throughout the year. The EPA also began to implement the 1977 amendments of the CWA. Also adopted or proposed were comprehensive amendments to its regulations governing grants, water quality planning and management, and the NPDES program. These actions and other highlights of the 1978 CWA developments are explored. Legislative activity, judicial decisions, and administrative actions are reviewed in detail. (Quarles-Florida)

ANTI-CORROSION COMPOSITION FOR USE IN AQUEOUS SYSTEMS,
Quatic Chemicals Ltd., Guelph (Ontario). (Assignee).
F. Suzuki.
U.S. Patent No 4,176,059, 7 p, 2 Tab, 10 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1049-1050, November 27, 1979.

Descriptors: *Patents, *Water treatment, *Water quality control, Industrial water, Scaling, Corrosion, Cooling water, Chemical reactions, Heat exchangers, Recirculating water.

A low toxicity, corrosion and scale inhibiting composition for use in recirculating aqueous systems, e.g. in heat exchangers, comprises from about 3-1,000 parts by weight of molybdate, from about 0.5-1,000 parts by weight of an organic cationic or non-ionic surfactant, from about 0.3-1,000 parts by weight of a water soluble polyphosphate and from about 0.05-500 parts by weight of an azole, for example tolyltriazole. The composition is water soluble or water dispersible, and is effective in very small amounts (3-3,500 ppm) for corrosion control of metals such as carbon steel, copper and aluminum exposed to circulating water. (Sinha-OEIS)
W80-03409

METHOD MEANS FOR DE-SILTING WATER,
J. J. Grobler.
U.S. Patent No 4,176,058, 10 p, 8 Fig, 2 Tab, 7 Ref; Official Gazette of the United States Patent Office, Vol 988, No 4, p 1049, November 27, 1979.

Descriptors: *Patents, *Water purification, *Water treatment, *Reservoir silting, Suspended solids, Silts, Sediment control, Floating, Bubbles, Aeration, Agglomeration, Silt recovery.

The invention relates to a method and a means for desilting water. The settling of silt in inland lakes and dams considerably reduce the effective life span of such lakes and dams, and also cause a substantial loss of fertility of the agricultural lands from which the silt originates. The invention provides a method for removing silt particles from water by first agglomerating the silt particles into larger size particles, imparting hydrophobic properties to the larger size particles and floating them to the surface, and removing the floated matter. The invention also provides an apparatus for removing silt particles from water which includes means for feeding into and mixing with the water chemicals selected for agglomerating the silt particles and converting them into larger size hydrophobic particles, means for bubbling air through the water to float the larger size particles to the surface, and means for removing the floated matter. USE OF ENVIRONMENTAL DATA IN ASSESSING THE QUALITY OF IRRIGATION WATER,
Natal Univ., Pietermaritzburg (South Africa). Dept. of Soil Science and Agrometeorology.
A. Cass.
Soil Science, Vol 129, No 1, p 45-53, January 1980. 2 Fig, 3 Tab, 21 Ref.

Descriptors: *Irrigation water, *Water quality, *Data collections, *Model studies, *Africa, Rivers, Irrigation practices, Management, Salinity, Sampling, Rainfall, Evapotranspiration, Soil water, Drainage, Soils, Salt tolerance, *Natal(South Africa), Sodium adsorption ratio, Environmental model.

The quality of irrigation water of selected rivers in Natal is characterized in terms of chemical components related to salinity and sodicity. Using rainfall and evapotranspiration data for each sampling site, and assuming certain management practices, the authors calculated the anticipated soil water salinity and sodicity values for poorly drained soils, obtaining four variables to assess water quality: water salinity and sodicity and soil salinity and sodicity. Grouping the data according to crop salt tolerance and soil sodicity limitations confirms the evaluation of water quality obtained using recently published schemes for assessing irrigation water. The general agreement between schemes for classifying irrigation water indicates the feasibility of using a system of evaluation of water quality based on crop, soil, and climatic characteristics of the area under consideration. Comparing the saturation extract salinity and sodicity of poorly drained soils with salinity and sodicity calculated from this environmental model showed reasonably good agreement, which did not invalidate the general qualitative usefulness of this approach. CENTRIFUGAL WATER OIL SEPARATOR,
Continental Oil Co., Ponca City, OK. (Assignee).
J. K. Sammons, and C. H. Fox, Jr.
U.S. Patent No 4,175,040, 6 p, 4 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 988, No 3, p 699-700, November 20, 1979.

Descriptors: *Patents, *Water pollution control, Water quality control, Separation techniques, Oil pollution, Centrifugation, Equipment, Oil recovery.

A simple, efficient apparatus for reducing the oil content of water recovered from production means and withdrawn from contaminated areas to levels environmentally acceptable is described. A centrifugal oil-water separator comprises an inner spinning bowl having openings near the lower outer periphery for passage of water into an outer bowl which remains stationary. The oil-water mixture is passed to the upper center of the spinning bowl where the oil and water separate. The oil concentrates near the top of the inner bowl. Disposable water is removed from the outer bowl and the oil is recovered from a trough adjacent the top of the spinning inner bowl. (Sinha-OEIS)
W80-03522

WASHER/SEPARATOR SYSTEM FOR DRILLING CUTTINGS IN WATER ENVIRONMENT OIL WELLS,
J. D. Fisher.
U.S. Patent No 4,175,039, 8 p, 4 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 988, No 3, p 699, November 20, 1979.

Descriptors: *Patents, *Water pollution control, *Water quality control, *Oil pollution, Separation techniques, Drilling, Drilling fluids, Equipment, Offshore oil wells, Well cuttings.

A method and apparatus for disposing of cuttings intermingled with fluids, such as oil, which are considered pollutants in water, from a well being drilled in a water environment offshore is described. A receiving tank with an agitation subchamber causes thorough scrubbing of the deposited drilling cuttings. The wash cuttings settle to the bottom of the tank causing the solution level to rise. When a predetermined solution level is reached, an auger, situated at the bottom of the tank, is activated and the collected cuttings are removed. When the solution level drops a sufficient amount for the removal of the cuttings, the auger is shut off and the cycle begins anew. Fresh water washing solution may be used, so that the oil saturated depleted solution may be added to the drilling mud. Collected cuttings may be deposited in the ocean without a slick forming. (Sinha-OEIS)

OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME V-APPENDIX D, WATER SUPPLY AND WATER POLLUTION CONTROL.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 273, Price codes: A99 in paper copy, A01 in microfiche. Prepared by the Federal Water Pollution Control Administration for the Ohio River Basin Coordinating Committee, June 1967. 804 p, 25 Fig, 293 Tab, 13 Append.

Descriptors: *Water resources development, *Ohio River Basin, Water supply, *Water pollution, *Water quality, *Economic prediction, *Population, *Multiple purpose projects, *Water quality control, Planning, Industry, Water demand, Acid mine wastes, Waste load, Pollutants, Stream pollution.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin System, particularly for that portion within Ohio, Indiana, West Virginia, Kentucky, Tennessee, and Illinois. The main purposes are to provide for further flood control measures and to enhance the economic well being of the Basin. This Appendix presents water supply and water pollution control data both for the region as a whole and for each of 13 subbasin areas. The objectives are to determine overall requirements for municipal and industrial water supply and water quality control and to give general appraisals of measures required to meet the indicated needs. The report includes a description of the Basin, its economy, requirements for municipal and industrial water supply, and water quality control needs and problems. The methodological framework consisted of two distinct parts: an input-output econometric model to generate projections for population and economic activity, and an allocation procedure to distribute shares of the Basin projection to the subareas of the Basin. Projected increases in municipal and industrial water supply vary greatly among subbasins. Major water quality control problems include projected waste load increase, acid mine drainage, and heat pollution. Thirteen specific recommendations are made, including secondary treatment for municipal and industrial wastes, designing new sewerage facilities to prevent the necessity of by-passing untreated wastes, storage for streamflow regulation to enable increasing streamflow and waste assimilation during low flow periods, detailed investigations of costs of alternative treatment methods, a program for correcting acid mine drainage, and off-stream cooling methods. Detailed reports are included for the 13 sub-basin areas. (Arnold-NC)

LIQUID TREATMENT APPARATUS,
Ecodyne Corp., Lincolnshire, IL. (Assignee).
D. J. Butterworth.
U.S. Patent No 4,174,282, 7 p, 5 Fig, 12 Ref; Official Gazette of the United States Patent Office, Vol 988, No 2, p 436, November 13, 1979.

Descriptors: *Patents, *Water treatment, *Water quality control, *Filtration, Industrial water, Nuclear powerplants, Filters, Ultra-filtration.

Liquid filters that produce the ultra pure water required from steam generation of electricity are commonly precoated with diatomaceous earth or powdered ion exchange resins. Such filters may have five hundred or more individual filter elements that are each over six feet in length. Full utilization of the liquid treating capacity of the precoat materials requires that the precoat be uniformly applied over the full length of each filter element. When the steam used for electric power generation comes from a nuclear reactor, the filtering apparatus becomes highly radioactive, and the individual filter elements must be capable of being installed and removed from a remote location. During prolonged usage, the dimensions of the individual filter elements may change, as for example when a wound nylon filter elements shrinks during high temperature service. Accordingly, it is an object of this invention to provide an improved liquid treatment apparatus that will fulfill the above requirements. (Sinha-OEIS)

FLOATING-TYPE ANTI-OIL, ANTI-IMPACT AND ANTI-WAVE BARRIER,
Mitsubishi Jukogyo Kabushiki Kaisha, Tokyo (Japan). (Assignee).
N. Toki.
U.S. Patent No 4,174,185, 7 p, 11 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 988, No 2, p 403, November 13, 1979.

Descriptors: *Patents, *Barriers, *Oil pollution, *Pollution abatement, Water quality control, Waves(Water), Floating, Check structures, Protection, Marine structures.

A floating-type anti-oil, anti-impact and anti-wave barrier includes means for intercepting a flow of oil floating on the water and diverting the oil in directions at right angles to the original direction of flow, means for mitigating an impact force exerted by a ship or the like, and means for intercepting waves. The barrier comprises a first float formed by serially arranging at regular intervals elongated boxes in their longitudinal direction. A second float is formed exactly in the same manner as the first float and placed parallel to the first float at staggered positions relative to each other. Floatable spaces having shock-absorbing and intercepting functions are placed between the side surfaces of the floating boxes. Chains or ropes moor the respective floating boxes to each other. The barrier can be utilized as a permanently installed anti-oil and anti-impact waterbreak for a marine oil storage tank, a marine plant, marine air-port, etc. (Sinha-OEIS)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

RESERVOIR STORAGE DETERMINATION BY COMPUTER SIMULATION OF FLOOD CONTROL AND CONSERVATION SYSTEMS,
Hydrologic Engineering Center, Davis, CA.
B. S. Eichert.
Technical Paper No 66, October 1979. 8 p, 8 Ref.

Descriptors: *Flood control, *Model studies, *Planning, *Computer models, Systems analysis, Reservoir operation, Reservoir storage, Water supply, Water storage, Multiple-purpose reservoirs, Hydroelectric power, Water conservation, HEC-5.

This paper presented ways that a comprehensive simulation computer program can be used in planning a water resources system composed primarily of multipurpose reservoirs with flood control as a major project purpose. The computer program HEC-5, Simulation of Flood Control and Conservation Systems, was used to illustrate the ways in which a generalized computer program can be applied to a wide variety of reservoir systems. The HEC-5 model can be used in almost any reservoir system regardless of location, project purposes, and physical conditions in the basin by specifying as input data such items as the configuration of the reservoirs in the basin, the project purposes, streamflow data, channel routing criteria, evaporation data, etc. (Humphreys-ISWS)

OPERATIONAL SIMULATION OF A RESERVOIR SYSTEM WITH PUMPED STORAGE,
Corps of Engineers, Savannah, GA.
G. F. McMahon, V. R. Bonner, and B. S. Eichert.
Hydrologic Engineering Center, Davis, California
Technical Paper No 60, February 1979. 30 p, 3 Fig, 6 Tab, 9 Ref, 2 Append.

Descriptors: *Reservoir operation, *Pumped storage, *River systems, *Systems analysis, *Georgia, Model studies, Multiple-purpose reservoirs, Reservoirs, Hydroelectric plants, Management, Computer models, Evaporation, Electric power, *Savannah River(GA).

This paper described an operational simulation used to evaluate the effects of the addition of pumped storage on hydropower production and recreation useability of a reservoir system. The operational simulation was in support of a study to determine the feasibility of installing pump-turbines at the Richard B. Russell Dam and Lake project, presently under construction and currently authorized for conventional hydropower, flood control, and recreation. The pumped-storage feasibility study addressed the recreational, environmental, hydropower, water supply, and economic impacts of pumped storage and conventional hydropower production at Russell on Corps of Engineer's dams on the Savannah River. The simulation results yielded evidence that system operation is more efficient than operation for at-site requirements, producing less dump energy, pumping energy, and primary energy shortages. In addition, system operation was simulated to reduce pool fluctuations and achieve a better balance of reservoir storage levels than operation with at-site requirements. It can be noted from data presented that the ratio of primary energy shortage to system demand with pumped storage is approximately 10% smaller than for system operation without pumped storage. This indicates that the addition of pumped storage could provide somewhat greater flexibility in meeting system requirements. (Humphreys-ISWS)

SIZING FLOOD CONTROL RESERVOIR SYSTEMS BY SYSTEMS ANALYSIS,
Hydrologic Engineering Center, Davis, CA.
B. S. Eichert, and D. W. Davis.
Technical Paper No 44, March 1976. 32 p, 1 Fig, 3 Tab, 4 Ref.

Descriptors: *Flood control, *Systems analysis, *Reservoirs, *Optimization, *Project planning, Model studies, Flood damage, River systems, Economics, Management, Planning, Hydrology, Annual benefits, Reservoir operation.

This paper discussed the scope of reservoir system formulation, modeling flood control systems, criteria and strategies for system formulation, and illustrated the concepts with applications in recent systems studies. The systems viewpoint applied to reservoir flood control systems includes the physical representation of the system (sites, storage, costs, stream conveyance, basin hydrology) and the economic representation of the consequences of flooding (damage centers, damage potential, frequency of flooding). The flood control system to be formulated consists of the reservoirs and their operating characteristics. Computer Program HEC-5C, 'Simulation of Flood Control and Conservation Systems,' has been developed by The Hydrologic Engineering Center as a generalized tool which can be used to simulate any flood control system. The program was written to be compatible with generally accepted analysis procedures that require data normally developed in the course of studying flood control reservoirs. (Humphreys-ISWS)

APPLICATION OF OPERATIONS RESEARCH TECHNIQUES FOR A PROBLEM IN WATER RESOURCES MANAGEMENT: ECONOMIC APPRAISAL OF CHANGES IN WATER USE INDUCED BY INVESTMENTS INTO NAVIGABLE RIVERS AND CANALS,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Inst. of Operations Research.
K. Hazeghi, W. Schmid, and P. Petalas.
In: Modeling, Identification and Control in Environmental Systems, p 977-988, North-Holland, Publishing Company, 1978. 3 Fig.

Descriptors: *Operations research, *Model studies, *Economic impact, *Water supply, *Navigable

rivers, Simulation analysis, Systems analysis, Cost-benefit analysis, Water allocation(Policy), Mathematical models, Economic efficiency, Water resources development, West Germany, Economic justification, Regional economics, Investment, Weirs, Canals, Engineering structures, Canals, Water utilization, Management.

A computer model was developed to determine net benefits accruing to urban, industrial and agricultural water users from construction of weirs and canals built for navigation purposes in West German river systems. The model, simulating a 1-yr period, analyzes costs of the most preferable alternative water supply and discharge (S/D) system. Economic effects are posited in physical terms accruing to water users by comparison of the channel-reservoir system under simulated conditions with and without the weirs and canals, as affecting supply of water, water quality and discharge capacity as well as utilization by water users for withdrawal and discharge purposes. Alternative costs in the model are those of the optimal water supply and discharge system needed under assumption of no construction of the canals and weirs, that will satisfy all user requirements if the construction were to take place. The model treats the S/D system in three interacting networks: an X network for water supply only, a Y network for water discharge only and a Z network performing both functions simultaneously, as well as that of water treatment plants. Criteria for benefits with alternate S/D systems are annual costs, the sum of yearly operation costs and the annuity of investment costs. Mathematica formulation of the problem, i.e., determination of the most economical alternate S/D system, leads to an optimization problem with partly linear and partly nonlinear constraints and nonlinear objective functions. OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME III-APPENDIX B, PROJECTIVE ECONOMIC STUDY.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 271, Price codes: A99 in paper copy, A01 in microfiche. Prepared for the Ohio River Basin Coordinating Committee by Arthur D. Little, Inc., August 1964. 436 p, 7 Fig, 87 Tab, 12 Append.

Descriptors: *Water resources, *Water resources development, *Economic prediction, *Capital, *Planning, *Models, *Forecasting, *Ohio River Basin, *Employment, *Industrial production, Econometrics, Economics, Labor supply, Population, Methodology, Electric power, Regional development, Resources, Linear programming, Water policy.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin System, particularly within Ohio, Indiana, West Virginia, Kentucky, Tennessee, and Illinois. The main purposes are to provide for further flood control measures and to enhance the economic well being of the Basin through water resource development. This Appendix presents the base economic data and projections for the area, the methodological framework used in the study, and a report on implementation of the projection model. The methodological framework consisted of an econometric forecasting model used to derive economic activity projections in the Basin as a whole, and an allocation procedure used to distribute projected output and employment estimates among the 19 subareas of the Basin. The purpose of the model was to project levels of industrial and government activity, income and employment to 1980 and 2010. The future labor supply was projected on the basis of population trends. Population projections were made using the component or cohort-survival method. The major procedures required to implement the projection model are outlined. The operational process was divided into three phases: (1) demographic projections of population and labor force; (2) derivation of base year values, projection parameters, and demand projections; and (3) reconciliation of results of the demographic projection with those of the demand projections. Detailed descriptions of the procedures are provided in the appendices. (Arnold-NC)

AN URBAN RUNOFF MODEL FOR TULSA, OKLAHOMA,
Texas Univ. at Austin. Center for Research in Water Resources.
L. R. Beard, and S. Chang.
August 1978. 209 p, 6 Fig, 19 Tab, 63 Ref, 4 Append.

Descriptors: *Rainfall-runoff relationships, *Streamflow forecasting, *Model studies, *Streamflow, *Linear programming, *Models, *Mathematical modes, Tulsa(OK), Mingo Creek(OK), Haikey Creek(OK), Loss-rate functions, Drainage, Rational formula, Regression analysis, Hydrograph analysis, Unit hydrographs, Urbanization, Impervious surfaces.

The purpose of this study was to develop a method to adjust flood flows for effects of urbanization in the Tulsa (OK) area. As no Tulsa runoff data were available, data for similar areas were used in model development. Adjustment of flood flows to account for urbanization was accomplished by applying a rainfall-runoff model to representative storms and adjusting the parameters to reflect the various effects of urbanization. A literature survey was undertaken to assess available information on all existing hydrologic models. Twenty-five models were reviewed, of which only 7 were considered suitable for this application. The model finally chosen was the Flood Hydrograph Package of the Hydrologic Engineering Center (HEC-1). The package was used to derive model coefficients for each of the 114 floods studied. The general model was found to be highly flexible. Initial full-model and restricted-model calibrations were undertaken, and special calibrations were undertaken for treatment of impervious areas. The Clark unit-hydrograph parameter and loss parameter were separately related to drainage basin parameters by use of multiple linear regression. This procedure appears to produce excellent results in reproducing observed flood hydrographs from recorded rainfall. Applications of the model were made for Mingo and Haikey Creeks to compute runoff from the 1976 storm in the area. Data used in this study provide no evidence that urbanization appreciably affects runoff concentration times in the absence of channel improvements. About 40% of the impervious area appears effective in increasing volume of runoff. It is believed that the procedures used in the study are highly satisfactory for evaluating changes in runoff rates due to urbanization. (Arnold-NC)

AN APPROACH TO THE CONSTRUCTION OF THE REGIONAL WATER RESOURCE MODEL,
International Inst. for Applied Systems Analysis, Laxenburg (Austria).
M. Albegov, and V. Chernyatin.
Research Memorandum RM-78-59, November 1978. 38 p, 9 Fig, 8 Ref.

Descriptors: *Models, *Water resources, *Bulgaria, *Mathematical models, *Regional analysis, *Modeling systems, *Water quality, *Water management(Applied), *Regional development, Water resources planning, Model studies, Danube River, Analytical techniques, Water demand, Water supply, Water quality, Reservoirs, Irrigation, Water costs, Economics, Unit costs, Annual costs, *Silistra region(Bulgaria).

The authors attempt to define a special regional water resource model as part of a more general system of regional models. This model system embraces a multi-stage solution approach to regional problems, examining settlements and pollution; labor and capital; and the location of industry, agriculture, and public services as factors in the determination of water supply needs. The principal system approach simultaneously analyzes water supply costs of all subregions of a selected study area, using data such as average water cost per cubic meter, maximum water available for consumption, and the total expenses for the water supply. The primary goal for this kind of modeling--regional development (RD) modeling--is to determine the location and development level for regional production units for the area's economy. The mathematical model measures water supply, comparing the feasibility of meeting different water demands at various supply schedules; and water quality management parameters which are examined in light of water withdrawal levels in a given number of regional subregions, or districts, resulting in or having various pollution concentration levels. The first version of the water supply model was applied to Silistra, Bulgaria. Findings indicate that water unit costs are much higher during intensive irrigation periods, these costs increase when the irrigated land is moved farther from the river water source (Danube River), and water costs increase strongly in areas lacking reservoirs. (Arnold-NC)

THE DEVELOPMENT AND SERVICING OF SPATIAL DATA MANAGEMENT TECHNIQUES IN THE CORPS OF ENGINEERS,
Hydrologic Engineering Center, Davis, CA. Planning Analysis Branch.
R. P. Webb, and D. W. Davis.
Technical Paper No 55, July 1978. 24 p, 7 Tab, 13 Ref.

Descriptors: *Model studies, *Analytical techniques, *Flood control, *Flood plain management, *Spatial data management, *Flood damage, Computer models, Computer techniques, Flood hazard, Flood data, Water resources planning, Planning, Environmental effects, Flood plains.

This study presents a system for managing hydrologic data and performing a comprehensive analysis of the impacts of existing and alternative future land use development patterns for floodplains. Spatial data management and processing techniques are employed using the group of software contained under DATA BANK PROCESSING INTERFACE. Various alternatives are evaluated for flood hazards for a specific storm event such as the 100-year flood, or for a range of storm events; monetary damages for a specific flood event and the expected value of annual damages are evaluated for 8 different alternatives; and alternative environmental impacts are evaluated. A series of Expanded Flood Plain Information Studies (XFPI) was undertaken using the techniques developed by the Corps. The original study was in the Oconee River Basin and has been completed; several others are near completion. Results of the Trail Creek watershed study are presented. The watershed occupies 12 miles of the Oconee pilot study area of 300 miles, and includes portions of Athens (GA). The area is 10% urban and expected to grow to 20-30% by 1990. The data bank developed for Trail Creek included 15 data variables. Flood hazard analysis presents results of evaluating existing and 1990 alternative conditions. Annual damage assessments for a range of hydrologic conditions and land use control policy sets are presented. Nonstructural flood plain evaluations using spatial data management techniques are presented. Environmental assessments include current and 1990 Trail Creek pollutants. Recommendations applicable to tasks such as spatial data management include the need to provide the computer software with a permanent home, using business-like computer code generation, and careful selection of studies. (Arnold-NC)

FLOOD DAMAGE ASSESSMENTS USING SPATIAL DATA MANAGEMENT TECHNIQUES,
Hydrologic Engineering Center, Davis, CA. Planning Analysis Branch.
D. W. Davis, and R. P. Webb.
Technical Paper No 57, November 1978. 25 p, 4 Fig, 2 Tab, 5 Ref.

Descriptors: *Analytical techniques, *Flood damage, *Flood control, *Frequency analysis, *Flood plain management, *Spatial data management, Flood plains, Non-structural alternatives,

Computer techniques, Flood data, Water resources planning, Flood stage, Structures, Geography, Management, Land use, Hydrology.

This study discusses the basic concepts of a spatial data management approach to flood damage appraisals and highlights its integrated use with more traditional individual structure approaches. Two major types of appraisals are the 'event' analysis, involving the development of a damage potential function and hydrologic data for the flood event of interest; and the expected annual damage analysis which employs the methods of the first analysis plus adding data for representing a flow-exceedance frequency function. Development of flood damage potential functions is achieved by stratifying the particular flood plain by damage potential, sampling stratified categories, then projecting damage potential for the entire study area. For accomplishing these tasks, use of the grid cell data bank is employed, with coding of various cells for type of existing land use, damage reach, and particular reference flood. Summary damage evaluations will then be possible, each comparing the existing damage reaches with the type of land use policy existing for that area. An integrated spatial and inventory approach was designed to make these programs more useable by the public and local/state agencies. The applications made to date confirm the soundness of the approach and indicate that the methods should aide in continuing the important movement toward a geographic approach to flood plain management. (Arnold-NC)
W80-03589

SPATIAL DATA ANALYSIS OF NONSTRUCTURAL MEASURES,
Hydrologic Engineering Center, Davis, CA. Planning Analysis Branch.
R. P. Webb, and M. W. Burnham.
Technical Paper No 46, August 1976. 19 p, 8 Fig, 4 Tab, 2 Ref.

Descriptors: *Model studies, *Analytical techniques, *Flood control, *Nonstructural alternatives, *Flood protection, *Flood plain management, *Flood damage, Flood plains, Planning, Flood proofing, Spatial analysis, Computer models, Structural damage, Flood data, Water resources development.

This article explains how evaluations of nonstructural flood loss reduction measures for existing and alternative future land use patterns can be made. A spatial data analysis model is advanced which employs the processing of spatial geographic data into a grid cell data bank which may then be accessed and manipulated in a computer bank. Inputs into the program include a description of flood damage reach boundaries; reference flood profiles; composite damage functions; and aggregate damage function data (e.g., value of the structure, density of development in the immediate area, stage vs. % damage for structure). Two major steps are involved in damage function development: (1) development of elevation-damage function at each cell, and (2) aggregation of cells to index locations by determining damage reach, index location, cell reference, then aggregating inputs for all cells. This method should make possible rapid evaluation of flood damage potential for existing and alternative future land use conditions and determination of potential flood damage resulting from various nonstructural measures. (Arnold-NC)

6B. Evaluation Process

A DYNAMIC REGIONAL IMPACT ANALYSIS OF FEDERAL EXPENDITURES ON A WATER AND RELATED LAND RESOURCE PROJECT -- THE BOISE PROJECT OF IDAHO. PART I: DIRECT ECONOMIC IMPACTS, ECONOMICS SUBPROJECT,
Idaho Univ., Moscow. Dept. of Agricultural Economics.
R. Long, T. Nelson, and G. Hines.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-144280, Idaho Water Resources Research Institute, University of Idaho Research Technical Completion Report, March 1979. Volume I of V. 111 p, 7 Fig, 28 Tab, 26 Ref, 5 Append, OWRT C-6276(5226)(2).

Descriptors: *Idaho, *Cost-benefit ratio, *Economic impact, *Irrigation systems, Cereal crops, Field crops, Vegetable crops, Forages, Reservoir storage, Hydroelectric power, Flood control, Crop production, Agriculture, Irrigation programs, Boise Project.

Direct cost and return information is presented for the Boise Project, originally an irrigation and power project in southwestern Idaho. The Project was built by the Bureau of Reclamation from 1910 to 1956 and is now managed for irrigation, power, recreation, and flood control. Irrigated acreage in the area has increased from 51,377 acres to the current 390,000 acres with irrigation water from the Boise and Payette Rivers now stored in five reservoirs. Pre-project crops were primarily hay, grain, and pasture crops with a few seed crops, fruits, and vegetables. From 1910 to 1940 there was little change in crop patterns with forage and cereal crops continuing to dominate percentages while overall regional output increased. From 1940 to 1973 crop patterns changed with the technologic and economic boom following World War II. Forage and cereal crops percentages dropped while seed, fruit, vegetable, and field crop percentages increased. Benefit-cost ratios (value added per dollar of project cost) are given for each year from 1910 to 1973. The lowest ratio occurred in 1932 at a negative $0.59 and the highest ratio occurred in 1947 with $21.29. The project was only marginally economically successful prior to 1940, however, after that date a rapid upswing occurred. For every dollar spent on the project after 1940 about $5 in income resulted with the ratio for 1973 being $9.94. (Seigler-IPA)
W80-03309

A DYNAMIC REGIONAL IMPACT ANALYSIS OF FEDERAL EXPENDITURES OF A WATER AND RELATED LAND RESOURCE PROJECT -- THE BOISE PROJECT OF IDAHO, PART III: ECONOMIC SCENARIO OF THE BOISE REGION 'WITHOUT' A FEDERAL IRRIGATION PROJECT, ECONOMICS SUBPROJECT,
Idaho Univ., Moscow.
T. L. Nelson, C. C. Warnick, and C. J. Potratz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-144298, Idaho Water Resources Research Institute, University of Idaho. Research Technical Completion Report, March 1979, Vol III of V, 61 p, 4 Fig, 16 Tab, 17 Ref, OWRT C-6276 (5226) (4).

Descriptors: *Economic justification, *Economic prediction, *Comparative benefits, *Idaho, *Model studies, Irrigation systems, Cost-benefit ratio, Econometrics, Monetary benefits, Federal project policy, Projects, Estimated benefits, Project benefits, Project planning, Boise Project.

Two models were used to estimate the economic conditions in Idaho and the Boise region if the federally funded Boise Irrigation Project had never been built. A hydrologic model of the natural unregulated flows of the Boise and Payette Rivers was used to estimate the gross crop output that would have occurred without the Boise Project. Based on data from the hydrologic model an interregional trade flow model was also developed. Most of the precipitation for the two watersheds occurs as snow resulting in a heavy spring runoff. Flows then decline as summer progresses with August flows often being only 15% of June flows. Without the storage water provided by the Boise Project there would be little water for irrigation during the critical summer season. From the hydrologic model, average annual irrigation diversions available from both rivers without the Project was 705,000 acre feet. This diversion would have irrigated approximately 261,000 acres which in turn would produce $8,600,000 in crops by 1973. A comparison of these 'without' results to actual 'with' data shows that in 1972 while the 'without' acreage represents 77% of the actual 'with' acreage, the 'without' diversion is only 36% of the 'with' diversion. Further, the 'without' income represents only 18% of the 'with' diversion. Trade flow model results show that area output 'without' the Project would have been $1.6 billion compared to $1.8 billion 'with' the project as of 1970. The pattern for income is similar. The relative success of the Project is justified on the basis of economic efficiency. (Seigler-IPA)
W80-03311

A DYNAMIC REGIONAL IMPACT ANALYSIS OF FEDERAL EXPENDITURES OF A WATER AND RELATED LAND RESOURCE PROJECT -- THE BOISE PROJECT OF IDAHO, PART IV: A SOCIAL IMPACT ANALYSIS OF FEDERAL EXPENDITURES ON A WATER RELATED RESOURCE PROJECT: BOISE PROJECT, SOCIAL SUBPROJECT,
Idaho Univ., Kimberly. Water Resources Research Inst.
J. E. Carlson, and M. J. Sargent.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-144306, Research Technical Completion Report, March 1979. Vol IV of V, 134 p, 34 Fig, 6 Tab, 32 Ref, 1 Append. OWRT C-6276 (5226)(5).

Descriptors: *Idaho, *Social impact, *Project benefits, *Comparative benefits, Irrigation systems, Social change, Social aspects, Community development, Human population, Public health, Recreation, Education, Law enforcement, Boise Project.

Social changes resulting from the Boise Project, an irrigation and power project in southwestern Idaho are analyzed. The Project was built by the Bureau of Reclamation between 1910 and 1956 and is now managed for irrigation, power, recreation, and flood control. Both spatial and temporal impacts on Ada and Canyon Counties and changes from 1940 through 1970 are analyzed. A comparison is made of the quality of life 'with' the Project and 'without' the Project. Quality of life indicators used include education, housing and neighborhood, formal achievement, health (mental and physical), law enforcement, accessibility, and recreation. The most significant social impact has been on population numbers with the Project adding 38,000 to 22,000 residents from 1940 to 1970. Farm population has declined but not as sharply as it would have without the Project. The Project has apparently had little impact on education. Income has somewhat increased with fewer families classified as poverty level, however, the percent employed is little changed. Housing has been unaffected except for a quality improvement in 1940. Health has also been unaffected. Violent crimes and accessibility were slightly increased by the Project. Water-based recreation was greatly increased by the Project. Overall the apparent social impacts of the Boise Project have not been major. (Seigler-IPA)
W80-03312

A DYNAMIC REGIONAL IMPACT ANALYSIS OF FEDERAL EXPENDITURES ON A WATER AND RELATED LAND RESOURCE PROJECT -- THE BOISE PROJECT OF IDAHO, PART V: ENVIRONMENTAL IMPACTS,
Idaho Univ., Moscow. Dept. of Geography.
J. E. Hultquist.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-144314, Research Technical Completion Report, March 1979. Vol V of V, 114 p, 16 Fig, 20 Tab, 102 Ref. Idaho Water Resources Research Institute, University of Idaho. OWRT C-6276 (5226)(6).

Descriptors: *Idaho, *Environmental effects, *Irrigation, Habitats, Ecology, Productivity, Project benefits, Comparative benefits, Projects, Irrigation systems, Watersheds(Basins), Reservoir storage, Reservoir silting, Erosion, Water supply, Boise Project.

'Without Project' scenarios are compared to actual existing conditions to assess the environmental impact of the Boise Project, an irrigation and power project in southwestern Idaho. The Project was built by the Bureau of Reclamation between 1910 and 1956 and is now managed for irrigation, power, recreation, and flood control. One 'with'

scenario examined is the natural flow scenario. Without any storage only the diversion of natural flows could have been used for irrigation. Most of the area's precipitation is in the form of snow producing a heavy runoff and high flows in spring and low flows in summer. The low flows of July and August would have determined the maximum amount of land to be irrigated for the entire season. Estimated average annual irrigated acreage from natural flow is 152,500 acres. A second 'without' scenario, the storage scenario assumes the construction of only a 200,000 acre-foot reservoir. This storage capacity would provide an additional 48,800 irrigated acres. It is difficult to attribute many environmental changes directly to the Boise Project as it is evident that a great many changes were underway prior to the Project. Environmental changes are discussed along with various environmental evaluation methodologies. (Seigler-IPA)

ARCHEOLOGICAL INVESTIGATIONS ALONG THE SALT-GILA AQUEDUCT,
Museum of Northern Arizona, Flagstaff.
P. H. Stein.
Technical Report No DI-BR-APO-CCRS 79-3, November 1979. Prepared for the U.S. Bureau of Reclamation, Arizona Projects Office, 181 p, 17 Fig, 15 Tab, 112 Ref, 5 Append.

Descriptors: *Arizona, *Archaeology, *History, *Dating, *Surveys, *Arid lands, Southwestern U.S., Irrigation practices, Agronomy, Agriculture, Water storage, Droughts, Hohokam culture, Salt-Gila Aqueduct, Central Arizona Project.

Seventy archeological and/or historical sites were recorded during an intensive archeological survey of the area involved in the construction of the proposed Salt-Gila Aqueduct (SGA), a component of the Central Arizona Project designed to supplement the water supply of central and southern Arizona. The SGA project area, located in the Southern Basin and Range physiographic province, is characterized by through-flowing drainage systems with no natural lakes. With an average annual rainfall of less than 10 inches and a high evapotranspiration rate, the Gila River was the main perennial source of water in aboriginal times. A site file search was conducted to gather data on all sites previously recorded. This search identified 51 sites. Although the presence of man in the American Southwest is documented from at least 11,000 B.C., the distribution of sites from the survey indicated that the most valuable period of archeological study was the Hohokam period (300 B.C. to 1450 A.D.). The Hohokam were a sedentary people practicing both canal irrigation and floodwater farming. They excelled in the production of stone, shell, and clay crafts. A testable model of riverine and nonriverine Hohokam settlement/subsistence was developed. Also, different levels of sampling intensity were compared for locating nonsite remains. Excavation of various sites should provide more conclusive data. (Seigler-IPA)

Geothermal Resources Council, Transactions, Vol 3, p 99-102, September, 1979. 3 Fig, 2 Tab, 2 Ref.

Descriptors: *Geothermal studies, *Drilling, *Estimated costs, Deep wells, Inflation, Planning, Regression analysis.

Nineteen geothermal wells of varying depths between 1500 and 10,000 feet and similar diameter were used in a statistical analysis of well construction costs. The general trend when the data points are plotted is exponential with depth. However, costs at any given depth can vary appreciably due to drilling conditions and unexpected problems. The straight line fit should not be extrapolated to obtain costs for geothermal wells less than 1500 feet deep. All the cost data were corrected for inflation. Since 1974, well drilling costs have almost doubled. (Purdin-NWWA)

DAMS AROUND THE HOLY CITY OF MEDINA, AND THE PRESSURE ON ITS WATER SUPPLY,
Durham Univ. (England). Dept. of Geography.
M. S. Makki.
Journal of Arid Environments, Vol 2, No 4, p 363-367, Dec 1979. 1 Fig, 12 Ref.

Descriptors: *Urbanization, *Paleohydrology, *Dams, *Water demand, Environmental effects, Quaternary period, Tertiary period, Infiltration, Water supply, *Saudi Arabia, *Medina.

Recent intensive use of machine pumps, drier weather, increasing urbanization, and improvements in health care around Medina, a holy city of more than 100,000 which receives about a million pilgrims yearly, have created a growing problem of providing water for domestic and agricultural use. Medina's water now comes from a huge water storage trap formed from Tertiary and Quaternary basalt outpourings south of the city. It covers the ancient alluvium into which rainwater would otherwise infiltrate and protects groundwater from evaporation. The resultant limitation on infiltration along with the increasing extraction of groundwater have created imbalances in which demands far exceed precipitation. Several dams built in the area to increase the recharge by rainwater to the aquifer, are described in terms of their varying effects on valley floods and their implications in meeting water demands. It is concluded that the recent flexibility of official policy toward urban expansion, together with lack of water, have badly affected the natural environment around Medina. (Tickes-Arizona)

W80-03569

OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME XIII-APPENDIX L, NAVIGATION.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 280, Price codes: A06 in paper copy, A01 in microfiche. Prepared for the Ohio River Basin Coordinating Committee, April 1968. 113 p, 25 Fig, 15 Tab, 1 Append.

Descriptors: *Water resources development, *Multiple purpose projects, *Ohio River Basin, *Resources development, *Navigation, *Comprehensive planning, *Projections, *Navigable rivers, Transportation, Water use, Canals, Commerce, Waterways, Water demand, Natural resources, Water policy, Regional development, Navigable waters.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin System, particularly within Ohio, Indiana, West Virginia, Kentucky, Tennessee and Illinois. The main purposes are to determine the need for further flood control measures and to enhance the economic well being of the Basin. This Appendix delineates problems and development needs of the Basin's navigation system and presents a methodology for projecting annual gross demands on that system. By 2020, annual tonnage and ton-miles moved on the Ohio River are projected to increase more than 5 times the 1965 traffic; on tributaries in the study area, projected growth would be more than threefold. Additional demand for water-borne freight exists in areas of the Basin where there is presently no service but where potential waterways should be feasible before 2010. If these system extensions are constructed as needed, 6 billion ton-miles are projected to move on 320 new waterways by 2020. Structural measures are recommended to meet increasing demands, including deeper navigation channels and a lock-and-dam modernization program. In addition, technological and managerial measures will be necessary to meet projected needs. Total initial construction costs of the navigation development plan to 2020 is estimated at $1.8 billion, exluding projects in the 1965 program. Specific navigation problems and potential solutions for these problems are presented for each of the rivers in the Ohio River Basin. A comprehensive development program is also presented for navigation, including existing and projected new waterways. (Arnold-NC)
W80-03570

OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME XII-APPENDIX K, DEVELOPMENT PROGRAM FORMULATION.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 279, Price codes: A14 in paper copy, A01 in microfiche. Prepared for the Ohio River Basin Coordinating Committee, July 1968. 317 p, 22 Fig, 28 Tab, 4 Attachments.

Descriptors: *Water resources development, *Water resources planning, *Water demand, *Ohio River Basin, *Administration, *Multiple purpose projects, *Regional development, *Water supply development, Planning, Economic projections, Governments, Water resources, Recreation, Power demand, Water policy, Natural resources, Water quality.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin System, particularly within Ohio, Indiana, West Virginia, Kentucky, Tennessee and Illinois. The main purposes are to determine the need for further flood control measures and to enhance the economic well being of the Basin. This Appendix presents background information, planning concepts and procedures, and--as an end product--a generalized plan for the development and management of water and related land resources of the Basin. The study region comprises 163,000 square miles and is rich in water, mineral and other resources. Population will triple by the 21st Century, with water use and demand increasing greatly for such activities as electric energy requirements, recreation, municipal and industrial water use, hunting and fishing, and water-borne freight. Flood control improvements will be needed. Control of stream flows and coordinated development and use of streams and impounded waters will be important in meeting future demands on available resources. The proposed Framework Program plan would call for tripling reservoir storage capacity from 1980 to 2020, increasing hydroelectric capacity by the same amount, adding 15-30% more acreage to public lands to meet projected recreation demand, and the acceleration of all water-resource-oriented planning programs in existence to cope with this increased demand. (Arnold-NC)
W80-03571

OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME X-APPENDIX I, ELECTRIC POWER.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 278, Price codes: A05 in paper copy, A01 in microfiche.

Prepared for the Ohio River Basin Coordinating Committee by the Federal Power Commission, 1966. 92 p, 13 Tab, 6 Exhibits.

Descriptors: *Water resources development, *Electric power, *Ohio River Basin, *Electric power demand, *Electric power production, *Cooling water, Water demand, Hydroelectric power, Water policy, Thermal power.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin System, particularly within Ohio, Indiana, West Virginia, Kentucky, Tennessee and Illinois. The main purposes are to provide for further flood control measures and to enhance the economic well being of the Basin. This Appendix assesses data for and predicts future demand for power in the Ohio Basin. Energy requirements for power generation in the Basin are expected to increase about 200% between 1963 and 1980 and an additional 370% between 1980 and 2020. Total generating capacity is expected to increase 225% between 1963 and 1970 and an additional 75% from 1970 to 1980, but no specific growth forecasts are given for 1980-2000. Hydroelectric development will increase somewhat, but then level off near the end of the century as nuclear power plays a greater role in meeting energy requirements. Available surface and ground water resources in the Basin appear to be sufficient to satisfy cooling water needs of thermal electric generation in the foreseeable future. With more energy efficient thermal plants coming on line by 1980, cooling water requirements will be gradually reduced. Because of unforeseen technical advances in power plants, exact predictions of cooling water requirements for the period beyond 2000 are not feasible at this time (1966). (Arnold-NC)
W80-03572

OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME IX-APPENDIX H, OUTDOOR RECREATION.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 277, Price codes: A09 in paper copy, A01 in microfiche. Prepared by the U.S. Department of the Interior, Bureau of Outdoor Recreation for the Ohio River Basin Coordinating Committee, June 1966. 197 p, 4 Tab, 21 Plates, 4 Append.

Descriptors: *Water resources development, *Outdoor recreation, *Ohio River Basin, *Multiple purpose projects, *Recreation demand, Recreation facilities, Projections, Natural resources, Planning, Land use, Social aspects, Water policy, Economics.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin System, particularly that portion in Ohio, Indiana, West Virginia, Kentucky, Tennessee, and Illinois. The main purposes are to provide for further flood control measures and to enhance the economic well being of the Basin. This Appendix assesses the demands and needs for water related outdoor recreation opportunities of the Basin by regional summary and for each of the Basin's subareas in the years 1980, 2000, and 2020. All 19 subareas have a need for additional development to meet future needs. For the 3 target years, demands will increase more than 2-fold, 4-fold, and 6-fold, respectively, over 1960 demands. Recreation needs by 2020 are projected to be 971.3 million recreation days, with resource requirements estimated to be up to 8,741,700 land acres and 9,207,900 water acres by 2020, at development costs of up to $4,370,800. The report recommends planning and development programs for all 19 subareas, with special attention given to 7 subareas. Detailed studies of navigation waterways should be undertaken to determine the extent they can be used to alleviate recreational needs; scenic roads and parkways should be developed, and potential scenic riverways studied to determine their recreation capabilities; and recreational programs of all agencies administering recreation facilities should be considered in future planning. (Arnold-NC)
W80-03573

OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME VIII-APPENDIX G, FISH AND WILDLIFE RESOURCES.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 276, Price codes: A06 in paper copy, A01 in microfiche. Prepared by the U.S. Department of the Interior, Fish and Wildlife Service, Bureau of Sport Fisheries and Wildlife, and Bureau of Commercial Fisheries for the Ohio River Basin Coordinating Committee, 1963. 99 p, 8 Tab, 8 Plates, 12 Photographs, 3 Supp

Descriptors: *Water resources development, *Fish and wildlife, *Multiple purpose projects, *Ohio River Basin, *Fish management, *Commercial fishing, *Sport fishing, *Hunting, *Wildlife management, Freshwater fish, Fisheries, Natural resources, Aquatic life, Planning.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin System, particularly that portion in Ohio, Indiana, West Virginia, Kentucky, Tennessee, and Illinois. The main purposes are to provide for further flood control measures and to enhance the economic well being of the Basin. The purpose of this Appendix is to analyze fish and wildlife resource problems in the Basin and to furnish general solutions, particularly related to potential water development projects. Gross demand for sport fishing will increase 62% by 1980, 88% by 2000, and 138% by 2020 over 1960 actual Basin use. Hunter demand will also increase though at a slower rate--32% by 2020. Neither fish nor game resources will be adequate to meet these needs. Expanding human populations limit the Basin's habitat base. Providing for projected 1980 fishing needs could involve an annual estimated expenditure of $1,100,000-$3,900,000. Projected sub-basin sport fishing needs could be met by: creating ponded waters; improving water quality by curbing pollution; providing equitable zoning of use on available waters; rehabilitating or reclaiming fishing waters; acquisition of greater public access to fishing waters; planning for future needs; and avoiding degradation of habitats. Future hunter needs could be met by more intensive management of public hunting lands; introduction of new species; opening new hunting lands; and planning. (Arnold-NC)

DESIGNING FOR DEVELOPMENT: WHAT IS APPROPRIATE TECHNOLOGY FOR RURAL WATER AND SANITATION.
D. Henry.
Water Supply and Management, Vol 2, No 4, p 365-372, 1978. 1 Fig.

Descriptors: *Rural water supply, *Developing countries, *Water technology, *Rural areas, *Water resources development, *Water supply development, Technology, Water supply, Strategies, International Development Research Centre, Costs, Planning, Resources development, Research and development.

In developing countries 90% of the populations live in rural areas. In these societies the non-conventional energy sources are the electric motor and diesel engine and the conventional energy sources are animal and human power, sometimes supplemented by wind and water power. Women carry almost 100% of the water for domestic purposes, spending more than 50% of their time doing so. The International Development Research Centre has been conducting research of rural water technology. Their research philosophy focuses on: (1) national priority; (2) utilization of local personnel and resources; (3) rural emphasis; (4) applicability, and (5) research training. A major problem in rural areas is that these people do not have a revenue collection system through which payments for both capital and operating costs of rural water supply programs can be collected. One of the most essential tools in the rural water field will be an effective system for the generation, collection and dissemination of information. Basic criteria for selection of rural water technology are that any technology must be capable of fabrication within the developing country; and that it must be reliable, have a reasonable cost and be maintainable by villagers. The most difficult part of the appropriate technology equation is getting the technology into the marketplace after the design has been tested and optimized. In developing rural water systems the challenge is to produce machines that will make poor people more productive and to ensure that the villager becomes an active member of the research team since he is the focal point of all this activity. (Iervolino-NC)

IDENTIFYING RESEARCH PRIORITIES IN WATER DEVELOPMENT,
R. Chambers.
Water Supply and Management, Vol 2, No 4, p 389-398, 1978. 11 Ref.

Descriptors: *Research priorities, *Water resources development, *Rural water supply, *Water demand, Water supply, Developing countries, Productivity, Equity, Rural areas, Planning, Decision-making, Social aspects, Research and development.

Factors influencing priorities in water-related research are discussed, along with complementary and corrective approaches, and examples of the kinds of priorities which might emerge. The focus concerns improving the levels of living of the people, especially the poorer people, in rural areas of the third world. Professional training and prestige, biases of dominance, difficulties of studying water, and the problem-orientation are factors which influence priorities in water-related research. In determining research priorities, more specific criteria might include productivity, equity, stability, quality of life, and non-seasonality. A suggested water research and development approach to counterbalance current biases would include five main complementary elements: (1) working with and learning from rural people; (2) holistic appraisal; (3) opportunity orientation; (4) creative lateral thinking; and (5) practicality. Changes following on from water-related research might help rural development generally and the poorer rural people in particular. Some priorities for research include water reform, traditional domestic technologies, water-appropriating technology, water conservation and storage, and slack resources for the poor. The potential for increased agricultural production and more equitable distribution of water to farmers on existing irrigation systems is enormous. Organization and management of irrigation bureaucracies is needed to ensure more productive and equitable distribution of water. The design and choice of pump technology has great potential and needs to be investigated further. Obvious opportunities are presented by reducing evaporation from open bodies of water, reducing seepage from channels, dams and tanks, and the artificial recharge of groundwater. (Iervolino-NC)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

ECONOMICS OF IRRIGATION AND THE INSTITUTIONAL AND PRICING SYSTEMS OF WATER IN ISRAEL,
Hebrew Univ., Rehovot (Israel). Faculty of Agriculture.
D. Yaron.
Agricultural Water Management, Vol 2, No 3, p 203-216, Nov 1979. 1 Fig, 3 Tab, 30 Ref.

Descriptors: *Economic efficiency, *Irrigation efficiency, *Pricing, *Planning, Institutional constraints, Market value, Water rates, *Israel, Water conservation, Water Resources Development.

Economic analyses of irrigation performed in Israel show the many facets and complexities of ascertaining the value of irrigation water. This paper reviews some of the relationships existing between progress made in the economics of irrigation and the institutional framework and system of water pricing. Israel provides a good example because of its fast rate of development of irrigated land, adaptation and/or development of advanced irrigation methods, and the scarcity of irrigation water which emphasizes the need for an efficient use of this resource. It is suggested that the essence of the relationships discussed is that under conditions of water scarcity and the existence of a conceptional understanding of the economic relationships involved in irrigation, pressure develops to adapt the institutional and pricing systems to obtain a more rational use. This adaptation process must overcome resistance typical of any institutional framework and the pressure of opposing interest groups. (Tickes-Arizona)
W80-03554

MANAGING SMALL WATER SYSTEMS: A COST STUDY, VOLUME II,
ACT Systems, Inc., Winter Park, FL.
J. I. Gillean, W. K. Adams, and R. M. Clark.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-126410, Price codes: A14 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-147b, September 1979. 304 p, 25 Fig, 4 Tab, 2 Ref, 3 Append. 68-03-2071.

Descriptors: *Cost-benefit analysis, *Econometrics, *Water costs, *Data collections, Utilities, Water works, Water rates, Taxes, Water delivery, Labor, Regression analysis, Productivity, Maintenance costs, Water supply, Depreciation.

Financial data and operations are reported for 23 selected small water utilities. Data are given for a 10 year period for support services, acquisition, treatment, delivery, chemicals, payroll, and power. These data are analyzed in Volume I in which depreciation expense is examined for each of the above as to its relative capital intensiveness. To allow for comparisons between utilities the amount of revenue-producing water is used in all calculations. Cost analyses show that distribution remains the most significant cost component. Labor costs, a major part of total operational and maintenance costs, have more than doubled in many cases for the period studied. Labor costs and productivity are mathematically related to capital productivity and costs to examine the cost impact of increased output in terms of payroll and captial expenditures. Inflation effects are also analyzed in Volume I for the utility budgets. A cost analysis summary for the last year of record is given for 23 utilities. Brief Descriptions of the individual utilities are given including location, operation, and a schematic diagram of the system used. Extensive printouts of data for each utility are included. (Seigler-IPA)

6D. Water Demand

BETTER UTILIZATION OF GROUND WATER IN THE PIEDMONT AND MOUNTAIN REGION OF THE SOUTHEAST,
Geological Survey, Raleigh, NC. Water Resources Div.
R. C. Heath.
In: Water Conservation and Alternative Water Supplies--Proceedings of a Southeast Regional Conference, November 8-9, 1978, Georgia Institute of Technology, p 145-160, 1979. 10 Fig, 4 Ref.

Descriptors: *Water utilization, *Groundwater, *Southeast U.S., *Water supply, Surface waters, Water demand, Projections, Planning, Groundwater resources, Domestic water, Wells, Cities, Municipal water, Industrial water, Reservoir silting, Water requirements, Water table, Bedrock, Precipitation(Atmospheric), *Piedmont region, *Blue Ridge Mountain region.

Ground water in the Piedmont and mountain region of the Southeast, United States, is widely used for rural domestic, small municipal, and industrial water supplies. Surface reservoirs are the primary source of water for large cities and industries. Water use is expected to triple in the next 40 years and during this period many of the best reservoir sites will be occupied by cities, industries, and other high-cost developments and the yield of existing reservoirs will be reduced by sedimentation. Meeting the water needs of the region will require intensive development of ground water to supplement supplies from reservoirs. (See also W80-00001) (Kosco-USGS)
W80-03327

AN ANALYSIS OF WATER RESOURCES CONSTRAINTS ON POWER PLANT SITING IN THE MID-ATLANTIC STATES,
National Center for the Analysis of Energy Systems, Upton, NY.
B. F. Hobbs, and P. M. Meier.
Water Resources Bulletin, Vol 15, No 6, p 1666-1676, December 1979. 3 Fig, 2 Tab, 21 Ref. DOE EY-76-C-02-0016.

Descriptors: *Water resources, *Water demand, *Powerplants, *Cooling water, *Northeast U.S., Model studies, Mathematical models, Water requirements, Water users, Evaporation, Consumptive use, Low flow, Low-flow augmentation, Water pollution, Thermal pollution, Environment, Environmental effects, Electric power, Electric power industry, *Mid-Atlantic states.

Expansion of the electrical generation system in the Pennsylvania-Jersey-Maryland power pool will impact, and be constrained by, inland water availability. Future interpretations of the Federal Water Pollution Control Act Amendments of 1972 regarding evaporative cooling towers for coastal power plants, offshore siting and energy centers, and the policies and public acceptability of low flow augmentation reservoirs were some of the issues examined in this paper using scenarios generated by the Brookhaven National Laboratory Regional Energy Facility Siting Model (REFS). REFS is a multicommodity, transshipment-location, linear programming model used to allocate power plants among counties in a power pool under a minimization of cost objectives. The solutions are sensitive to the water resources assumptions in the model. For the year 2000, the amount of low flow augmentation allowed in the region's river basins and whether off-shore siting becomes a reality are the two water resources related issues which most affect the scenarios. The results showed that decisions regarding specific water problems can have region-wide implications for water- and nonwater- related issues. (Sims-ISWS)

SOCIO-ECONOMIC CHANGES AND DEVELOPMENT OF WATER RESOURCES IN SAUDI ARABIA,
King Abdulaziz Univ. Jeddah (Saudi Arabia). Dept. of Biology.
K. H. Batanouny.
In: Modeling, Identification and Control in Environmental Systems, p 935-950, North-Holland Publishing Company, 1978, 2 Fig, 7 Tab, 10 Ref.

Descriptors: *Saudi Arabia, *Water resources development, *Groundwater, *National economic development, *Water demand, *Arid lands, Regional development, Water table aquifers, Deserts, Water supply development, Oases, Desalination, Governments, Water supply, Water table, Wells.

Problems and constraints in matching Saudi Arabia's water resources needs to that country's greatly expanded level of economic development are explored. Summary reviews are given of Saudi oil production, national physical features, rainfall, groundwater resources, surface water, and city water supply. With more than 2.2 million sq km, representing about 1.5% of the land area of the earth and 5% of its arid zone, Saudi Arabia is the largest country in the world without a river, and rainfall there is too scanty in the largest portion of the country to sustain agriculture. Water scarcity is one of the country's chief constraints on national life, and water resources development accordingly has received highest government priority. Because groundwater is almost the only widespread water source (the cases of the Beduin population are supplied from groundwater sources) government attention is focused mainly on ways to sustain and improve water supply from the ground. The government has recently engaged in extensive inventorying, planning and feasibility studies in regard to groundwater supplies. In addition, a sea water desalination program began in 1965 and six desalting plants with a capacity of 12.86 million gallons/day are in operation. Finally, various water supply schemes for the country's villages have been implemented, including well-drilling and installation of motor-driven pumps. (Harris-Wisconsin)

MUNICIPAL WATER USE,
Utah Water Research Lab., Logan.
R. D. Hansen, H. H. Fullerton, and T. C. Hughes.
Utah Science, Vol 40, No 2, p 51-53, June 1979. 4 Fig, 8 Ref.

Descriptors: *Water demand, *Water utilization, *Municipal water, *Water rates, *Water consumption(Except consumptive use), Water distribution, Utah, Forecasting, Water conservation, Water loss, Optimum development plans, Semiarid climates, Water resources planning.

In the first such inventory since 1960, the water usage in 50 of Utah's largest municipal systems serving a combined population of 877,000, is described, including estimates of per capita use rates, water use determinants, and future water use rates. It is concluded that Utahns use considerably more water per capita than the national average, to some extent because of the semiarid climate and watering requirements of lawns and gardens. It is expected that increases in price and decreases in the average size of residential lots will precipitate a decrease in water usage. Municipal systems which now accept losses in their distribution systems will likely choose at some future time to reduce leakage in lieu of developing new supplies, for which reason it would appear inappropriate for planners to include a growthrate in per capita demands. (Tickes-Arizona)

OHIO RIVER BASIN STUDY--COMPREHENSIVE SURVEY: VOLUME VII-APPENDIX F, AGRICULTURE.
Army Engineer Div. Ohio River, Cincinnati.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 275, Price codes: A03 in paper copy, A01 in microfiche. Prepared by the U.S. Department of Agriculture, Soil Conservation Service, Economic Research Service, and Forest Service for the Ohio River Basin Coordinating Committee, 1966. 173 p, 44 Tab, 5 Plates.

Descriptors: *Water resources development, *Multiple purpose projects, *Water requirements, *Forestry, *Land classification, *Ohio River Basin, *Agriculture, Reservoirs, Flood control, Water demand, Recreation, Fish and wildlife, Groundwater, Water resources, Water supply, Planning, Irrigation, Water conservation, Land management, Conservation.

This is part of a larger study undertaken to provide data for comprehensive planning for the Ohio River Basin, particularly for that portion within Ohio, Indiana, West Virginia, Kentucky, Tennessee, and Illinois. The main purposes are to provide for further flood control measures and to enhance the economic well being of the Basin. This Appendix assesses the current status of agricultural resources in the Basin and provides projections for the future growth of agriculture in the region for the years 1980, 2000, and 2020. The water problems analyzed include floodwater and sediment damage to crops, rural lands and urban areas; impaired drainage of agricultural lands; agricultural drought problems and irrigation requirements; and water needs for livestock and other uses. The report includes a general description of the agricultural resource base and the agricultural economy. Demands for water and related land resource development are presented, including flood prevention, recreation, fish and wildlife, and water supply. The present status of water and related land resources is discussed and a discussion of water availability in upstream areas is presented. Specific needs and problems are discussed. Conclusions indicate that agricultural lands are available to meet expected demands to 2000; multiple use of lands should be increased; water yields are adequate for farm and rural use; proper land management is essential for conservation; production and sediment reduction; more reservoirs should be constructed and better water quality control should be exercised in upstream areas; and greater flood protection measures will also be needed. Available from the National Technical Information Service, Springfield, VA 22161 as AD-A041 270, Price codes: A07 in paper copy, A01 in microfiche. Prepared for the Ohio River Basin Coordinating Committee, August 1969. 147 p, 4 Tab, 1 Chart, 1 Attachment.

Descriptors: *Water resources development, *Ohio River, *Water supply development, *River basin development, *Multiple purpose projects, *Water resources planning, Framework studies, U.S. Water Resources Council, Legislation, Floods, Water management(Administrative), Regional development, Water policy, Water resources, Water requirements.

This is part of a larger study undertaken to provide a data base for comprehensive planning for the Ohio River Basin System, particularly within Ohio, Indiana, West Virginia, Kentucky, Tennessee, and Illinois. The main purposes are to provide for further flood control measures and to enhance economic well being of the Basin through water resource development. This Appendix details the history of the study, the authority under which it was established, and the policies and procedures followed. In planning and coordinating the study schedule, the Performance Evaluation and Review Technique (PERT) was employed. A Coordinating Committee consisting of representatives from seven federal agencies and each of the 11 states in the basin was established. Its principal functions were to provide a basis for full and continuing exchange of views; to advise and assist all participating agencies with regard to their objectives, work assignments and schedules; to assist in resolution of study problems as they arose; and to make periodic reviews of progress. Summaries are presented of each of the 15 meetings--which included public input--held by the Committee. Reviews are presented of federal and non-federal water and related land resource development programs which were presented for that portion of the basin in which the meeting was held. Study progress was reported at each meeting and any new information relating to the study was presented. Observer questions and comments were solicited at the end of each meeting. The Water Resources Council Guidelines for Framework Studies are included as an appendix to this volume. (Arnold-NC)

6E. Water Law and Institutions

WILD RIVER INVENTORY,
Heritage Conservation and Recreation Service, Philadelphia, PA.
J. G. Eugster.
Water Spectrum, Vol 12, No 1, p 28-37, Winter 1979, 13 Fig.

Descriptors: *Northeast U.S., *Rivers, *River Basin Development, *Wild Rivers, *Preservation Watershed management, Conservation, Water conservation, Water resources development, Protection, Land use, Watersheds(Basins), Regions, Topography, Water pollution control, River systems, Potomac River, Delaware River, Wild River Act, Scenery, Water policy.

A 13-state, Maine to Virginia, inventory of the Northeast was conducted to identify rivers for potential inclusion in the National Wild and Scenic Rivers System (NWSRS). The inventory, begun in 1975, identified more than 5300 miles along 171 rivers that are in relatively natural condition and merit some type of protection, conservation, or preservation measures. Similar evaluations were made in the Southeast and Lake Central Regions. For inclusion in NWSRS a river must be free-flowing, free of certain types of alterations, be largely undeveloped, and be adjacent to a related land area that possesses multi-state or national significance. Categories of information inventoried and evaluated include descriptive, geological-ecological, wilderness, scenic, cultural, and recreation. Most rivers identified are in the northern and southern extremes of the Northeast Planning Region (Virginia, West Virginia, and Maine) away from major urban areas. However, more than 9% of the river miles identifired are within 50 miles of cities of 50,000 or more. The rivers are identified by state and physiographic section. Eighty-five percent of the rivers identified are medium-to-small-sized. Of the large rivers only about 825 miles of the Potomac, Penobscot, Delaware, and St. Croix Rivers were identified. The Northeast has the smallest number of rivers in the NWSRS compared to all other areas in the continental U.S. Already in the system are portions of the Delaware and Allagash Rivers. Major benefits of the inventory are listed including: making information available, identifying preservation opportunities, and building a communications network. (Seigler-IPA)

GROUNDWATER RIGHTS IN VERMONT: DRINKWINE V. STATE,
J. P. Sahl.
Vermont Law Review, Vol 4, No 1, p 189-202, Spring 1979.

Descriptors: *Vermont, *Groundwater availability, *Absolute ownership doctrine, Groundwater, Groundwater resources, Judicial decisions, Prior appropriation, Reasonable use, Correlative rights, Water management(Applied).

The state of Vermont follows the absolute ownership doctrine of groundwater allocation. This means a surface owner has virtually unrestricted ownership and use of groundwater beneath his property. The doctrine, and the Vermont Supreme Court's recent reaffirmation of it are the subject of this commentary. The historical development of absolute ownership is reviewed, and the alternative doctrines of reasonable use, prior appropriation and correlative rights are considered. Modern developments in hydrology have significantly undermined the rationale for adherence to the absolute ownership rule because the movement and quantity of groundwater is now ascertainable. Every state, except Vermont, that follows the absolute ownership rule has modified it to exclude waste and malicious diversion. Pollution and depletion of groundwater supplies are other problems inadequately handled today by the absolute ownership doctrine. The correlative rights doctrine is the favored alternative. In addition, comprehensive legislation and a strong administrative agency is advocated as the best approach to solving water problems in general and groundwater problems in particular. (MacGregor-Florida)

WATER RESOURCES COMMITTEE (ANNUAL REPORT): SURVEY OF WYOMING WATER LAW 1975-78.
American Bar Association, Washington, DC.
Natural Resources Lawyer, Vol 12, No 1, p 311-326, 1979.

Descriptors: *Wyoming, *Judicial decisions, *Legislation, *Administrative decisions, Dams, Water rights, Appropriation, Water transfers, Irrigation, Groundwater, Water law.

The most significant Wyoming water law passed in 1975 was the law creating the Wyoming Water Development Program. This statute establishes procedures whereby the state can actively become involved in the construction and operation of water development projects. An important session law in 1976 authorized the appropriation of $250,000 to the attorney general for maintaining Wyoming's rights to the state's waters. Numerous session laws were paned in 1977 dealing with the determination of water rights, appropriation, water projects, plant siting and dam inspection. In 1978, the legislature authorized the Department of Economic Planning and Development to proceed with the construction of a well supply and water transmission project. The judicial activity in Wyoming is also reviewed. The Supreme Court held that owners of reservoirs are not subject to absolute liability for damage done by escaping water. These

were several major decisions by administrative boards. A change from irrigation use to steam power plant use was approved. Another change in appropriations from irrigation to preferred industrial use was granted. Groundwater storage by the Conservation District was also approved. (Quarles-Florida)

FLOODPLAIN AND WETLANDS MANAGEMENT (FINAL RULE).
National Aeronautics and Space Administration, Washington, DC.
Federal Register, Vol 44, No 3, p 1089-1092, January 4, 1979.

Descriptors: *Floodplains, *Wetlands, *Management, Public rights, Maintenance, Regulation, Environmental control, Federal government, Permits.

This final rule provides guidelines and details procedures to the National Aeronautics and Space Administration (NASA) headquarters and field installations for the uniform implementation of Executive Order 11988, Floodplain Management, and Executive Order 11990, Protection of Wetlands. NASA has a limited scope of activities in floodplain and wetland areas, the latter being subject to management by the United States Fish and Wildlife Service. The rule encompasses the responsibility of NASA officials, general implementation requirements and procedures for evaluating NASA actions impacting floodplains and wetlands. The rule is intended to assure: (1) that harm to lives, property and floodplain values is properly minimized; (2) that applicants for facilities use permits and grants evaluate the effect of their proposals on floodplains and wetlands prior to NASA approval; and (3) that proper restrictions are placed on property proposed for lease, easement and disposal to non-federal public or private parties. The rule defines and expands the public audience and ensures their continuous involvement in floodplain decision-making. (Corey-Florida)
W80-03406

PUBLIC USE OF WATER RESOURCES DEVELOPMENT PROJECTS ADMINISTERED BY THE CHIEF OF ENGINEERS (FINAL RULE).
Corps of Engineers, Washington, DC.
Federal Register, Vol 44, No 47, p 12671-12679, March 8, 1979. 2 Append.

Descriptors: *Water resources development, *Public access, *Recreation, Water resources, Regulation, Swimming, Camping, Hunting, Fishing, Trapping, Lakes.

The Department of the Army, acting through the Chief of Engineers, published more effective management of Corps of Engineers water resource development projects. The purpose of these rules is to clarify and strengthen existing rules and regulations and eliminate duplication of regulations. Part 327 of the final rule governs public use of water resource development administered by the chief of engineers. These regulations cover the following items as well as others: policy; vehicles, vessels; swimming; camping; hunting; fishing; trapping sanitation; fires; restrictions; explosives, firearms, other weapons and fireworks; abandonment of personal property; advertisements; outgranted lands; recreation use fees; and lakeshore management of Civil Works Projects. These regulations apply to water resource development projects completed or under construction, administered by the Chief of Engineers, and to those portions of jointly administered projects under the administrative jurisdiction of the Chief of Engineers. (Walker-Florida)
W80-03407

CONSISTENCY FOR DEPARTMENT OF THE INTERIOR OUTER CONTINENTAL SHELF (OCS) PRELEASE SALE ACTIVITIES AND FOR OTHER FEDERAL ACTIVITIES DIRECTLY AFFECTING THE COASTAL ZONE (FINAL RULE).
National Oceanic and Atmospheric Administration, Washington, DC.
Federal Register, Vol 44, No 123, p 37142-37161, June 25, 1979.

Descriptors: *Continental shelf, *Management, *Coasts, Public rights, Leases, Federal jurisdiction, State jurisdiction, Permits, Regulation, Environmental control.

This final rule amends existing regulations to conform with the April 20, 1979 United States Justice Department opinion. This opinion concluded that the Department of the Interior's Outer Continental Shelf (OCS) prelease sale activities which directly affect the coastal zone must be undertaken in a manner consistent, to the maximum extent practicable, with the requirements of approved coastal management programs in accordance with Section 307(c)(1) of the Coastal Zone Management Act (CZMA), as amended. The opinion further provided that the phrase 'directly affecting' in Secton 307(c)(1) of the CZMA, which specifically applies to OCS prelease sale activities, should be included in the regulations, instead of using present language such as 'significantly' affecting the coastal zone in terms of 'primary', 'secondary', and 'cumulative' impacts. The amendments to the regulations also include minor editorial modifications and corrections and became effective June 25, 1979. (Corey-Florida)
W80-03408

PROCEDURAL CONSIDERATIONS IN THE JUDICIAL DETERMINATION OF WATER DISPUTES,
T. Toner.
Land and Water Law Review, Vol 8, No 2, p 513-535, 1973.

Descriptors: *Water rights, *Wyoming, *Judicial decisions, Appropriation, Remedies, Jurisdiction, Water law, Water allocation(Policy), Water policy, Legal aspects.

An appropriative water right is an exclusive right to use water appropriated according to the law and applied to a beneficial use. Suits to protect these rights have taken many different forms in Wyoming: (1) actions seeking quiet title relief; (2) declaratory judgments; (3) damages; (4) injunctions to prevent wrongful diversions; (5) writs of mandamus; and (6) mandatory and preventive injunctions against water officials. Of course, relief requested by some plaintiffs includes a combination of these different remedies. Procedural problems relating to jurisdiction, parties, pleadings, and forms of relief which arise in water disputes are examined. For jurisdiction, the issues of power, competence and venue, and primary jurisdiction are considered. Considered as parties to suits are water officials and water distribution agencies. The unigue nature of an appropriative water right causes a number of procedural problems, when a suit to protect such rights is forced into forms of action designed to protect different kinds of rights and property. (Walker-Florida)
W80-03411

U.S. CORPORATE RESPONSE TO ENVIRONMENTAL OBJECTIVES,
Environmental Protection Agency, Chicago, IL. Enforcement Div.
J. O. McDonald.
Earth Law Journal, Vol 3, Issues 1-4, p 156-163, 1977.

Descriptors: *Federal Water Pollution Control Act, *Water quality standards, *Water pollution control, Permits, Legislation, Environment, Effluents, Penalties(Legal).

The major problem with past pollution legislation has been lack of specificity. The 1972 Federal Water Pollution Control Act Amendments were badly needed. They have far reaching results for industry, government and the public. The National Pollutant Discharge Elimination System (NPDES) program is a major new source of regulation. This is a permit program based on effluent requirements. Schedules for control of effluent are also included. The program calls for state-federal implementation and enforcement. The permit is treated as if it were a contract. The past laissez-faire arrangement between polluters and administrators is gone. Penalties include fines of $25,000 per day and one year in jail for the first offense and $50,000 in fines and two years in jail for subsequent offenses. A major effort is needed to increase public awareness of pollution control and clean-up legislation. These amendments may accomplish this, as they provide for citizen suits and the awarding of court costs and attorney fees to either side. (Walker-Florida)
W80-03412

WATER RESOURCES COMMITTEE REPORT ON WATER LAW DEVELOPMENTS,
American Bar Association, Washington, DC.
Natural Resources Lawyer, Vol 6, No 3, p 439-471, Summer 1973.

Descriptors: *Water law, *Administration, *Legislation, *Judicial decisions, State governments, Legal aspects, Water policy, Water management(Applied), Water rights, Watercourses(Legal aspects).

Summarized are significant developments in the field of water law and water administration in the United States for the period from August 15, 1972 to March 15, 1973. The information is presented on a state by state basis. Each summary pertains to legislative, judicial and administrative matters, as appropriate. The information was prepared by a Water Resources Committee member designated in each state. States for which there was no significant developments within the time period include: New Hampshire, Arizona, Wisconsin, North Carolina, North Dakota, Oregon, New Mexico and New York. (Walker-Florida)
W80-03413

UNITED STATES OCEAN MINERAL RESOURCE INTERESTS AND THE UNITED NATIONS CONFERENCE ON THE LAW OF THE SEA,
Department of the Interior, Washington, DC. Office of the Assistant Secretary for Energy and Minerals.
L. S. Ratiner, and R. L. Wright.
Natural Resources Lawyer, Vol 6, No 1, p 1-43, Winter 1973.

Descriptors: *Law of the Sea, *Resources development, *International waters, Mining, Oil, Mineral industry, Industries, Legislation, United Nations, United States.

An overview is presented of the challenges facing negotiators at the third United Nations Conference (Conference) on the Law of the Sea. Reference is made to previous conferences and their results. Major emphasis is placed on the effect that the third conference is likely to have on the distribution of ocean mineral resources. This problem is divided into the two categories of petroleum and hard minerals. For each of these resources the following are considered: (1) U.S. interest in the resource; (2) U.S. position; (3) other countries' interests in the resource; and (4) progress of the negotiations. Until a final treaty is adopted, the mining industry suggests that interim deep sea mining legislation be passed. The industry's arguments are: (1) The United States (U.S.) should develop a politically secure source of important metals; (2) Ocean mining will lead to new important technology; (3) Deep sea mining will improve U.S. balance of payments; (4) Treaty negotiations are slow and unlikely to produce reasonable results; (5) The U.S. is using deep sea mining as a trading coin to achieve other objectives in the conference; and (6) Deep sea interim legislation will help achieve an international regime and organization. (Walker-Florida)
W80-03415

THE NATIONAL ESTUARINE SANCTUARY PROGRAM,
National Oceanic and Atmospheric Administration, Washington, DC.
J. W. Mac Farland, and R. S. Weinstein.
Coastal Zone Management Journal, Vol 6, No 1, p 89-97, 1979. 12 Ref, 1 Append.

Descriptors: *Estuarine environment, *Marsh management, *Coastal marshes, Coasts, Estuaries, Ecosystems, Federal government, Management, Environmental effects, Grants.

In the 1972 Coastal Zone Management Act Congress established the Estuarine Sanctuary Program. This program arose in response to two government studies showing that estuaries are economically and ecologically valuable to man and in danger of being physically altered and polluted. The program makes available a fifty-percent matching grant to coastal states to help them set aside estuarine areas for research and education. The information gained within these areas will aid in future management decisions concerning the coastal zone. The sanctuaries are established and operated under the Estuarine Sanctuary Guidelines. Grants are available for preacquisition, acquisition, and operations. Presently, there are five sanctuaries in operation, with others in the planning stage. The five established sanctuaries are in South Slough, Oregon, Sapelo Island, Georgia, Wainance Hawaii; Old Woman Creek, Ohio; and Rookery Bay, Florida. Proposed sites are in Apalachicola Bay/River, Florida and Elkhorn Slough, California. A reference list is included. (Walker-Florida)
W80-03416

ADVERSE EFFECTS OF RECREATION ON SAND DUNES: A PROBLEM FOR COASTAL ZONE MANAGEMENT,
Environmental Research Associates, Seattle, WA.
G. Vogt.
Coastal Zone Management Journal, Vol 6, No p 37-68, 1979. 3 Fig, 60 Ref.

Descriptors: *Dune sands, *Recreation demand, *Carrying capacity, Coasts, Management, Dunes, Environmental effects, Land use, Shores, Coastal structures.

The conflict between two goals of coastal zone management are dealt with: preservation of and increased access to the shoreline for recreation purposes. Foot traffic and off-road vehicles are examples of recreational activities which can harm dune areas. The concepts of ecological and perceptual carrying capacity are discussed. The former deals with the environment's assimilative capability, while the latter focuses on the recreationist's perception of environmental quality. Coastal zone management policies of certain federal, state and local government entities are examined. Attention is focused on state regulations in California and Oregon with local coastal management programs in Washington state receiving mention. A two-stage methodology is proposed to aid in decision-making on the local governmental level. In the first stage, a decision must be made as to whether increasing access to the coastal zone for recreation is more or less important than protecting the coastal resource. Decision stage two deals with how the coastal resource is allocated to different recreation uses and what management tools can be used in making allocation decisions. An implementation scenario is also proposed. (Walker-Florida)
W80-03417

DEVELOPING MANAGEMENT GUIDELINES FOR OIL AND GAS ACTIVITIES: THE LOUISIANA EXPERIENCE,
Louisiana State Univ., Baton Rouge.
J. H. Stone, L. M. Bahr, Jr., J. W. Day, Jr., R. E. Turner, and P. H. Templet.
Coastal Zone Management Journal, Vol 6, No 1, p 9-35, 1979. 1 Fig, 1 Tab, 30 Ref.

Descriptors: *Louisiana, *Water pollution control, *Resources development, Management, Oil industry, Coasts, Natural gas, Environmental effects, Estimating benefits, Estimating costs.

Preliminary management guidelines have been derived for oil and gas activities in coastal Louisiana. Passage of the federal Coastal Zone Management Act resulted in a planning program to develop a Coastal Zone Management Plan for Louisiana. A general premise was that all economic activities should be designed to complement natural functions as much as possible. The process by which the guidelines for the oil and gas industry were established is analyzed. A step-by-step method is described as follows: (1) agree that there are environmental impacts; (2) estimate the extent of the impacts; (3) establish guidelines to deal with the impacts; (4) solve technical problems associated with guidelines; (5) transfer and implement procedures or guidelines; and (6) enforce the guidelines. Included with this process analysis is a discussion of the implications for coastal zone management. A series of tables outlines the coastline impacts of activities relating to oil and gas exploration, construction, production and ancillary development. Guidelines are listed to reduce these impacts and their unknown effects. (Walker-Florida)
W80-03418

NATIONALIZING LAKE TAHOE.
Santa Clara Law Review, Vol 19, No 3, p 681-717, Summer 1979.

Descriptors: *Federal government, *Land management, *California, *Nevada, Administrative agencies, Basins, Urbanization, Planning, State governments, Land use, Recreation.

As a result of urbanization in the Northern California and Northwestern Nevada area, concern arose for the preservation of the Lake Tahoe Basin area as a beautiful recreation attraction. In response to this concern, a planning board, the Tahoe Regional Planning Agency (TRPA), was created pursuant to an agreement between California and Nevada with Congressional approval. Recently, the TRPA's effectiveness has been questioned. Any resolution of the problem has been stymied due to the disagreement between the two states' legislatures. Federal intervention has been threatened to resolve the dispute. Various methods of federal intervention are examined. The creation of a national recreation area is stressed with the imposition of federal land use controls as a means to protect the basin, in the absence of effective state land management controls. There is a wealth of federal power available to affect the area's growth. Apparently, Congress has the constitutional power to impose direct federal land use control to protect any federal land. At the very least, a congressional declaration of the national interest in Lake Tahoe should be made. (Quarles-Florida)
W80-03419

SOUTH DAKOTA GROUND WATER AND THE ARTESIAN PRESSURE: IS THE USE OF WATER FOR DOMESTIC PURPOSES STILL THE HIGHEST USE.,
G. L. Peterson.
South Dakota Law Review, Vol 24, No 3, p 772-794, Summer 1979.

Descriptors: *South Dakota, *Domestic water, *Artesian wells, Constitutional law, Groundwater availability, Compensation, Water law, Groundwater resources, Water demand.

Before 1972 it was South Dakota's policy to protect the artesian pressure as a means of diversion of ground waters. A 1972 amendment to the state's water law changed this policy. As a result of a priority dispute over the use of the artesian pressure, the amended statute tips the balance in favor of the large-scale user and away from the domestic user. The framework of a constitutional challenge is analyzed. The assertion is that valuable property rights to the beneficial use of the water have been taken without compensation. An examination of alternative theories that a domestic user may argue in asserting his right to the artesian pressure is also presented. Common law theories such as nuisance and negligence may be argued, but a more feasible approach would be to advocate a statutory change. Domestic wells should be regulated to phase out 'freeloading', archaic wells. A statutory definition of adequacy more common to the average layman should be provided, taking into account existing wells and the state of development in the area. (Walker-Florida)
W80-03420

THE GROWING NEED FOR FEDERAL-STATE COOPERATION IN MANAGING THE SEA,
Marine Mammal Commission, Washington, DC.
D. Laist, and J. Epting.
Coastal Zone Management Journal, Vol 6, No 1, p 1-7, 1979.

Descriptors: *State governments, *Oceans, *Regulation, *Governmental interrelations, Submerged Lands Act, Coasts, Jurisdiction, Water resources, Coordination, Management.

As the number of federal marine management programs and authorities proliferates, at least two concerns become immediately apparent. First, the separate pieces of enabling legislation for these programs do not combine into a cohesive whole. They are a series of piecemeal initiatives each defining a specific, though often overlapping, marine mission. This creates the problems of inefficient work and bureaucratic tracking of progress within other programs. Several studies are referred to which investigate the need for a more comprehensive and integrated national ocean management system. The second concern is the recognition of the current and essential state role in marine management. This arises because the three-mile limit controlled by the states contains a major segment of the overall marine resources. The states also control the condition of the environmentally sensitive estuarine and near-shore environments. The states have been given broad federal mandates under the Submerged Lands Act and the Coastal Zone Management Act. For these reasons, a more viable state role in marine management is advocated. (Walker-Florida)
W80-03421

SAFEGUARDS FOR GROUNDWATER,
J. Josephson.
Environmental Science and Technology, Vol 14, No 1, p 38-44, January, 1980. 2 Fig.

Descriptors: *Water pollution control, *Ground water, *Regulations, Landfills, Injection wells, Impoundments, Pollutants, Wastes, Monitoring, Sampling, Attenuation.

Approximately 50% of the U.S. population depends upon ground water. Due to its slow movement and lack of oxygen, ground water tends to be a contaminant preservation medium. Contaminant mobility depends upon oxidation-reduction potentials, complementary ions, and the presence of clays. Contaminants can be contained or intercepted by pumping but this will require treatment of pumped ground water or discharge of untreated ground water. The best approach to ground water protection would be to prevent contamination due to improper land-filling, underground injection, and surface impounding of hazardous wastes. The EPA acting under the Safe Drinking Water Act of 1974 (SDWA) and the Resource Conservation and Recovery Act of 1976 (RCRA) will enforce strict regulations governing disposal of wastes. This will affect 275,000 waste generators, 30,000 facilities, and about 10,000 waste transporters. In addition there will be rules, guidelines and recommendations for monitoring ground water. For example, sampling must avoid contact with atmospheric air and the monitoring/sampling equipment should not react with the suspected contaminants. Analyses performed by an EPA-certified laboratory would have greater credibility in a dispute. (Purdin-NWWA)

DAM SAFETY: THE CRITICAL IMPERATIVE,
Western New England Coll., Springfield, MA.
D. Binder.
Land and Water Law Review, Vol 14, No 2, p 341-392, 1979.

Descriptors: *Dam failure, *Safety factors, *Dam construction, Dams, Governmental interpretation, Federal-State-Water rights conflicts, Legislation, Administrative agencies, Interstate rivers, Dam sites, Inspection.

The Carter administration is conducting a major reappraisal of Western water policy. A crucial area of consideration will be dam safety. The spectacular Teton dam break has been the most dramatic example of the seriousness of the dam safety problem. It was, however, only the culmination of a series of breaks and near-misses which have swept away congressional inaction. The result has been the Federal Dam Safety Inspection Act. This Act, proposed model codes, and existing state regulation are examined. The Teton disaster, its causes and lessons are also examined. States must enforce minimum safety and inspection standards. Present state programs are grossly inadequate. Because dams involve interstate waters and the present state regulations are inadequate a federal agency is proposed. (Mac Gregor-Florida)

THE THIRD UNITED NATIONS CONFERENCE ON THE LAW OF THE SEA: THE SEVENTH SESSION (1978),
Miami Univ., FL. School of Law.
B. H. Oxman.
American Journal of International Law, Vol 73, No 1, p 1-41, January 1979.

Descriptors: *International law, *Law of the sea, *United Nations, *International waters, United States, Water law, Negotiations, Continental shelf, Oceans, Treaties.

The seventh session of the Third United Nations Conference on the Law of the Sea met in Geneva and New York during 1978. Most of the Informal Composite Negotiating Text (ICNT), except for part XI relating to deep seabed mining, survived review without further amendments. Aside from the deep seabed issues, there was no general disagreement on basic substantive questions. The United States along with other potential seabed mining countries rejected Part XI of the ICNT. Seven negotiating groups on outstanding issues were appointed at the session. Three groups dealt with deep seabed matters: the first, with the system of exploration and exploitation and resource policy; the second, with financial arrangements; and the third, with organs of the Seabed Authority. The fourth negotiating group dealt with access to living resources of the economic zone by landlocked states. The fifth group dealt with the settlement of disputes over fisheries in the economic zone. The sixth group attempted to define the outer limits of the continental shelf. The final group examined the delimitation of maritime boundaries between adjacent and opposite states and the settlement of delimitation disputes. (Quarles-Florida)

TIDELANDS AND THE PUBLIC TRUST: AN APPLICATION FOR SOUTH CAROLINA,
B. W. Wyche.
Ecology Law Quarterly, Vol 7, p 137-170, 1978.

Descriptors: *Tidal marshes, *South Carolina, *Court decisions, Wetlands, Land use, Marshes, Judicial decisions, Public rights, Water law.

Courts have generally applied the public trust doctrine to tidelands. Under the doctrine, tidelands, as well as lands underlying navigable, non-tidal waters, are held in trust for the benefit of the public. The owner is deemed to hold his title subject to the paramount rights of the public in the lands. In State v. Hardee (South Carolina), Justice Bussey of the South Carolina Supreme Court concurred with the result reached in the majority decision, but concluded in a separate opinion that only submerged lands are held in the public trust; the tidelands are merely 'vacant lots subject to grant and private ownership as any other vacant lands'. The main purpose of this article is to re-examine the conclusions drawn by Justice Bussey and others. By analyzing the common law, South Carolina statutory and case law, and the law in other jurisdictions, this article seeks to demonstrate that a tidelands trust does exist in the state. (Steiner-Mass)
W80-03526

INTEGRATED PLANNING FOR WATER QUALITY MANAGEMENT: THE FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972 AND COASTAL ZONE MANAGEMENT,
Cornell Univ., Ithaca, NY. Dept. of City and Regional Planning.
W. K. Allayaud.
January 1979. 217 p, 55 Ref.

Descriptors: *Coastal zone management, *Federal Water Pollution Control Act Amendments, *Water quality, *Federal Coastal Zone Management Act, *Planning, *Water quality control, *Governmental interrelations, Management, Implementation, Land planning, Water management(Applied), Water permits, Water resources planning, Legislation.

The Federal Water Pollution Control Act Amendments were enacted by Congress in response to the severe water quality problems being faced by the nation. In addition to creating a permit system for dischargers and ordering grants for construction of sewage treatment plants, the Amendments place planning in a crucial role in the long-term effort to clean our waters. Section 208 of the Amendments establishes regional planning for water quality management as being necessary and provides strong incentives for states and municipalities to implement the Section's requirements. The Federal Coastal Zone Management Act of 1972 acknowledges the need to relate air, land and water planning in the coastal zones and gives the states the lead in order to provide comprehensive, coordinated management of coastal areas. These two processes--Section 208 and the Coastal Zone Management Act (CSMA)--need to be coordinated during implementation and the final planning outputs need to be integrated. There are five issues which relate to this integration. The first two issues on land and water planning integration and the role of different government levels are more general. The other three issues--coordination and integration of planning processes, sewage disposal in the coastal zone, and the 208 plan--deal more specifically with how the two planning processes come together. The author recommends that the states should play the lead role in the integration of water and land planning and they should also assume a stronger role in the system of federalism for resource management. Another major recommendation is that a final decision on ocean disposal of sewage should be postponed while continued planning helps to clarify the situation. Two case studies are presented. (Iervolino-NC)

THE CANADA WATER ACT ANNUAL REPORT, 1978-1979.
Department of the Environment, Ottawa (Ontario).
1979. 32 p.

Descriptors: *Water quality, *Water management(Administrative), *Flood damage reduction, *Basin studies, *Canada Water Act, *Water resources, *Water policy, *Legislation, Governments, Flood plain management, Basins, Nutrient loading, Watershed management, Hydrologic data, Flood-risk mapping, Flood protection, Monitoring, Flood damage, Water resources planning.

This is the seventh annual report covering operations to March 31, 1979. It outlines provisions of the 1970 Canada Water Act and discusses various government programs designed to carry out those provisions. Comprehensive water resource management included five major programs begun in 197m-1978 and implemented throughout 1978-1979. The flood damage reduction program identifies flood risks and potential damage in flood-prone areas, partially through an ongoing flood risk mapping effort. Construction activities included a dyking program in Southwestern Ontario and the Okanagan Flood Control Channel in British Columbia. Research activities pursuant to the Canada-Ontario Agreement on Great Lakes Water Quality also continued. The number of detected violations of nutrient loading limitations have declined since 1973. Public information programs included shoreline protection/flood hazard manuals, new data in the 1979 Canada Water Year Book, and television broadcasts on the flood damage reduction program. A description of the recent drought in Western Canada is presented. Eight implementation agreements on conducting of water basin agreements were reached and seven planning studies begun. (Arnold-NC)

WATERFOWL PAIR USE OF NATURAL AND MAN-MADE WETLANDS IN SOUTH DAKOTA,
South Dakota State Univ., Brookings. Dept of Wildlife and Fisheries.
J. J. Ruwaldt, Jr., L. D. Flake, and J. M. Gates.
Journal of Wildlife Management, Vol 43, No 2, p 375-383, April, 1979. 5 Tab, 22 Ref. OWRT A-038-SDAK(2), B-045-SDAK(2).

Descriptors: *Waterfowl, *Breeding, *Grasslands, *Potholes, Water levels, Water fluctuation, Blue-winged teal, Pintail ducks, Shoveler duck, Ponding, Wetlands, Freshwater marshes, Ecology, Ponds, Lakes, *South Dakota.

Prairie ponds and lakes, primarily of glacial origin, comprised 75 and 68%, respectively, of the total area and number of wetlands in South Dakota. Stock ponds comprised 14% of the area and 21% of the wetlands, and dugouts 1% and 12% of the wetland area and numbers, respectively. Semipermanent wetlands and stock ponds contained proportionally more pairs of most species than other wetland categories. Ephemeral, temporary, and seasonal wetlands were also heavily utilized by pairs, but contained smaller proportions of total pairs than semipermanent wetlands because of smaller surface water area. Permanent lakes received relatively low use in relation to surface water area. Ephemeral, temporary, and seasonal wetlands were part of a wetland complex utilized by Anatini. For several species of Anatini, loss of a portion of that complex as a result of drought apparently caused reduced pair use of the remaining semipermanent wetlands as well as stock ponds and dugouts. THE EFFECTS OF WATERFOWL MANAGEMENT PRACTICES ON MOSQUITO ABUNDANCE AND DISTRIBUTION IN LOUISIANA COASTAL MARSHES,
Louisiana State Univ., Baton Rouge.
S. C. Fleetwood, C. D. Steelman, and P. E. Schilling.
Mosquito News, Vol 38, No 1, p 105-111, March, 1978. 2 Fig, 3 Tab, 12 Ref.

Descriptors: *Salt marshes, *Marsh management, *Waterfowl, *Environmental effects, *Mosquitoes, Impoundments, Ecological distribution, Life history studies, Habitat, Insects, Wetlands, Wildlife management, Louisiana, Ecology.

Waterfowl management practices utilized in intermediate and brackish marsh impoundments produce significantly (P less than 0.01) more mosquitoes than practices utilized in marsh pump-outs or natural salt marsh in Louisiana. During the time that the impoundments were flooded, the intermediate marsh impoundment produced significantly (P less than 0.01) larger numbers of mosquitoes than the brackish marsh impoundment. Culex salinarius preferred the intermediate marsh impoundment. Anopheles bradleyi preferred the brackish marsh impoundment. During the time that the impoundments were drained (May through September), Aedes sollicitans eggs were collected in significantly larger numbers from the intermediate marsh impoundment. ASSESSMENT OF EFFECTS OF ALTERED STREAM FLOW CHARACTERISTICS ON FISH AND WILDLIFE. PART B: CALIFORNIA, CASE STUDIES,
Jones and Stokes, Inc., Sacramento, CA.
C. Hazel, S. Herrera, H. Rectenwald, and J. Ives.
U.S. Fish and Wildlife Service, Office of Biological Service Report FWS/OBS-76/34. December, 1976. 606 p, 1 Append.

Descriptors: *California, *Wildlife habitat, *Water resources development, *Streamflow, Wildlife, Dams, Alternation of flow, Fisheries, Water resources, Fish management.

The results and conclusions are given for 47 case studies of California water projects that altered natural streamflow regimes and causally affected the fish and wildlife. Surveys were conducted on existing conditions below dams and diversions to assess the actual effects of the streamflow characteristics on fish and wildlife and to evaluate the adequacy of the methodologies used to determine necessary flows. AN AUTOMATIC RANGE-SWITCHING MODIFICATION FOR DIRECT-READING SPECIFIC CONDUCTANCE MEASUREMENTS,
Geological Survey, Denver, CO. Water Resources Div.
H. E. Taylor, and D. E. Erdmann.
Chemical, Biomedical, and Environmental Instrumentation, Vol 9, No 1, p 49-60, 1979. 4 Fig, 1 Tab, 13 Ref.

Descriptors: *Automation, *Specific conductivity, *Measurement, *Instrumentation, Analytical techniques, Water sampling, *Automatic range-switching modification, Digital electronic circuitry, Direct-reading conductivity meter.

An analysis system was developed to determine automatically specific conductance on samples at the rate of 30 per hour over a range of 1 to 15,000 micromho per centimeter with a precision of 1 percent or less. The system consists of custom-designed digital electronic circuitry which modifies a commercially available direct-reading conductivity meter. This modification permits automatic range switching of the meter so that measurements are made under optimum conditions. (Kosco-USGS)

HYDROLOGIC LAND USE CLASSIFICATION USING LANDSAT,
Hydrologic Engineering Center, Davis, CA.
R. J. Cermak, A. D. Feldman, and R. P. Webb.
Technical Paper No 67, October 1979. 24 p, 5 Fig, 3 Tab, 8 Ref.

Descriptors: *Land classification, *Remote sensing, *Hydrology, *Satellites(Artificial), Land use, Hydrologic aspects, Watersheds(Basins), Runoff, Agriculture, Vegetation, Pasture, Industries, Water, Discharge(Water), Hydrographs, LANDSAT, Residential.

This report described the Hydrologic Engineering Center's experience with land use classification from LANDSAT multispectral imagery. Land use is required for the estimation of hydrologic model parameters. The land use classification procedure used, developed at the University of California, Davis, for the Corps of Engineers, is an unsupervised, noninteractive approach requiring no special image processing equipment. Watershed land use was determined from LANDSAT digital data, entered into a geographic data bank, and compared with a conventional land use classification. Hydrologic simulation model parameters were estimated from land use and other basin characteristics. The generated discharge frequency curves, corresponding to the alternative land use classifications, permitted the hydrologic significance of accuracy in land use identification to be assessed. TV CAMERA LETS YOU LOOK DOWN A WELL,
C. Henry.
Irrigation Age, Vol 14, No 4, p 36-37, 45, January, 1980.

Descriptors: *Borehole cameras, *Irrigation wells, Logging(Recording), Photography, Remote sensing, Repairing.

Monitoring of irrigation wells with a downhole TV camera can quickly determine the cause of lost production or decreased flow and the best way to repair a well or fish for lost tools. It is also used by drillers to assure their customers that a new well was completed correctly, and by homeowners who want to convince prospective buyers that an old well is in good condition. With a black and white system a single conductor on a 1/4 in. line handles both camera and light source. The equipment can go as deep as 1700 ft. and withstand 200F water and artesian heads up to 2000 gpm. The picture transmitted from the well is a complete 360 degree view of the hole at about a 45 degree angle. A video tape of the well with a running commentary is made as the camera descends. Taping a normal well will cost between $250 and $500. (Purdin-NWWA)

DOWSING ACHIEVES NEW CREDENCE,
T. Williamson.
New Scientist, p 371-373, February 8, 1979. 1 Fig, 7 Ref.

Descriptors: *Groundwater, *Minerology, *Exploration, Magnetic studies, Geophysics, Structural geology, Remote sensing, Subsurface investigations.

A new method for mineral and ground water exploration, called the bio-physical method (BPM) in the Soviet Union or more commonly known as divining or dowsing, is being seriously investigated by some scientists. Hydrogeologists and other scientists concerned with ground water supplies have traditionally viewed water divining with distaste or hostility. This is due to the fact that most water diviners do not have even a basic understanding of ground water geology and perpetuate naive and unscientific theories about ground water and dowsing. Soviet geologists have been studying BPM for 12 years and have gotten as good or better results than obtained from geophysical methods. They theorize that the human nervous system is sensitive to very small anomalies in magnetic field strength caused by geologic discontinuities (faults, buried valleys, solution cavities, etc.). Mineral veins and ground water are often localized in such discontinuities. If the underlying principles of BPM were discovered, a simple, inexpensive water prospecting tool would be available to developing countries that depend on ground water. What is required is a thorough scientific investigation by a multidisciplinary team. (Purdin-NWWA)

A HYDROLOGICAL ANALYSIS OF EAST AUSTRALIAN FLOODS USING NIMBUS-5 ELECTRICALLY SCANNING RADIOMETER DATA,
National Aeronautics and Space Administration, Greenbelt, MD. Goddard Space Flight Center.
L. J. Allison, T. J. Schmugge, and G. Byrne.
Bulletin of the American Meteorological Society, Vol 60, No 12, p 1414-1427, December 1979. 13 Fig, 40 Ref.

Descriptors: *Rainfall, *Floods, *Australia, *Remote sensing, Satellites(Artificial), Rivers, Watersheds(Basins), Soils, Soil moisture, Microwaves, Runoff, Drainage, Hydrology, Meteorology, Microwave brightness temperatures, Scanning microwave radiometers.

The chronological development and diminution of six floods in eastern Australia during January, February, and March 1974 were mapped for the first time by the Nimbus Electrically Scanning Microwave Radiometer (ESMR). Day and nighttime ESMR (19.35 GHz) coverage was analyzed for the low gradient, flooded Darling River system in New South Wales. Apparent movement of surface water as indicated by low brightness temperatures (less than 250 K, day and less than 240 K, night) was easily followed around the curved runoff basin along the northern shoreline of the flooded Darling River during this 3-month period. This pattern was in good agreement with flood crest data at selected river height gage stations, even under cloudy conditions. (Sims-ISWS)

A DISTANT READING RAINGAUGE,
Meteorological Office, Poona (India). Instruments Div.
N. V. Iyer.
Mausam, Vol 30, No 1, p 55-58, January 1979. 4 Fig, 1 Tab, 2 Ref.

Descriptors: *Remote sensing, *Rain gages, *Rainfall, Instrumentation, Flood forecasting, Flood control, Electronic equipment, Rainfall intensity, *Rainfall counter, *Instruments, Field testing, Hydrometeorological stations, Flood warning, Sensor, Electronic counter, Rainfall rate.

A remote indicating rainfall counter was designed, constructed, and field tested in the Instruments Division of the Pune Meteorological Office. The sensor used was a conventional tipping bucket rain gage connected to a counter housed inside the observatory office. The instrument can be useful in flood forecasting offices, hydrometeorological stations, and airport meteorological offices. The total

rainfall can be read off easily on the counter and the rate of rainfall determined by using a stopwatch during heavy periods of rain. A magnet attached to the tipping bucket moves past a reed switch to make an electrical contact for each tilt of the bucket. The contacts are conveyed by cable to an electronic counter made up of integrated circuits. Light-emitting diodes display the rainfall registered by the counter. The performance of the instrument was good when some of its limiting factors--such as a 1-mm least count and time lost during tipping the bucket plus friction--were taken into consideration. (Roberts-ISWS)

TREE RINGS AS INDICATORS OF HYDROLOGIC CHANGE IN THE GREAT DISMAL SWAMP, VIRGINIA AND NORTH CAROLINA,
Geological Survey, Reston, VA. Water Resources Div.
R. L. Phipps, D. L. Ireley, and C. P. Baker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-301 385, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 78-136, 1979. 26 p, 5 Fig, 5 Tab, 17 Ref.

Descriptors: *Dendrochronology, *Hydrology, *Variability, *Swamps, Virginia, North Carolina, Model studies, Analytical techniques, Data collections, Loblolly pine trees, Sampling, Drainage, Climatic data, Regression analysis, Documentation, Precipitation(Atmospheric), Temperature, Water levels, Sites, *Great Dismal Swamp(Va-NC), Preditching, Postditching, Tree rings, Hydrologic change indicators.

Analysis of tree rings of large, canopy loblolly pines (Pinus taeda L.) growing near a drainage ditch in the Great Dismal Swamp have indicated that the tree rings are datable and hydrologically (climatically) sensitive. Climatic and prior growth factors in regression explained 87 and 71 percent of the variance of the preditching and postditching earlywood widths, respectively, and 82 and 70 percent of the latewood widths for the same time periods. Early summer precipitation was significantly, and positively correlated with preditching latewood growth. When preditching and postditching records were merged into a single record, regression analysis explained less growth variation than when the two time periods were considered individually, implying a change in growth response following ditching. Prior to ditching, growth was most limited by dry summers which followed dry summers. After ditching, growth was less strongly linked with precipitation and more strongly linked with temperature. Regression results are compatible with the contention that growing season water levels in the proximity of the collection site have been lower since ditching. (Kosco-USGS)

SOME IMPLICATIONS OF REMOTE SENSING TECHNOLOGY IN INSECT CONTROL PROGRAMS INCLUDING MOSQUITOES,
National Aeronautics and Space Administration, Houston, TX. Lyndon B. Johnson Space Center.
C. M. Barnes, and W. C. Cibula.
Mosquito News, Vol 39, No 2, p 271-282, June, 1979. 8 Fig, 16 Ref.

Descriptors: *Wetlands, *Remote sensing, *Vegetation, *Classification, Terrain analysis, Aerial photography, Photogrammetry, Research and development, Public health, Insects, Aquatic insects, Habitat.

Preliminary investigative work is described concerning the application of remote sensing technology to the classification of wetland vegetation and terrain which have implied public health and insect control significance. Initial activity concerned definition of mosquito breeding habitat using multibrand aerial photography, and multispectral sensing from aircraft. Photography is the least expensive remote sensing system yet both methods do an excellent job of defining environment and vegetative habitat. It appears feasible to utilize LANDSAT satellite imagery to classify into broad ecotypes the vegetation sometimes associated with insect development. Research has been limited to one mosquito species, but it seems likely that other species may be studied using similar techniques. (Howard-Mass)

DELINEATION OF BURIED RIVER VALLEY AQUIFERS IN DISSECTED TILL PLAINS,
Missouri Univ. Columbia. Dept. of Geology.
J. M. Sharp, Jr., M. D. Hall, M. Bahorich, and C. Keefe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-143621, Price codes: A04 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, University of Missouri Completion Report. November 1979, 51 p, 29 Fig, 24 Ref, 2 Append, OWRT A-112-MO (1), 14-34-001-9027.

Descriptors: *Subsurface mapping, *Bedrock, *Aquifers, Valleys, Glacial drift, Till, Geomorphology, Missouri, Iowa, *Buried River Valley aquifers, Gravity profile.

Several methods of gravity geophysics, in conjunction with drift thickness and bedrock topography maps, were used to map the location of buried river valleys in northwestern Missouri. Drift thickness varies from zero to over 100 metres within the selected study area. The buried valleys are often filled with thick sequences of glacial-fluvial deposits which can serve as important aquifers. Over 900 gravimeter readings established a grid network over the study area. Two methods were used to calculate the regional Bouguer free-air anomaly-poly-nomial trend surfaces of reduced gravity readings and trend surfaces defined solely by the well data. The fifth-order polynomial trend surface closely matched basement rock topography. This trend surface, along with the gravity residual and drift thickness maps, can then be used to delineate these valleys with fair accuracy. Gravity profiles were run normal to several suspected buried valleys. The gravity residual profiles showed a strong correlation to bedrock topography, where known, and to several theoretical models. Gravity profiling can be used to delineate the deepest portion of these valleys. In all cases, an adequate density contrast was observed between the drift and the bedrock. Several promising branch aquifers, previously unreported, are indicated.

USE OF SYNOGRAPHIC TECHNIQUES IN RESEARCH AND DISSEMINATION OF HYDROLOGICAL INFORMATION,
Texas Univ. at Houston. School of Public Health.
I. Cech, E. M. Davis, E. A. Gonzales, and D. Brooks.
Water Resources Bulletin, Vol 15, No 6, p 1691-1706, December 1979. 9 Fig, 11 Ref.

Descriptors: *Mapping, *Data processing, *Analytical techniques, *Urban runoff, *Water quality, Floods, Water pollution, Pollutants, Nutrients, Nitrogen, Nitrates, Phosphorus, Sodium, Chlorophyll, Bacteria, Groundwater, Estuaries, Water supply, *Houston(TX), Synographic mapping.

Application of synographic techniques to four separate nonrelated research tasks demonstrated the usefulness of such an approach in interpreting and communicating hydrologic survey data especially when large geographic areas are involved. Nutrient exchange and biotic indicators in coastal estuaries were analyzed to determine residence times in different seasons of the year. Man-induced changes in urban runoff patterns were shown to increase the probability of flooding with different recurrences of storm events. Nitrate and indicator bacteria in private wells were analyzed on a county-wide basis to determine the sources and extent of natural occurrence vs. contamination origins. Water wells and the surface supply of metropolitan Houston were analyzed for sodium content to assist citizens and physicians with data that are needed for derivation of sodium-restricted therapeutic diets. ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN CARSON COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 242, November 1979. 69 p, 18 Tab, 75 Ref, 24 Map.

Descriptors: *Groundwater resources, *Texas, *Aquifers, *Data collections, Groundwater, Maps, Water resources, Aquifer characteristics, Groundwater recharge, Water supply, Groundwater availability, Groundwater mining, Overdraft, Pumping, Projections, Saturated flow, *Carson County(TX), *Ogallala aquifer(TX), Pumping rates, Pumping lifts, Well yields.

This is one of numerous planned county studies covering the declining groundwater resource of the Ogallala aquifer in the High Plains of Texas. The report contains maps, charts, and tabulations that reflect estimates of the volume of water in storage in the Ogallala aquifer in Carson County and the projected depletion of this water supply by decade periods through the year 2020. The report also contains estimates of pumpage, pumping lifts, and other data related to current and future water use in the county. However, the report does not attempt to project that portion of the volume of water in underground storage that may be ultimately recoverable. The Ogallala aquifer in Carson County contained approximately 9.6 million acre-feet of water in 1974. Historical pumpage has exceeded 150,000 acre-feet annually, which is approximately six times the rate of natural recharge to the aquifer in the county. This overdraft is expected to continue, ultimately resulting in reduced well yields, reduced acreage irrigated, and reduced agricultural production. There is a very uneven distribution of groundwater in the county. Some areas have ample groundwater resources to support current usage through the year 2020; whereas, in other areas of the county, groundwater is currently in short supply. To obtain maximum benefits from the remaining groundwater resources, Carson County water users should implement all possible conservation measures so that the remaining groundwater supply is used in the most prudent manner possible and with the least amount of waste. (Humphreys-ISWS)

MAP SHOWING GROUND-WATER CONDITIONS IN THE BODAWAY MESA AREA, COCONINO COUNTY, ARIZONA--1977,
Geological Survey, Tucson, AZ. Water Resources Div.
C. D. Farrar.
Geological Survey open-file report 79-1488 (WRI), September 1979. 1 Sheet, 8 Ref.

Descriptors: *Groundwater resources, *Maps, *Aquifers, Water table, *Water quality, Hydrogeology, Indian reservations, Arizona, *Bodaway Mesa area(Ariz), Coconino County(Ariz), Navajo Indian Reservation(Ariz).

The Bodaway Mesa area includes about 800 square miles in north-central Arizona, and most of the area is in the Navajo Indian Reservation. Groundwater development has been slight; in 1977 the estimated ground-water withdrawal was less than 5 acre-feet. The Chinle Formation is the principal aquifer tapped by wells, and in places the Moenkopi Formation and the Redwall and Muav Limestones yield water to wells and springs. Water levels in the Chinle Formation are 15 to 200 feet below the land surface. The water from one well completed in the Petrified Forest Member of the Chinle Formation contained 1,210 milligrams per liter of dissolved solids; the dissolved-solids concentrations from two wells in the Shinarump Member of the Chinle were 1,000 and 1,110 milligrams per liter. Three wells penetrate the Moenkopi Formation, but only one yields water. One well obtains its water from the Redwall Limestone, and the water level is 2,200 feet below the land surface. About 60 cubic feet per second of water is discharged by springs that issue from the Redwall and Muav Limestones along the east wall of the canyon of the Little Colorado River. Information on the map includes depth to water, altitude of the water level, specific conductance, and fluoride concentrations. Scale 1:125,000. (Kosco-USGS)

HYDROLOGIC RECORDS, VERNA WELL-FIELD AREA, CITY OF SARASOTA, FLORIDA, 1962-76--A DATA REPORT,
Geological Survey, Tallahassee, FL. Water Resources Div.
H. Sutcliffe, Jr., and A. Buono.
Available from OFSS, U.S. Geological Survey, Box 25425, Federal Center, Denver, CO 80225, Price codes: $18.50 in paper copy, $3.50 in microfiche. Geological Survey open-file report 79-1259, 1979. 141 p, 11 Fig, 13 Tab, 4 Ref.

Descriptors: *Hydrologic data, *Water wells, *Florida, *Groundwater, *Water supply, Aquifer characteristics, Drillers logs, Water level fluctuations, Pumping, Test wells, Chemical analysis, Specific capacity, Verna-well field area(Fla), Sarasota(Fla).

A short history of the development and operation of the Verna well field in Florida is presented. Also included are geological, drillers' and selected geophysical logs of test and production wells; chemical analyses; specific capacity tests; pumpage; physical dimensions of wells; and source for other data available as indicated. (Kosco-USGS)
W80-03485

CHARACTERISTICS OF FOUR URBANIZED BASINS IN SOUTH FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
R. A. Miller.
Geological Survey open-file report 79-694, May 1979. 45 p, 17 Fig, 17 Tab, 9 Ref.

Descriptors: *Watersheds(Basins), *Urban hydrology, *Urban runoff, *Hydrologic data, *Florida, Model studies, Rainfall-runoff relationships, Storm runoff, Data collections, *South Florida.

Physical characteristics of four urbanized basins in south Florida are presented. Land use of the four basins are low-density residential, highway, commercial, and high-density residential. Maps of each basin include a photomosaic, a sewerage map, a drainage map, and an impervious-area map. Tabular data include pervious and impervious areas; sewer data, such as pipe diameter, length, and slope; and inlet elevations. General descriptions of the soil cover and type, vegetation, streets, gutters and curbs are also provided. (Kosco-USGS)

WATER RESOURCES DATA FOR NEW HAMPSHIRE AND VERMONT, WATER YEAR 1978.
Geological Survey, Boston, MA. Water Resources Div.
Geological Survey Water-Data Report NH-VT-78-1, October 1979, 199 p, 3 Fig, Append.

Descriptors: *New Hampshire, *Vermont, *Hydrologic data, *Surface waters, *Groundwater, Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water-resources data for the 1978 water year for New Hampshire and Vermont consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels and water quality of wells. This report contains discharge records for 83 gaging stations, stage records for 4 lakes, monthend contents for 25 lakes and reservoirs, water-quality data for 7 gaging stations, and water levels for 42 observation wells. Also included are data for 37 crest-stage partial-record stations and 6 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. A few pertinent stations (not included above) in bordering States and Province of Quebec are also included in this report. These data represent that portion of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in New Hampshire and Vermont. (Kosco-USGS)

WATER-RESOURCES INVESTIGATIONS OF THE U.S. GEOLOGICAL SURVEY IN WYOMING, FISCAL YEAR 1979,
Geological Survey, Cheyenne, WY. Water Resources Div.
D. D. Carlson, and S. L. Green.
Available from: OFSS, USGS Bx 25425, Fed. Ctr. Denver, CO printed copy $15.50 microfiche $3.50, Geological Survey open-file report 79-1278, 1979. 115 p, 11 Fig, 5 Tab.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *Wyoming, Hydrologic data, Water supply, Streamflow, Flow rates, Sediment transport, Reservoirs, Observation wells, Projects, Publications, Annual, Reviews.

This report contains lists of surface-water stations, ground-water stations, water-quality stations, sediment stations, and peak-flow partial-record stations in Wyoming. The locations of the data-collection sites are shown on maps. Water-resources projects in Wyoming are also described, including many that are related to development of energy resources. The general locations of the projects are shown on maps. The U.S. Geological Survey is striving to coordinate its water-resources investigations with those of other agencies. This report serves as an annual progress report to cooperators and the public. (Kosco-USGS)
W80-03495

WATER RESOURCES DATA FOR PENNSYLVANIA, WATER YEAR 1978--VOLUME 1. DELAWARE RIVER BASIN.
Geological Survey, Harrisburg, PA. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-118862,

Price codes: A17 in paper copy, A01 in microfiche. Geological Survey Water-Data Report PA-78-1, September 1979. 374 p, 12 Fig, 4 Tab.

Descriptors: *Pennsylvania, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Delaware River basin(PA).

Water resources data for the 1978 water year for Pennsylvania consist of records of discharge, and water quality of streams, contents of lakes and reservoirs; and water levels of ground-water wells. This volume contains records for water discharge at 83 gaging stations, contents at 10 lakes and reservoirs, water quality at 59 gaging stations and water levels at 16 observation wells. Also included are data for 43 crest-stage, 35 low-flow, and 44 water-quality partial record stations. Locations of these sites are shown on figures 4 and 5. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellanous measurements and analyses. These data together with the data in Volume 2 and 3 represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State, local, and Federal agencies in Pennsylvania. WELL DRILLING FOR +250F WATER,
Oregon Inst. of Tech., Klamath Falls. Geo-Heat Utilization Center.
G. G. Culver.
Geo-Heat Utilization Center Quarterly Bulletin, Vol 3, No 1, p 8-10, August, 1977. 1 Fig.

Descriptors: *Geothermal studies, *Drilling, *Shallow wells, *Heat exchangers, Depth, Heating, Costs, Thermal water.

In most areas, cable tool or rotary drilling rigs that are used for water wells can also be used for geothermal wells. The maximum depth and diameter of the well depends on the size of the rig and the type of formations encountered. Cable tool rigs are generally limited to 3,000 ft. while rotary rigs can go as deep as 3,500 ft. with excellent drilling conditions. Downhole heat exchangers can be installed in a hot water well to meet the heating needs of one or more homes. City water is circulated in the heating loop making a completely closed system. Since no geothermal water is removed from the well, there are no disposal problems. A 500 foot deep, 16 inch diameter well can produce about 2.8 million BTU's per hour without lowering the well temperature. That is enough heat for about 30 average homes. The cost for this well would be about $25,000 not including the cost of the piping system to distribute the hot water. (Purdin-NWWA)

VORTEX PROBLEM AT INTAKE, LOWER ST. ANTHONY FALLS LOCK AND DAM, MISSISSIPPI RIVER, MINNEAPOLIS, MINNESOTA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
J. H. Ables, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A072 918, Price codes: A04 in paper copy, A01 in microfiche. Technical Report HL-79-9, May 1979. 69 p, 5 Tab, 19 Photos, 18 Pl.

Descriptors: *Vortices, *Intakes, *Hydraulic models, *Locks, Dams, Design criteria, *St. Anthony Falls Lock & Dam(Mississippi River), Minnesota, Minneapolis(Minn).

A 1:25-scale model was used to develop the most feasible and permanent solution to a vortex problem at the Lower St. Anthony Falls Lock Intake on the Mississippi River at Minneapolis, Minnesota. On 10 March 1974, a lock employee in a small boat was accidentally drawn into the vortex and killed. Since then a delayed valve-operating schedule has been used, with a fill time in excess of 14 min, about twice the design fill time; and although the vortex condition is reduced, conditions are not considered satisfactory or safe. Recommended design (type 5) moved the intakes from the top of the upper gate sill and positioned a new intake in the upstream face of the sill, lowered the approach geometry in the approach to the intake ports, lengthened the bull-nose pier between the existing lock and a possible future auxiliary lock and replaced the 7.5-ft-radius nose of the pier with an elliptical nose, added a vortex suppressor across the 56-ft-wide approach, and modified the culvert tainter control valve schedule from 2.07 min to 4.14 and 6.21 min. These modifications to the intake, geometry of the structure, and approach, together with the slower valve schedules, permitted vortex-free lock operation. (WES)

STABILITY AND STRESS ANALYSES OF BRANDON ROAD DAM, ILLINOIS WATERWAY,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
C. E. Pace, and R. L. Campbell.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A064 811, Price codes: A09 in paper copy, A01 in microfiche. Miscellaneous Paper C-78-18, December 1978. 195 p, 9 Fig, 10 Tab, 8 Ref, 2 Append.

Descriptors: *Dams, *Stability, *Stress analysis, Finite element analysis, Design criteria, *Illinois waterway, *Brandon Road Dam.

The tainter-gate, sluice-gate, ice-chute, and head-gate monoliths of Brandon Road Dam were analyzed to determine if they meet present-day stability requirements. Stability analyses for the monoliths were performed for these case loadings: (1) normal operation, (2) normal operation plus ice, (3) normal operation plus earthquake, and (4) flood condition. In the analyses of the tainter-gate, sluice-gate, and ice-chute monoliths, the total monolith for each was analyzed and determined to be adequate in stability. However, due to overstress between the main body and the downstream apron of the structures, the aprons of each were considered ineffective and were eliminated from the analyses. Shear stresses in the keys that connect the pier and spillway sections of the tainter-gate monoliths were calculated and found to be less than the allowable 1.1 sq. rt. f'c. Therefore, the pier and spillway are considered to act monolithically. In the stability analyses of the tainter-gate, sluice-gate, ice-chute, and head-gate monoliths, results showed the monoliths to be inadequate against overturning stability for all case loadings. The head-gate monoliths were also inadequate for resistance against sliding. To correct these deficiencies, prestressing was recommended and the details are presented for each of the monoliths. (WES)

FILLING AND EMPTYING SYSTEM, NEW SHIP LOCK, MISSISSIPPI RIVER-GULF OUTLET, LOUISIANA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
J. H. Ables, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A062 074, Price codes: A07 in paper copy, A01 in microfiche. Technical Report H-78-16, September 1978. 100 p, 4 Pho, 43 Pl, 15 Tab, 7 Ref.

Descriptors: *Locks, *Hydraulic models, *Design criteria, Barges, Barge tow tests, *New Ship Lock(La), *Mississippi River-Gulf Outlet(La).

Test results of the hydraulic system for the proposed New Ship lock in a 1:25-scale hydraulic

model are presented. The original intake and outlet designs which must perform as both intakes and outlets were investigated and found to be satisfactory. Tests of 20 sidewall port manifold arrangements resulted in the recommendation of the type 15 sidewall port manifold arrangement. This arrangement consisted of 20 original design ports (throats 5 by 3.25 ft), spaced 38 ft on centers in each 18.5 by 18.5-ft wall culvert with the ports staggered in opposite walls. For the lock to perform satisfactorily for deep-draft ships, the chamber floor must be constructed at a lower invert elevation than for barge tows. Sufficient ship model input data were presented to permit necessary economic analysis to determine the feasibility of the type 15 (recommended) design manifold port system as developed with some lowering of the chamber floor and manifolds between the miter gates. The type 15 (recommended) design sidewall port system as developed is considered optimum for barge tows and satisfactory for ships with proper clearance provided between the bottom of the ships and floor of the lock chamber. OUTLET STRUCTURE FOR MERAMEC LAKE, MERAMEC RIVER, MISSOURI; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
B. P. Fletcher.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A062 109, Price codes: A04 in paper copy, A01 in microfiche. Technical Report H-78-15, October 1978. 59 p, 12 Pho, 30 Pl, 4 Tab.

Descriptors: *Outlet works, *Intake structures, *Hydraulic models, Lakes, Missouri, Design criteria, *Meramec Lake(Mo).

Model investigation of the outlet works for Meramec Lake was concerned with verification and improvement of the hydraulic performance of the intake structure, transition, conduit, stilling basin, and exit channel. Hydraulic performance of the original and revised outlet works with 22- and 14-ft-wide horseshoe-shaped conduits, respectively, was investigated by means of 1:40- and 1:25.5-scale models. Flow distribution into the stilling basin was improved by providing a 38-ft-long horizontal apron immediately downstream of the 14-ft-wide conduit and placing the sidewalls 1 laterally in 16 longitudinally from the exit portal to the end sill. General discharge characteristics of the outlet works were defined as well as the minimum size and extent of stone protection required in the exit channel immediately downstream of the flared stilling basin. SIDE-CHANNEL SPILLWAY AND OUTLET WORKS FOR SAN ANTONIO DAM; HYDRAULIC MODEL INVESTIGATION,
Army Engineer District, Los Angeles, CA.
D. A. Barela.
Report No 2-106, October 1978. 56 p, 36 Photos, 12 Pl, 1 Tab, 1 Append.

Descriptors: *Spillways, *Outlet works, *Hydraulic models, Design criteria, Engineering structures, *San Antonio Dam, *Side-channel spillways.

Model studies of proposed uncontrolled side-channel spillway and outlet works for San Antonio Dam were conducted to develop, by means of 1:36- and 1:48-scale models of the spillway and a 1:20-scale model of the outlet works, satisfactory and economical designs for these elements. Particular attention was given to flow characteristics in the side channel, spillway chute, and flip bucket for side-channel spillway and to performance of the intake structure, outlet conduit, and diversion structure for the outlet works. Although the spillway crest functioned satisfactorily as originally designed, excessive ride-up and turbulence in the side channel during maximum design flow of 54,000 cfs indicated need for improved performance of the channel. Addition of baffle blocks on side-channel invert provided adequate control of flow and reduced excessive ride-up occurring in the channel. Flow in the spillway chute was more stable and less turbulent. Tests of the intake structure and outlet circular conduit disclosed flow conditions were acceptable. Results revealed for a discharge of 1,000 cfs, performance of the diversion structure was satisfactory. Measured discharge to each part of the spreading grounds agreed with design assumptions. As flow in the outlet conduit was increased, however, disturbance at entrance to chamber became more pronounced. (WES)

SOUTH JETTY STABILITY STUDY, MASONBORO INLET, NORTH CAROLINA: HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
R. D. Carver, and D. G. Markle.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A062 132, Price codes: A03 in paper copy, A01 in microfiche. Miscellaneous Paper H-78-12, October 1978. 41 p, 22 Photos, 6 Pl, 7 Ref.

Descriptors: *Jetties, *Stability, Model studies, Design criteria, Hydraulic models, *Coastal structures, *Breakwaters, North Carolina, *Armor units(Hydraulics), *Masonboro Inlet(NC).

Hydraulic model flume tests were conducted to investigate the stability response of a jetty cross section proposed for the South Jetty, Masonboro Inlet, North Carolina. The original design (Plan 1) was not stable, and three additional designs were tested in an effort to find a satisfactory solution. All designs tested consist of one layer of armor stone subjected to breaking wave conditions. None of the designs were completely stable for all the designated storm conditions, and sufficient funds were not available to further the investigation. Based on the tests conducted, results show that all the designs were stable for storm conditions at the 8.5 ft mllw swl, but none of the designs were stable for storm conditions at the 12.5 ft mllw swl. Thus, whether the designs tested meet the no-damage criteria depends upon the selection of the design storm condition. (WES)

THE EFFECT OF SALINITY ON GEOTHERMAL WELL PERFORMANCE,
California Univ., Livermore. Lawrence Livermore Lab.
J. Z. Grens.
Available from the National Technical Information Service, Springfield, VA 22161 as UCID-16791, Price codes: A02 in paper copy, A01 in microfiche. Report UCID-16791, May 14, 1975. 14 p, 5 Fig, 2 Tab, 13 Ref.

Descriptors: *Geothermal studies, *Salinity, *Wells, *Performance, Productivity, Energy loss, Brines, Density, Viscosity, Vapor pressure, Thermal capacity, Enthalpy, Entropy, Flow resistance.

As the salinity of geothermal brines increases, changes occur in physical and thermodynamic properties which strongly affect the energy content and availability of the brines and the performance of the producing wells. In a typical well flowing at 500 lb/sq.ft./sec. pressure losses are distributed roughly 1/4 to formation breakdown, 1/4 to friction, and 1/2 to hydrostatic loss. The higher density and lower vapor pressure which accompany increasing salinity both tend to add to the hydrostatic gradient in the flowing well. Two phase flow effects in the well bore add a few percent to the hydrostatic gradient. Energy yield is reduced due to low enthalpy of brines and decreased well flow. Each 1% dissolved solids reduces available energy by 0.8 to 0.9% compared to distilled water at the same temperature and pressure. The distribution of pressure losses will vary with formation properties, in situ conditions and well parameters. (Purdin-NWWA)

HEAD-LOSS MEASUREMENTS ON HYDRO-ELECTRIC CONDUITS,
Hydro-Electric Commission of Tasmania, Hobart (Australia).
T. M. Brett.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15109, p 173-190, January 1980. 6 Fig, 8 Tab, 11 Ref, 2 Append.

Descriptors: *Tunnel linings, *Canal design, *Australia, Hydroelectric plants, *Head loss, Penstocks, *Pipe flow, Pipelines, Hydraulics, Friction, Algae, Aquatic plants, *Hydroelectric conduits, Friction coefficient(Hydraulic), Power generation, Power.

Prototype head-loss measurements on tunnels and other water conduits were reported. The measurements were done on water-power conduits of the Hydro-Electric Commission of Tasmania, Australia. Friction factors are given for an unlined tunnel, a mechanically bored partly lined tunnel, and a fully lined tunnel. Steel and woodstave friction factors were included together with factors for a concrete-lined trapezoidal canal. The effect of slime growth on head losses was discussed. (Lee-ISWS)

FLOW PAST FENCE IN TURBULENT BOUNDARY LAYER,
Roorkee Univ. (India). Dept. of Civil Engineering.
P. K. Pande, R. Prakash, and M. L. Agarwal.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15151, p 191-207, January 1980. 14 Fig, 1 Tab, 24 Ref, 2 Append.

Descriptors: *Turbulent boundary layers, *Flow around objects, *Flow separation, *Model studies, Mathematical models, Hydraulic models, Boundary layers, Flow rates, Turbulent flow, Friction, Flow friction, Fluid friction, Bubbles, Hydraulics, Fences.

The flow past a fence submerged in a turbulent boundary layer was studied experimentally. The characteristics of the flow both upstream and downstream of the fence were presented. The variation of boundary layer parameters, velocities, turbulence intensities, and skin friction were reported. The sizes of the upstream and downstream separation bubbles were also correlated with relevant parameters. The results were also compared with the numerical solution of momentum and energy integral equations for the approach boundary layer. (Sims-ISWS)

FEASIBILITY STUDY OF A NUMERICAL TOW MODEL,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
T. D. Ankeny, C. J. Huval, and L. L. Daggett.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A062 727, Price codes: A04 in paper copy, A01 in microfiche. Miscellaneous Paper H-78-11, September 1978. 52

p, 11 Tab, 12 Ref, 2 Append.

Descriptors: *Barges, *Mathematical models, *Feasibility, Transportation, Locks, Dams, Barge tow, *Towboats, Tows and towing, Ship maneuverability.

Explores the feasibility of developing a numerical hydrodynamic model of a typical push towboat-barge combination for use in engineering planning and design studies. Such a model might be used to simulate tow movements in restricted waterways in critical river reaches such as bends, bridges, and near navigation locks and dams to determine the adequacy and/or economic efficiency of channel designs. No information was available at the beginning of this study on numerical models of tow hydrodynamics or on towing tank or prototype tests of the maneuverability of tows. During the study several numerical models did become available, and this work is described. Since no information was available for the development or testing of a numerical tow maneuvering model, a series of measurements were made of radio-controlled scale model tows used in physical model studies involved in standard ship hydrodynamic maneuvers. Data from these measurements and computations were used to determine estimates of hydrodynamic coefficients of a linear model of ship maneuverability. Findings show tow maneuvers can be predicted by a numerical model of tow maneuverability; however, additional measurements of tow response characteristics are required before a model useful in engineering studies can be developed. SHAFT TORSIONAL OSCILLATIONS OF HYDROGENERATORS,
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
L. E. Eilts, and E. Campbell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-102155, Price codes: A03 in paper copy, A01 in microfiche. Report No REC-ERC-79-6, August 1979. 30 p, 16 Fig, 1 Tab, 2 Append.

Descriptors: *Hydroelectric plants, *Generators, *Electric generators, *Strain gages, Analog computers, Elasticity(Mechanical), Dynamics, Instrumentation, Resonance, Prototype tests, Model studies, Torsion, Turbines, Motor generators, Oscillation.

Shaft torsional oscillations of electrical generators are analyzed, modelled, and instrumented to study the torsional behavior of hydrogenerators and the effect of high-initial-response static excitation systems on damping of torsional oscillations. Block diagram and analog computer models were developed from mathematical equations modelling shaft torsional phenomena. Data calculated from several Bureau of Reclamation hydrogenerators are included. A single shaft torsional oscillation mode generally characterizes hydrogenerators. This oscillation mode is adequately damped due to viscous waterwheel damping. Results of tests at the Grand Coulee Powerplant show that hydrogenerator excitation systems have negligible effect on shaft torsional oscillations due to the large inertia of hydrogenerator rotors. An instrumentation system was developed for prototype field measurements. The system uses shaft-mounted strain gages to provide a torsional signal. The system was used to obtain shaft torsional oscillations data from three units and these data are presented along with the design and circuit configuration of the system. The information given is specifically applicable to hydrogenerators but is equally applicable to other types of generators. (Seigler-IPA)

ELECTRONIC FILTER LEVEL OFFSET (EL-FLO) PLUS RESET EQUIPMENT FOR AUTOMATIC DOWNSTREAM CONTROL OF CANALS,
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
C. P. Buyalski, and E. A. Serfozo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-104003, Price codes: A07 in paper copy, A01 in microfiche. Report No REC-ERC-79-3, June 1979. 151 p, 53 Fig, 20 Tab, 7 Ref, 6 Append.

Descriptors: *Canals, *Automatic control, *Irrigation canals, *Analog models, Analog computers, Mathematical models, Laboratory tests, Model studies, Water management(Applied), Water levels, Flow, Hydraulics, California, Arizona, Filters.

To upgrade the operation and efficiency of canal systems an automatic integrated circuit system of downstream control of canal gates was developed. The control mechanism, an analog computer controlled electronic filter level offset (EL-FLO) plus RESET was mathematically modeled, designed, constructed, and tested. The control system can handle complex irrigation water delivery schedules while maintaining nearly constant water levels in a canal system. An electronic time delay replaces the cumbersome hydraulic filter to eliminate the inherent sustained water level oscillations for automatic flow regulation systems. The RESET controller eliminates the residual water offset associated with proportional control. Laboratory simulation tests were performed to confirm that the control system was designed and built as modeled and to test equipment performance at high temperatures and high humidity. Field tests of the control system conducted at the South Gila Canal in Arizona and the Corning Canal in California verified the accuracy of the systems' response characteristics. Following the positive testing results EL-FLO plus RESET specifications were written and 21 units were permanently installed in California on the Coring and Coalinga Canals. Extensive test result data are included. (Seigler-IPA)

TWENTY YEARS OF EXPERIENCE WITH WELL-WATER-SOURCE HEAT PUMPS AT BATTELLE'S COLUMBUS LABORATORIES,
Battelle Columbus Lab., OH.
R. D. Fischer, C. F. Holt, S. G. Talbert, and T. E. Maloy.
Paper presented at the 4th Annual Heat-Pump Technology Conference, Oklahoma State University, Stillwater, Oklahoma, April 9-10, 1979. 8 p, 4 Fig, 1 Tab, 3 Ref.

Descriptors: *Heat pumps, *Ground water, Well spacing, Safe yield, Pumping, Cost comparisons, Operating costs, Heating, Cooling, Maintenance, Shallow wells, Scaling.

Two similar heat pumps, installed 20 years ago, are still providing primary comfort-conditioning needs of four laboratory and office buildings with a total floor area of approximately 320,000 sq. ft. These systems use as a heat source, ground water from five shallow wells in sand and gravel of the Olentangy River flood plain. The maximum safe yield of the well field is 1400 gpm. The cost of heating with four conventional fuels is compared with that for the ground water heat pump. The heat pump costs slightly less than coal and natural gas. The coefficient of performance of the heat pump system is 4.4 which means that 4.4 times as much energy is obtained from the system as is put into it. Monthly well-water consumption and electric power consumption of the compressor motors are given for 13 years. Yearly maintenance procedures, operational problems that were solved, and future plans are discussed. (Purdin-NWWA)
W80-03425

SELECTION AND DESIGN OF INJECTOR PUMP SYSTEMS,
J. Rossetti.
Canadian Water Well, Vol 5, No 3, p 28, 30, August, 1979. 4 Fig.

Descriptors: *Pumps, *Design criteria, Storage tanks, Pipes, Water wells, Deep-well pumping, Water delivery, Water utilization.

The design and selection of shallow (+25 ft.) and deep (+60 ft.) well injector pumps are discussed. Selection of the proper injector pump depends on: (1) inside diameter of well; (2) depth of well; (3) pumping water level; (4) capacity of well; (5) capacity and pressure requirements of the system. Selection would be made from pump performance tables. In some cases, where the inside diameter of a deep well is too small for a parallel pipe injector, an inner pipe injector can be used. Single stage shallow well injector pumps should be capable of pressures of 30 to 50 psi. For higher operating pressures, multi-stage shallow well injector pumps are available with discharge pressures up to 110 psi. Most deep and shallow well water systems use plastic pipe due to its low cost, reduced friction loss, and low installation cost. However, the grade of pipe must be strong enough to withstand the pressure. Pre-charged pressure tanks deliver more water between cycles but tankless water systems with constant pressure are growing in popularity. To protect the system from freezing, pipes must be buried deep enough and pumps should be heated. A good system will include a gate valve between the pump and tank and a priming tee. (Purdin-NWWA)
W80-03429

DOWNHOLE PUMPS FOR WATER SAMPLING IN SMALL-DIAMETER WELLS,
Geological Survey, NSTL Station, MS. Water Resources Div.
F. C. Koopman.
Available from OFSS, U.S Geological Survey, Box 25425, Federal Center, Denver, CO 80225, Price codes: $8.50 in paper copy, $3.50 in microfiche. Geological Survey open-file report 79-1264, 1979. 61 p, 1 Fig, 5 Tab.

Descriptors: *Pumps, *Groundwater, *Sampling, *Water wells, *Methodology, Deep-well pumping, Specifications, Equipment, Design, Performance, *Small-diameter wells.

The relatively high cost and difficulty in locating a source of pumps for use in obtaining ground-water samples from small-diameter wells has demonstrated a need for this report. Criteria for selection of a pump and pumping equipment to meet specific requirements has been tabulated to assist field personnel in making a selection from commercial sources. (Kosco-USGS)

8D. Soil Mechanics

LABORATORY PROCEDURES FOR DETERMINING THE DISPERSIBILITY OF CLAYEY SOILS,
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
J. L. Kenney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-301 097, Price codes: A03 in paper copy, A01 in microfiche. Report No REC-ERC-79-10, September 1979. 24 p, 12 Fig, 4 Tab, 26 Ref, 1 Append.

Descriptors: *Clays, *Soil tests, *Dispersion, *Soil analysis, *Hydrometers, *Erosion rates, Chemical analysis, Laboratory tests, Cation adsorption, Cations, Soil texture, Soil aggregates, Soil types, Turbidity, Chemical analysis, Instrumentation.

Procedures for the following dispersive clays tests are described: the pinhole test, chemical analyses, double hydrometer test, and the crumb test. All four tests are used to measure the potential dispesibility or erodibility of clayey soils which are difficult to distinguish from nonerodible clays by conventional index tests. For the pinhole test five equal lifts of sample soil totaling 38 mm in height are molded and allowed to stabilize for 16 hours in a sealed cylinder. A truncated brass cone is pushed into the upstream end of the sample and a 1 mm-diameter hypodermic needle is pushed through the entire sample to produce the 'pinhole'. After adding screens and glass spheres, the sample is placed horizontally and distilled water under a 50 mm hydrostatic head is passed through the sample. Results from this flow are used along with electrical conductivity, turbidity, and pH to measure the

dispersibility of the sample. Chemical testing procedures are used to identify potentially dispersive clays by isolating and identifying soluble water cations and cations adhering to clay particle surfaces. The crumb test or aggregate coherence test involves the timed hydrating or crumbling of a 15 mm cube of soil in 250 ml of distilled water. For the double hydrometer test two identical 200 g samples are used. One sample is subjected to standard graduation analysis while the other is dried, rehydrated, deaired and then measured. INVESTIGATIONS INTO THE EFFECTS OF VOLUME OF WATER FLOW, QUALITY OF FEED AND TYPE OF FEEDING ON THE PRODUCTION OF THE AISCHGRUND COMMON CARP, CYPRINUS CARPIO, IN CIRCULAR CONCRETE PONDS UNDER HIGH STOCKING DENSITY RATES,
Lowveld Fisheries Research Station, Marble Hall (South Africa).
F. D. W. Brandt, and H. J. Schoonbee.
Water SA, Vol 5, No 4, p 171-177, October 1979. 2 Fig, 5 Tab, 14 Ref.

Descriptors: *Carp, *Proteins, *Fish diets, *Fish farming, *Fish populations, Fish harvest, Fish stocking, Fisheries, Flow, Concrete structures, Irrigation water, Water reuse, Density, Oxygenation, Ponds, Agriculture.

Changes in protein content of pelleted fish feed and changes in water flow were tested during the summers of 1974 through 1976 as means of increasing fish production and conserving water in the growth of fish at the Lowveld Fisheries Research Station at Marble Hall, South Africa. Due to the shortage of water in the area and its demand for irrigation, water is used first for fish production and then for irrigation. The fish used for the tests was the Aischgrund common carp, Cyprinus carpio, which was imported from Germany. The fish were grown in circular concrete ponds having a capacity of 16.1 cu m and in water transported by canal from the Loskop Dam Irrigation Scheme. To test protein content of feeds the ponds were stocked with 1000 carp fingerlings each for a density of 62/cu m of pond water. Types of feed tested were trout pellets with 42% protein and carp pellets with 25% protein. Some ponds were fed by hand and some were equipped with a demand feeder. Results show that the 42% protein pellet was superior to the 25% protein pellet for production of fish at high densities. Pond water flow effects on production were also tested by regulating flow by 1, 2, or 3 liters. Ponds were again stocked at 62/cu m density. Flow regulation results show that a slight increase in flow results in a major improvement in production capacity for the type of concrete pond and stocking density tested. (Seigler-IPA)

10. SCIENTIFIC AND TECHNICAL INFORMATION

10D. Specialized Information Center Services

A TECHNOLOGY TRANSFER STUDY OF WATER RESOURCES: A SOUTH CAROLINA EXPERIENCE,
Clemson Univ., SC. Dept. of Political Science.
H. E. Albert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-149966, Price codes: A05 in paper copy, A01 in microfiche. Prepared for the South Carolina Water Resources Commission, July 1979. 74 p, 14 Fig. OWRT T-0020 (7705)(1).

Descriptors: *South Carolina, *Technology, *Groundwater, *Information exchange, Publications, Data collections, Research and development, Organizations, Administration, Water conservation, Education, Training, Brochures, Technology transfer.

Technology-transfer techniques used by the South Carolina Water Resources Commission (SCWRC) are examined with emphasis on the transfer of groundwater technology. Two basic groups of SCWRC information users are decision makers such as government officials or private industry and doers such as consulting engineers and well drilling contractors. A one year project is described that was designed to: (1) discover the state-of-the-art in technology transfer, (2) conduct seminars and workshops to transfer technology to users, and (3) develop a mailing list of potential users and a newsletter to lead to the establishment of a clearinghouse for recently developed technology. Interviews were conducted with various researchers to determine what research was being done, who was sponsoring it, what technology they hoped to develop, and who the expected users were. Groundwater investigations in the Lowcountry and in Horry, Georgetown, and Marion Counties were used as technology transfer demonstration projects. An existing mailing list for the newsletter, Palmetto Waters was expanded but is still disorganized and needs further attention. It is concluded that the SCWRC does an outstanding job of research and technology transfer given the constraints of its budget. Copies of several information bulletins are included. (Seigler-IPA)

CONTINENTAL SHELF
Hypsometry of the Continental Shelf off Eastern North America,
W80-03367 2L

Consistency for Department of the Interior Outer Continental Shelf (OCS) Prelease Sale Activities and for Other Federal Activities Directly Affecting the Coastal Zone (Final Rule).
W80-03408 6E

COOLING WATER
An Analysis of Water Resources Constraints on Power Plant Siting in the Mid-Atlantic States,
W80-03361 6D

Modified Amperometric Membrane Probes for Determining Free and Total Residual Chlorine in Saline Cooling Waters,
W80-03462 5A

Ohio River Basin Study--Comprehensive Survey: Volume X-Appendix I, Electric Power.
W80-03572 6B

COOS BAY (ORE)
Numerical Simulation of the Coos Bay-South Slough Complex,
W80-03559 2L

COPEPODS
Seasonal Cycles of Zooplankton Biomass in Southeastern Lake Michigan,
W80-03390 2H

Effects of Sublethal Oil Concentrations on the Copepod, Nitocra Affinis,
W80-03540 5C

COPPER
Two Heavy Metal-Binding Proteins in the Midgut Gland of the Crab Carcinus Maenas,
W80-03339 5B

COST-BENEFIT ANALYSIS
Managing Small Water Systems: A Cost Study, Volume II,
W80-03568 6C

COST-BENEFIT RATIO
A Dynamic Regional Impact Analysis of Federal Expenditures on a Water and Related Land Resource Project -- The Boise Project of Idaho. Part I: Direct Economic Impacts, Economics Subproject,
W80-03309 6B

COURT DECISIONS
Tidelands and the Public Trust: An Application for South Carolina,
W80-03526 6E

CRABS
Two Heavy Metal-Binding Proteins in the Midgut Gland of the Crab Carcinus Maenas,
W80-03339 5B

CREOSOTEBUSH
Evapotranspiration From an Arid Zone Plant Community,
W80-03548 2D

CROP PRODUCTION
The Effect of the Drought on British Agriculture,
W80-03447 2E

Arid Lands Biomass Production in Arizona,
W80-03546 2I

CROP RESPONSE
The Effect of the Drought on British Agriculture,
W80-03447 2E

Wastewater Helps the Barley Grow,
W80-03547 3C

CURRENTS (WATER)
Factors Influencing Water Movements in the Firth of Clyde,
W80-03369 2L

CUTRINE
Evaluation of Cutrine for Use in Fish Culture,
W80-03335 5A

CYCLING NUTRIENTS
Phosphorus Recycle and Chlorophyll in the Great Lakes,
W80-03388 5C

Nutrient and Particulate Fluxes in a Salt Marsh Ecosystem: Tidal Exchanges and Inputs by Precipitation and Groundwater,
W80-03532 2I

DAM CONSTRUCTION
Dam Safety: The Critical Imperative,
W80-03499 6E

DAM FAILURE
Dam Safety: The Critical Imperative,
W80-03499 6E

DAMS
Dams Around the Holy City of Medina, and the Pressure on Its Water Supply,
W80-03549 6B

Stability and Stress Analyses of Brandon Road Dam, Illinois Waterway,
W80-03558 8A

DAPHNIA
Longevity and Reproduction of Daphnia Pulex (De Geer) Exposed to Cadmium-Contaminated Food or Water,
W80-03439 5A

DATA COLLECTIONS
Analytical Study of the Ogallala Aquifer in Carson County, Texas, Projections of Saturated Thickness, Volume of water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W80-03451 7C

Use of Environmental Data in Assessing the Quality of Irrigation Water,
W80-03471 5G

Movement of Suspended Particles and Solute Concentrations with Inflow and Tidal Action,
W80-03564 2L

Managing Small Water Systems: A Cost Study, Volume II,
W80-03568 6C

DATA PROCESSING
Use of Synographic Techniques in Research and Dissemination of Hydrological Information,
W80-03360 7C

DATING
Archeological Investigations Along the Salt-Gila Aqueduct,
W80-03321 6B

DECOMPOSITION
Spartina Alterniflora Seed Fungi,
W80-03509 2I

Changes in Decomposition Rate, Microbial Population and Carbohydrate Content of an Acid Peat Bog After Liming and Reclamation,
W80-03534 2G

DEICERS
Road De-Icing Salts in an Urban Stream and Flood Control Reservoir,
W80-03468 5B

DELAWARE RIVER BASIN (PA)
Water Resources Data for Pennsylvania, Water Year 1978--Volume 1. Delaware River Basin.
W80-03496 7C

DEMONSTRATION WATERSHED
Some Detailed Water Balance Studies of Research Catchments,
W80-03446 2A

DENDROCHRONOLOGY
Tree Rings as Indicators of Hydrologic Change in the Great Dismal Swamp, Virginia and North Carolina,
W80-03490 7B

DENSITY
Seasonality, Density and Diversity of Birds of a Papyrus Swamp in Western Kenya,
W80-03508 2I

DESALINATION
Process Design of a 100,000 Gallon per Day Vacuum Freezing Ejector Absorption Pilot Plant,
W80-03301 3A

Desalinization and Chemical Extraction Process,
W80-03464 3A

DESALINATION FREEZING PROCESS
Process Design of a 100,000 Gallon per Day Vacuum Freezing Ejector Absorption Pilot Plant,
W80-03301 3A

DESALINATION PLANTS
The Economic Feasibility of Dual Purpose Nuclear Desalination of Ground Water,
W80-03544 3A

DESALINATION PROCESSES
Alumina-Lime-Soda Pilot Plant Testing at the U.S. Bureau of Reclamation Desalting Test Station at Yuma, Arizona,
W80-03307 5F

Desalinization and Chemical Extraction Process,
W80-03464 3A

DESERT PLANTS
Evapotranspiration From an Arid Zone Plant Community,
W80-03548 2D

DESERTS
Salt Marshes and Salt Deserts of the World,
W80-03504 2L

DESIGN CRITERIA
Selection and Design of Injector Pump Systems,
W80-03429 8C

Filling and Emptying System, New Ship Lock, Mississippi River-Gulf Outlet, Louisiana; Hydraulic Model Investigation,
W80-03561 8A

DESIGN FLOOD
Floodflow Characteristics of Butternut Creek and Jamesville Reservoir, Jamesville, Onondaga County, New York,
W80-03488 2E

DESTRATIFICATION
Effects of Destratification on Sediment Chemistry and Benthic Macroinvertebrates in Ham's Lake,
W80-03308 2H

DEVELOPING COUNTRIES
Designing for Development: What is Appropriate Technology for Rural Water and Sanitation.
W80-03592 6B

DIATOMS
Fundamental Studies on the Influence of Oil Pollution Upon Marine Organisms--IV the Toxicity of Mixtures of Oil Products and Oil-Spill Emulsifiers to Phytoplankton (In Japanese),
W80-03338 5C

DICHLOROBENZIDINE (DCB)
Accumulation, Elimination, and Metabolism of Dichlorobenzidine in the Bluegill Sunfish,
W80-03334 5B

DISINFECTION
The Placing of the Disinfection Stage in a Reclamation Plant to Reduce Haloform Formation,
W80-03324 5F

Iodophor Disinfection of Muskellunge Eggs Under Intensive Culture in Hatcheries,
W80-03337 5A

DISPERSANTS
Fundamental Studies on the Influence of Oil Pollution Upon Marine Organisms--IV the Toxicity of Mixtures of Oil Products and Oil-Spill Emulsifiers to Phytoplankton (In Japanese),
W80-03338 5C

DISPERSION
Laboratory Procedures for Determining the Dispersibility of Clayey Soils,
W80-03316 8D

A Comparison of the Axial Distributions of Salt and 137CS in the Severn Estuary During August 1974,
W80-03373 5B

Longitudinal Dispersion in Rivers,
W80-03378 5B

Presentation of Longitudinal Dispersion Data,
W80-03379 2E

One-Dimensional Transient Model for Short-Term Prediction of Downstream Pollution in Rivers,
W80-03461 5B

DISPOSAL
Responses of Freshwater Benthos to Open-Lake Dredged Spoils Disposal in Lake Erie,
W80-03391 5C

Disposal of Dredged Material Within the New York District: Volume I-Present Practices and Candidate Alternatives,
W80-03586 5B

DISSOLVED OXYGEN
The Contribution of Macrophytes to the Metalimnetic Oxygen Maximum in a Montane, Oligotrophic Lake,
W80-03533 2I

DISTRIBUTION
Vegetation and Nutrient Status of Northern Michigan Fens,
W80-03523 2I

DISTRIBUTION PATTERNS
Species Versatility in Shore Habitats,
W80-03521 2I

DITCHES
The Immediate Effects of Ditching a Saltmarsh on Nesting Herring Gulls Larus Argentatus,
W80-03520 4A

DIVERSION
On Man-Induced Variations in the Circulation of the Mediterranean Sea,
W80-03354 2L

DOLPHIN
Total Mercury Content in Some Marine Fish from the Indian Ocean,
W80-03343 5B

DOMESTIC WATER
South Dakota Ground Water and the Artesian Pressure: Is the Use of Water for Domestic Purposes Still the Highest Use.,
W80-03420 6E

DOMINANT ORGANISMS
Meiofauna Development on Artificial Soft Bottoms in Kiel Bay (In German),
W80-03346 5A

DRAINAGE EFFECTS
The Immediate Effects of Ditching a Saltmarsh on Nesting Herring Gulls Larus Argentatus,
W80-03520 4A

DRAINAGE SYSTEMS
Maximum Utilization of Water Resources in a Planned Community -- Application of the Storm Water Management Model, Volume I,
W80-03565 4A

DRAWDOWN
Theis Parameter Evaluation from Pumping Tests by Sensitivity Analysis,
W80-03357 2F

Ecology of Water-Level Manipulations on a Northern Marsh,
W80-03515 2I

DREDGED MATERIAL
A Selected Bibliography of the Life Requirements of Colonial Nesting Waterbirds and Their Relationship to Dredged Material Islands,
W80-03393 5C

Evaluation of Dredged Material Pollution Potential,
W80-03395 5C

Processes Affecting the Fate of Dredged Material,
W80-03396 5E

Confined Disposal Area Effluent and Leachate Control (Laboratory and Field Investigations),
W80-03398 5E

Habitat Development Field Investigations, Buttermilk Sound Marsh Development Site, Atlantic Intracoastal Waterway, Georgia: Appendix A: Propagation of Marsh Plants and Post-Propagation Monitoring,
W80-03399 5E

Habitat Development Field Investigations, Bolivar Peninsula, Marsh and Upland Habitat Development Site, Galveston Bay, Texas; Summary Report,
W80-03402 5E

Disposal of Dredged Material Within the New York District: Volume I-Present Practices and Candidate Alternatives,
W80-03586 5B

DREDGED MATERIAL DISPOSAL
Processes Affecting the Fate of Dredged Material,
W80-03396 5E

DREDGING
Responses of Freshwater Benthos to Open-Lake Dredged Spoils Disposal in Lake Erie,
W80-03391 5C

Evaluation of Dredged Material Pollution Potential,
W80-03395 5C

Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia: Appendix F: Environmental Impacts of Marsh Development with Dredged Material: Sediment and Water Quality,
W80-03400 5E

Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia, Appendix E: Environmental Impacts of Marsh Development with Dredged Material: Metals and Chlorinated Hydrocarbon Compounds in Marsh Soils and Vascular Plant Tissues,
W80-03401 5E

Habitat Development Field Investigations, Bolivar Peninsula, Marsh and Upland Habitat Development Site, Galveston Bay, Texas; Summary Report,
W80-03402 5E

The Effect of the Marsh Elder (Iva Frutescens) on the Standing Crop Biomass of Spartina Patens and Associated Wildlife,
W80-03516 2I

Disposal of Dredged Material Within the New York District: Volume I-Present Practices and Candidate Alternatives,
W80-03586 5B

DRILLING
Geothermal Well Drilling Estimates Based on Past Well Costs,
W80-03427 6B

Well Drilling for +250F Water,
W80-03428 8A

DROUGHTS
Scientific Aspects of the 1975-76 Drought in England and Wales,
W80-03444 2E

Meteorological Aspects of the 1975-76 Drought,
W80-03445 2E

Some Detailed Water Balance Studies of Research Catchments,
W80-03446 2A

The Effect of the Drought on British Agriculture,
W80-03447 2E

The Effects of Drought on the River Systems,
W80-03448 2A

Pollution Problems Arising from the 1975-76 Drought,
W80-03449 2E

Planning for Development of Groundwater and Surface Water Resources,
W80-03450 2E

DUNE SANDS
Adverse Effects of Recreation on Sand Dunes: A Problem for Coastal Zone Management,
W80-03417 6E

E. COLI
The Survival of Coliform Bacteria in Saline Sediments,
W80-03386 5B

EAST ANGLIA (ENGLAND)
Seasonal Shifts of Sediment Within an Estuary Mediated by Algal Growth,
W80-03374 2J

EASTERN U.S.
Hypsometry of the Continental Shelf off Eastern North America,
W80-03367 2L

ECOLOGICAL DISTRIBUTION
Environment, Vegetation and Phytogeography of the High-Altitude Bogs of Lesotho,
W80-03507 2I

Seasonal and Spatial Changes in the Composition of the Aquatic and Semiaquatic Vegetation of Lake Chilwa, Malawi,
W80-03512 2I

Vegetation Study Undertaken at the Lamto Sau Savanna Reserve (Ivory Coast)--(Vegetationskundliche Untersuchungen Im Savannenreservat Lamto (Elfenbeinkuste)),
W80-03527 2I

Vegetation Zonation Around Freshwater Springs of the Maharlu Salt Lake Near Shiraz (Iran), Vegetationszonierung an Susswasserquellen des Maharlusalzsees Bei Shiraz (Iran),
W80-03537 2I

ECONOMETRICS
Managing Small Water Systems: A Cost Study, Volume II,
W80-03568 6C

ECONOMIC EFFICIENCY
Economics of Irrigation and the Institutional and Pricing Systems of Water in Israel,
W80-03554 6C

ECONOMIC FEASIBILITY
The Economic Feasibility of Dual Purpose Nuclear Desalination of Ground Water,
W80-03544 3A

ECONOMIC IMPACT
A Dynamic Regional Impact Analysis of Federal Expenditures on a Water and Related Land Resource Project -- The Boise Project of Idaho. Part I: Direct Economic Impacts, Economics Subproject,
W80-03309 6B

Application of Operations Research Techniques for a Problem in Water Resources Management: Economic Appraisal of Changes in Water Use Induced by Investments into Navigable Rivers and Canals,
W80-03501 6A

ECONOMIC JUSTIFICATION
A Dynamic Regional Impact Analysis of Federal Expenditures of a Water and Related Land Resource Project -- The Boise Project of Idaho, Part III: Economic Scenario of the Boise Region 'Without' a Federal Irrigation Project, Economics Subproject,
W80-03311 6B

ECONOMIC PREDICTION
A Dynamic Regional Impact Analysis of Federal Expenditures of a Water and Related Land Resource Project -- The Boise Project of Idaho, Part III: Economic Scenario of the Boise Region

'Without' a Federal Irrigation Project, Economics Subproject,
W80-03311 6B

Ohio River Basin Study--Comprehensive Survey: Volume V-Appendix D, Water Supply and Water Pollution Control.
W80-03577 5G

Ohio River Basin Study--Comprehensive Survey: Volume III-Appendix B, Projective Economic Study.
W80-03579 6A

ECOSYSTEMS
Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. I: American Oysters and Brown Shrimp,
W80-03541 5C

EFFICIENCIES
Arid Lands Biomass Production in Arizona,
W80-03546 2I

EFFLUENTS
Confined Disposal Area Effluent and Leachate Control (Laboratory and Field Investigations),
W80-03398 5E

Water Quality Committee (Annual Report).
W80-03405 5G

EGYPT
The Problem of Phosphorus in the Eutrophic Lake Maryut,
W80-03371 5B

ELECTRIC GENERATORS
Shaft Torsional Oscillations of Hydrogenerators,
W80-03315 8C

ELECTRIC POWER
Ohio River Basin Study--Comprehensive Survey: Volume X-Appendix I, Electric Power.
W80-03572 6B

ELECTRIC POWER DEMAND
Ohio River Basin Study--Comprehensive Survey: Volume X-Appendix I, Electric Power.
W80-03572 6B

ELECTRIC POWER PRODUCTION
Ohio River Basin Study--Comprehensive Survey: Volume X-Appendix I, Electric Power.
W80-03572 6B

ELECTRICAL CONDUCTANCE
An Electrical Conductance Method for Determining Condensation and Evaporation Processes in Arid Soils with High Spatial Resolution,
W80-03470 2D

ELECTROLYSIS
Water Purification Method and Apparatus,
W80-03426 5D

Method of Generating Hydrogen and Oxygen From Water,
W80-03550 1B

EMBANKMENTS
Production and Structure in the Early Stages of Vegetation Development in the Lauwerszee-Polder,
W80-03524 2L

EMPLOYMENT
Ohio River Basin Study--Comprehensive Survey: Volume III-Appendix B, Projective Economic Study.
W80-03579 6A

ENGLAND
Land-Use and Upland Water Resources in Britain--A Strategic Look,
W80-03363 2A

Perspectives from Three Years Experience of Regional Water Services in Thames Water Authority,
W80-03364 5G

Minor Elements in the Sediments of the Thames Estuary,
W80-03370 2J

Seasonal Shifts of Sediment Within an Estuary Mediated by Algal Growth,
W80-03374 2J

The Determination of Estuarine Sedimentation Rates by 134CS/137CS and Other Artificial Radionuclide Profiles,
W80-03377 2J

Scientific Aspects of the 1975-76 Drought in England and Wales,
W80-03444 2E

Meteorological Aspects of the 1975-76 Drought,
W80-03445 2E

Some Detailed Water Balance Studies of Research Catchments,
W80-03446 2A

The Effect of the Drought on British Agriculture,
W80-03447 2E

The Effects of Drought on the River Systems,
W80-03448 2A

Pollution Problems Arising from the 1975-76 Drought,
W80-03449 2E

Planning for Development of Groundwater and Surface Water Resources,
W80-03450 2E

A Systems Model of Stream Flow and Water Quality in the Bedford-Ouse River--1. Stream Flow Modelling,
W80-03456 2E

ENVIRONMENTAL EFFECTS
A Dynamic Regional Impact Analysis of Federal Expenditures on a Water and Related Land Resource Project -- The Boise Project of Idaho, Part V: Environmental Impacts,
W80-03313 6B

Processes Affecting the Fate of Dredged Material,
W80-03396 5E

Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia: Appendix F: Environmental Impacts of Marsh Development with Dredged Material: Sediment and Water Quality,
W80-03400 5E

Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia, Appendix E: Environmental Impacts of Marsh Development with Dredged Material: Metals and Chlorinated Hydrocarbon Compounds in Marsh Soils and Vascular Plant Tissues,
W80-03401 5E

Habitat Development Field Investigations, Bolivar Peninsula, Marsh and Upland Habitat Development Site, Galveston Bay, Texas; Summary Report,
W80-03402 5E

Road De-Icing Salts in an Urban Stream and Flood Control Reservoir,
W80-03468 5B

The Effects of Waterfowl Management Practices on Mosquito Abundance and Distribution in Louisiana Coastal Marshes,
W80-03511 6G

The Effect of the Marsh Elder (Iva Frutescens) on the Standing Crop Biomass of Spartina Patens and Associated Wildlife,
W80-03516 2I

Avian Ecology of a Managed Glacial Marsh,
W80-03529 2I

ENZYMES
Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. I: American Oysters and Brown Shrimp,
W80-03541 5C

Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. II: Striped Mullet,
W80-03542 5C

EROSION CONTROL
Combined Vegetative-Structural Slope Stabilization,
W80-03455 4D

Laboratory Evaluation of Methods to Separate Fine Grained Sediment from Stormwater,
W80-03566 4D

EROSION RATES
Laboratory Procedures for Determining the Dispersibility of Clayey Soils,
W80-03316 8D

ESTER DOME AREA (ALASKA)
Environmental Path of Arsenic in Groundwater,
W80-03303 5B

ESTIMATED COSTS
Geothermal Well Drilling Estimates Based on Past Well Costs,
W80-03427 6B

ESTUARIES
Tracer Study of Sediment-Water Interactions in Estuaries,
W80-03368 2J

Factors Influencing Water Movements in the Firth of Clyde,
W80-03369 2L

Minor Elements in the Sediments of the Thames Estuary,
W80-03370 2J

Phytoplankton Production in a Turbid, Temperate Salt Marsh Estuary,
W80-03372 2L

A Comparison of the Axial Distributions of Salt and 137CS in the Severn Estuary During August 1974,
W80-03373 5B

Seasonal Shifts of Sediment Within an Estuary Mediated by Algal Growth,
W80-03374 2J

The Determination of Estuarine Sedimentation Rates by 134CS/137CS and Other Artificial Radionuclide Profiles,
W80-03377 2J

Numerical Simulation of the Coos Bay-South Slough Complex,
W80-03559 2L

ESTUARINE ENVIRONMENT
The National Estuarine Sanctuary Program,
W80-03416 6E

Production and Structure in the Early Stages of Vegetation Development in the Lauwerszee-Polder,
W80-03524 2L

EUTROPHICATION
The Problem of Phosphorus in the Eutrophic Lake Maryut,
W80-03371 5B

Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-Iri Bay of Lake Kasumigaura, Japan--I. Nutrient Influx and Phytoplankton Bloom,
W80-03467 5A

EVAPORATION
An Electrical Conductance Method for Determining Condensation and Evaporation Processes in Arid Soils with High Spatial Resolution,
W80-03470 2D

EVAPOTRANSPIRATION
An Improved Weighing Lysimeter Facility for Citrus Evapotranspiration Studies,
W80-03325 2D

Phreatophyte Evapotranspiration and its Potential Reduction Without Eradication,
W80-03442 2D

Evapotranspiration From an Arid Zone Plant Community,
W80-03548 2D

EXCESSIVE PRECIPITATION
Record Torrential Rainstorms on the Island of Hawaii, January-February 1979,
W80-03475 2B

EXPLORATION
Dowsing Achieves New Credence,
W80-03432 7B

FARM WASTES
Quality of Runoff from Land Receiving Surface Application and Injection of Liquid Dairy Manure,
W80-03443 5B

Proximity of Agricultural Areas to Major Aquifers in Connecticut,
W80-03480 7C

FEASIBILITY
Feasibility Study of a Numerical Tow Model,
W80-03562 8B

FEDERAL COASTAL ZONE MANAGEMENT ACT
Integrated Planning for Water Quality Management: The Federal Water Pollution Control Act Amendments of 1972 and Coastal Zone Management,
W80-03581 6E

FEDERAL GOVERNMENT
Nationalizing Lake Tahoe.
W80-03419 6E

FEDERAL WATER POLLUTION CONTROL ACT
U.S. Corporate Response to Environmental Objectives,
W80-03412 6E

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS
Integrated Planning for Water Quality Management: The Federal Water Pollution Control Act Amendments of 1972 and Coastal Zone Management,
W80-03581 6E

FEN
Vegetation and Nutrient Status of Northern Michigan Fens,
W80-03523 2I

FILTRATION
Liquid Treatment Apparatus,
W80-03585 5G

FIRTH OF CLYDE (SCOTLAND)
Factors Influencing Water Movements in the Firth of Clyde,
W80-03369 2L

FISH
Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. II: Striped Mullet,
W80-03542 5C

FISH AND WILDLIFE
Ohio River Basin Study--Comprehensive Survey: Volume VIII-Appendix G, Fish and Wildlife Resources.
W80-03574 6B

FISH DIETS
Investigations into the Effects of Volume of Water Flow, Quality of Feed and Type of Feeding on the Production of the Aischgrund Common Carp, Cyprinus Carpio, in Circular Concrete Ponds Under High Stocking Density Rates,
W80-03323 8I

FISH EGGS
Saprolegnia: Control of Fungus on Incubating Eggs of Pink Salmon by Treatment with Seawater,
W80-03336 5A

FISH FARMING
Investigations into the Effects of Volume of Water Flow, Quality of Feed and Type of Feeding on the Production of the Aischgrund Common Carp, Cyprinus Carpio, in Circular Concrete Ponds Under High Stocking Density Rates,
W80-03323 8I

FISH HATCHERIES
Iodophor Disinfection of Muskellunge Eggs Under Intensive Culture in Hatcheries,
W80-03337 5A

FISH MANAGEMENT
Iodophor Disinfection of Muskellunge Eggs Under Intensive Culture in Hatcheries,
W80-03337 5A

Ohio River Basin Study--Comprehensive Survey: Volume VIII-Appendix G, Fish and Wildlife Resources.
W80-03574 6B

FISH PHYSIOLOGY
Cold Shock: Effect of Rate of Thermal Decrease on Atlantic Menhaden,
W80-03344 5C

FISH POPULATIONS
Investigations into the Effects of Volume of Water Flow, Quality of Feed and Type of Feeding on the Production of the Aischgrund Common Carp, Cyprinus Carpio, in Circular Concrete Ponds Under High Stocking Density Rates,
W80-03323 8I

FISHKILL
The Killing of Rush Creek,
W80-03318 5C

FLOOD
Floodflow Characteristics of Butternut Creek and Jamesville Reservoir, Jamesville, Onondaga County, New York,
W80-03488 2E

FLOOD CONTROL
Reservoir Storage Determination by Computer Simulation of Flood Control and Conservation Systems,
W80-03348 6A

Sizing Flood Control Reservoir Systems by Systems Analysis,
W80-03353 6A

Road De-Icing Salts in an Urban Stream and Flood Control Reservoir,
W80-03468 5B

Ohio River Basin Study--Comprehensive Survey: Volume XIV-Appendix M, Flood Control.
W80-03569 2E

Ohio River Basin Study--Comprehensive Survey: Volume IV-Appendix C, Hydrology.
W80-03578 2E

The Development and Servicing of Spatial Data Management Techniques in the Corps of Engineers,
W80-03588 6A

Flood Damage Assessments Using Spatial Data Management Techniques,
W80-03589 6A

Spatial Data Analysis of Nonstructural Measures,
W80-03590 6A

FLOOD DAMAGE
Flood Hazard Study, Little Calfpasture River -- Grassy Run, Augusta County, Virginia.
W80-03314 2E

Ohio River Basin Study--Comprehensive Survey: Volume XIV-Appendix M, Flood Control.
W80-03569 2E

The Development and Servicing of Spatial Data Management Techniques in the Corps of Engineers,
W80-03588 6A

Flood Damage Assessments Using Spatial Data Management Techniques,
W80-03589 6A

Spatial Data Analysis of Nonstructural Measures,
W80-03590 6A

FLOOD DAMAGE REDUCTION
The Canada Water Act Annual Report, 1978-1979.
W80-03583 6E

FLOOD INSURANCE
Type 16 Flood Insurance Study: Tsunami Predictions for the West Coast of the Continental United States,
W80-03556 2E

FLOOD PLAIN MANAGEMENT
The Development and Servicing of Spatial Data Management Techniques in the Corps of Engineers,
W80-03588 6A

Flood Damage Assessments Using Spatial Data Management Techniques,
W80-03589 6A

Spatial Data Analysis of Nonstructural Measures,
W80-03590 6A

FLOOD PLAINS
Flood Hazard Study, Little Calfpasture River -- Grassy Run, Augusta County, Virginia.
W80-03314 2E

FLOOD PROTECTION
Ohio River Basin Study--Comprehensive Survey: Volume XIV-Appendix M, Flood Control.
W80-03569 2E

Spatial Data Analysis of Nonstructural Measures,
W80-03590 6A

FLOODPLAINS
Floodplain and Wetlands Management (Final Rule).
W80-03406 6E

FLOODS
Flood Hydrograph and Peak Flow Frequency Analysis,
W80-03350 2A

A Hydrological Analysis of East Australian Floods Using Nimbus-5 Electrically Scanning Radiometer Data,
W80-03474 7B

Ohio River Basin Study--Comprehensive Survey: Volume IV-Appendix C, Hydrology.
W80-03578 2E

Very Large Floods in the Brahmaputra River in August 1962, Part I: Synoptic Aspects,
W80-03598 2B

FLORIDA
Hydrologic Records, Verna Well-Field Area, City of Sarasota, Florida, 1962-76--A Data Report,
W80-03485 7C

Characteristics of Four Urbanized Basins in South Florida,
W80-03486 7C

Water-Quality Data for Landfills, Hillsborough County, Florida, January 1974-October 1977,
W80-03489 5B

FLOW
Presentation of Longitudinal Dispersion Data,
W80-03379 2E

FLOW AROUND OBJECTS
Flow Past Fence in Turbulent Boundary Layer,
W80-03454 8B

FLOW CHARACTERISTICS
Floodflow Characteristics of Butternut Creek and Jamesville Reservoir, Jamesville, Onondaga County, New York,
W80-03488 2E

FLOW SEPARATION
Flow Past Fence in Turbulent Boundary Layer,
W80-03454 8B

FLUID MECHANICS
The Significance of the Root Mean Square Velocity Gradient and its Calculation in Devices for Water Treatment,
W80-03326 5F

FOAM SEPARATION
Process for the Separation of Foam from Effluents of Coke Oven Plants,
W80-03331 3E

FOOD HABITS
Studies on the Micro-Fauna of Blanket Bog with Particular Reference to Enchytraeidae. I. Field and Laboratory Tests of Micro-Organisms as Food,
W80-03531 2I

FORECASTING
Ohio River Basin Study--Comprehensive Survey: Volume III-Appendix B, Projective Economic Study.
W80-03579 6A

FOREST MANAGEMENT
Management of Pinus Pinaster Plantations on the Swan Coastal Plain for Timber and Water Yield,
W80-03385 2I

Dealing with Site Disturbances from Harvesting and Site Preparation in the Lower Coastal Plain,
W80-03503 4C

FOREST WATERSHEDS
Land-Use and Upland Water Resources in Britain--A Strategic Look,
W80-03363 2A

FORESTRY
Ohio River Basin Study--Comprehensive Survey: Volume VII-Appendix F, Agriculture.
W80-03575 6D

FRACTURES
Model for Estimating Electric Macroanisotropy Coefficient of Aquifers with Horizontal and Vertical Fractures,
W80-03434 2F

FREQUENCY ANALYSIS
Flood Damage Assessments Using Spatial Data Management Techniques,
W80-03589 6A

FRESHWATER MARSHES
Marsh Nesting by Mallards,
W80-03510 2I

Seasonal and Spatial Changes in the Composition of the Aquatic and Semiaquatic Vegetation of Lake Chilwa, Malawi,
W80-03512 2I

Ecology of Water-Level Manipulations on a Northern Marsh,
W80-03515 2I

Vegetation Study Undertaken at the Lamto Sau Savanna Reserve (Ivory Coast)--(Vegetationskundliche Untersuchungen Im Savannenreservat Lamto (Elfenbeinkuste)),
W80-03527 2I

Avian Ecology of a Managed Glacial Marsh,
W80-03529 2I

FUELS
Arid Lands Biomass Production in Arizona,
W80-03546 2I

FULVIC ACIDS
Humic and Fulvic Acids as Indicators of Soil and Water Pollution,
W80-03465 5A

FUNGI
Spartina Alterniflora Seed Fungi,
W80-03509 2I

FUNGICIDES
Saprolegnia: Control of Fungus on Incubating Eggs of Pink Salmon by Treatment with Seawater,
W80-03336 5A

GALILEE (ISRAEL)
Current Subsurface Intrusion of Mediterranean Seawater--A Possible Source of Groundwater Salinity in the Rift Valley System, Israel,
W80-03472 2A

GALVESTON BAY (TX)
Habitat Development Field Investigations, Bolivar Peninsula, Marsh and Upland Habitat Development Site, Galveston Bay, Texas; Summary Report,
W80-03402 5E

GASES
Gas Concentrations and Ages of Groundwaters in Beaufort Group Sediments, South Africa,
W80-03322 2F

GENERATORS
Shaft Torsional Oscillations of Hydrogenerators,
W80-03315 8C

GEOCHEMISTRY
Geology and Geochemistry of the Ship Creek and Monashka Creek Reservoirs, Southcentral Alaska,
W80-03304 2K

GEOGRAPHICAL REGIONS
Salt Marshes and Salt Deserts of the World,
W80-03504 2L

GEOHYDROLOGIC UNITS
Current Subsurface Intrusion of Mediterranean Seawater--A Possible Source of Groundwater Salinity in the Rift Valley System, Israel,
W80-03472 2A

The Paleohydrology of Southern Israel and Its Influence on the Flushing of the Kurnub and 'Arad Groups (Lower Cretaceous and Jurassic),
W80-03473 2A

GEOLOGIC CONTROL
Ohio River Basin Study--Comprehensive Survey: Volume VI-Appendix E, Groundwater.
W80-03576 2F

GEOMORPHOLOGY
Effects of Off-Road Vehicles on the Sediments of Hatches Harbor, Cape Cod National Seashore,
W80-03535 4C

GEORGIA
Operational Simulation of a Reservoir System with Pumped Storage,
W80-03351 6A

Phytoplankton Production in a Turbid, Temperate Salt Marsh Estuary,
W80-03372 2L

Water Resources Data for Georgia, Water Year 1978.
W80-03493 7C

GEOTHERMAL STUDIES
Geothermal Well Drilling Estimates Based on Past Well Costs,
W80-03427 6B

Well Drilling for +250F Water,
W80-03428 8A

The Effect of Salinity on Geothermal Well Performance,
W80-03430 8B

GERMANY
A Palaeoecological Study of Holocene Peat Bog Sections in Germany and the Netherlands, Based on the Analysis of Pollen, Spores and Macro- and Microscopic Remains of Fungi, Algae, Cormophytes and Animals,
W80-03525 2H

GOTA RIVER (SWEDEN)
Monitoring of Total Amount of Lipophilic Organo Chlorine Compounds in a Swedish River,
W80-03458 5B

GOVERNMENTAL INTERRELATIONS
The Growing Need for Federal-State Cooperation in Managing the Sea,
W80-03421 6E

Integrated Planning for Water Quality Management: The Federal Water Pollution Control Act Amendments of 1972 and Coastal Zone Management,
W80-03581 6E

GRASSLANDS
Waterfowl Pair Use of Natural and Man-Made Wetlands in South Dakota,
W80-03441 6G

Vegetation Study Undertaken at the Lamto Sau Savanna Reserve (Ivory Coast)--(Vegetationskundliche Untersuchungen Im Savannenreservat Lamto (Elfenbeinkuste)),
W80-03527 2I

GREAT DISMAL SWAMP (VA-NC)
Tree Rings as Indicators of Hydrologic Change in the Great Dismal Swamp, Virginia and North Carolina,
W80-03490 7B

GREAT LAKES
A Hydraulic Transient Model of the Upper St. Lawrence River for Water Resources Studies,
W80-03366 2E

Phosphorus Recycle and Chlorophyll in the Great Lakes,
W80-03388 5C

Determining Overwater Precipitation from Overland Data: The Methodological Controversy Analyzed,
W80-03392 2B

GROUND WATER
Safeguards for Groundwater,
W80-03422 6E

Executive Summary of the Report 'Surface Impoundments and the Effects of Ground Water Quality in the United States--A Preliminary Survey'.
W80-03424 5B

Twenty Years of Experience with Well-Water-Source Heat Pumps at Battelle's Columbus Laboratories,
W80-03425 8C

EPA's Hazardous-Waste Program: Will it Save our Ground Water,
W80-03431 5E

Migration of Radionuclide Chains in Ground Water,
W80-03433 5B

GROUND WATER RESOURCES
The Management of Ground Water Supplies,
W80-03435 4B

GROUNDWATER
Environmental Path of Arsenic in Groundwater,
W80-03303 5B

Gas Concentrations and Ages of Groundwaters in Beaufort Group Sediments, South Africa,
W80-03322 2F

Better Utilization of Ground Water in the Piedmont and Mountain Region of the Southeast,
W80-03327 6D

Theis Parameter Evaluation from Pumping Tests by Sensitivity Analysis,
W80-03357 2F

Resistivity Investigations for Ground Water in Metamorphic Areas Near Dhanbad, India,

Ohio River Basin Study--Comprehensive Survey: Volume VI-Appendix E, Groundwater.
W80-03576 2F

GROWTH RATES
Laboratory Observations on the Influence of Temperature and Salinity on Development of the Eggs and Growth of the Larvae of Solea Solea (Pisces),
W80-03329 5A

GULF OF MEXICO
Hypsometry of the Continental Shelf off Eastern North America,
W80-03367 2L

GULLS
The Immediate Effects of Ditching a Saltmarsh on Nesting Herring Gulls Larus Argentatus,
W80-03520 4A

HABITAT
Avian Ecology of a Managed Glacial Marsh,
W80-03529 2I

HABITAT DEVELOPMENT
Habitat Development Field Investigations, Buttermilk Sound Marsh Development Site, Atlantic Intracoastal Waterway, Georgia: Appendix A: Propagation of Marsh Plants and Post-Propagation Monitoring,
W80-03399 5E

Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia: Appendix F: Environmental Impacts of Marsh Development with Dredged Material: Sediment and Water Quality,
W80-03400 5E

Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia, Appendix E: Environmental Impacts of Marsh Development with Dredged Material: Metals and Chlorinated Hydrocarbon Compounds in Marsh Soils and Vascular Plant Tissues,
W80-03401 5E

HABITATS
Zinc--A Major Inorganic Component of Nereid Polychaete Jaws,
W80-03341 5B

Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia: Appendix F: Environmental Impacts of Marsh Development with Dredged Material: Sediment and Water Quality,
W80-03400 5E

Habitat Development Field Investigations, Bolivar Peninsula, Marsh and Upland Habitat Development Site, Galveston Bay, Texas; Summary Report,
W80-03402 5E

Habitat Development Field Investigations, Salt Pond No. 3 Marsh Development Site, South San Francisco Bay, California; Summary Report,
W80-03555 4A

HAITI
Drainage and Larviciding for Control of a Malaria Focus in Haiti,
W80-03505 4C

HALOGENS
The Placing of the Disinfection Stage in a Reclamation Plant to Reduce Haloform Formation,
W80-03324 5F

HALOPHYTES
Production and Structure in the Early Stages of Vegetation Development in the Lauwerszee-Polder,
W80-03524 2L

HARPACTICOIDES
Meiofauna Development on Artificial Soft Bottoms in Kiel Bay (In German),
W80-03346 5A

HAWAII
Record Torrential Rainstorms on the Island of Hawaii, January-February 1979,
W80-03475 2B

HAZARDS
EPA's Hazardous-Waste Program: Will it Save our Ground Water,
W80-03431 5E

HEAD LOSS
Head-Loss Measurements on Hydroelectric Conduits,
W80-03453 8B

HEAT EXCHANGERS
Well Drilling for +250F Water,
W80-03428 8A

HEAT PUMPS
Twenty Years of Experience with Well-Water-Source Heat Pumps at Battelle's Columbus Laboratories,
W80-03425 8C

HEAVY METALS
Two Heavy Metal-Binding Proteins in the Midgut Gland of the Crab Carcinus Maenas,
W80-03339 5B

Distribution of Metals in Street Sweepings, Stormwater Solids, and Urban Aquatic Sediments,
W80-03543 5B

HERBICIDES
Triazine Residues in a Watershed in Southwestern Ontario (1973-75),
W80-03389 5B

HILLSBOROUGH COUNTY (FLA)
Water-Quality Data for Landfills, Hillsborough County, Florida, January 1974-October 1977,
W80-03489 5B

HISTORIC FLOODS
Flood Hazard Study, Little Calfpasture River -- Grassy Run, Augusta County, Virginia.
W80-03314 2E

HISTORY
Archeological Investigations Along the Salt-Gila Aqueduct,
W80-03321 6B

A Palaeoecological Study of Holocene Peat Bog Sections in Germany and the Netherlands, Based on the Analysis of Pollen, Spores and Macro- and Microscopic Remains of Fungi, Algae, Cormophytes and Animals,
W80-03525 2H

Mires of the Manapouri-Te Anau Lowlands,
W80-03528 2I

HOUSTON (TX)
Use of Synographic Techniques in Research and Dissemination of Hydrological Information,
W80-03360 7C

HUMIC ACIDS
Resin Treatment Improves High-Color Ground Water,
W80-03436 5F

Humic and Fulvic Acids as Indicators of Soil and Water Pollution,
W80-03465 5A

HUNTING
Ohio River Basin Study--Comprehensive Survey: Volume VIII-Appendix G, Fish and Wildlife Resources.
W80-03574 6B

HYDRAULIC GRADIENT
An Analysis of Infiltration in Initial Gradient Soils,
W80-03600 2G

HYDRAULIC MODELS
Side-Channel Spillway and Outlet Works for San Antonio Dam; Hydraulic Model Investigation,
W80-03394 8B

Vortex Problem at Intake, Lower St. Anthony Falls Lock and Dam, Mississippi River, Minneapolis, Minnesota; Hydraulic Model Investigation,
W80-03557 8A

Terminal Island Sewage Treatment Plant Outfall, Los Angeles Harbor, California; Hydraulic Model Investigation,
W80-03560 5E

Filling and Emptying System, New Ship Lock, Mississippi River-Gulf Outlet, Louisiana; Hydraulic Model Investigation,
W80-03561 8A

Outlet Structure for Meramec Lake, Meramec River, Missouri; Hydraulic Model Investigation,
W80-03563 8A

HYDRAULIC SYSTEMS
The Significance of the Root Mean Square Velocity Gradient and its Calculation in Devices for Water Treatment,
W80-03326 5F

HYDRODYNAMICS
The Significance of the Root Mean Square Velocity Gradient and its Calculation in Devices for Water Treatment,
W80-03326 5F

HYDROELECTRIC CONDUITS
Head-Loss Measurements on Hydroelectric Conduits,
W80-03453 8B

HYDROELECTRIC PLANTS
Shaft Torsional Oscillations of Hydrogenerators,
W80-03315 8C

HYDROGEOLOGY
Geology and Geochemistry of the Ship Creek and Monashka Creek Reservoirs, Southcentral Alaska,
W80-03304 2K

Gas Concentrations and Ages of Groundwaters in Beaufort Group Sediments, South Africa,
W80-03322 2F

HYDROGRAPH ANALYSIS
Flood Hydrograph and Peak Flow Frequency Analysis,
W80-03350 2A

The Application of Hydrologic Models to Small Watersheds Having Mild Topography,
W80-03469 2B

HYDROLOGIC DATA
Hydrologic Data from a Deep Test Well, City of Sarasota, Florida,
W80-03482 5D

Hydrologic Records, Verna Well-Field Area, City of Sarasota, Florida, 1962-76--A Data Report,
W80-03485 7C

Characteristics of Four Urbanized Basins in South Florida,
W80-03486 7C

Water Resources Data for New Hampshire and Vermont, Water Year 1978.
W80-03491 7C

Water Resources Data for Maine, Water Year 1978.
W80-03492 7C

Water Resources Data for Georgia, Water Year 1978.
W80-03493 7C

Water Resources Data for Pennsylvania, Water Year 1978--Volume 1. Delaware River Basin.
W80-03496 7C

Water Resources Data for Pennsylvania, Water Year 1978--Volume 2. Susquehanna and Potomac River Basins.
W80-03497 7C

Water Resources Data for Pennsylvania, Water Year 1978--Volume 3. Ohio River and St. Lawrence River Basins.
W80-03498 7C

Ohio River Basin Study--Comprehensive Survey: Volume IV-Appendix C, Hydrology.
W80-03578 2E

HYDROLOGIC MODELING
The Application of Hydrologic Models to Small Watersheds Having Mild Topography,
W80-03469 2B

HYDROLOGIC STUDIES
Ohio River Basin Study--Comprehensive Survey: Volume IV-Appendix C, Hydrology.
W80-03578 2E

W80-03457 5C

The Effect of Wastewater Phosphorus Removal on Shagawa Lake, Minnesota: Phosphorus Supplies, Lake Phosphorus and Chlorophyll A,
W80-03459 5C

Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-Iri Bay of Lake Kasumigaura, Japan--I. Nutrient Influx and Phytoplankton Bloom,
W80-03467 5A

Effect of Sediment Control Dams on the Water Quality of a Prairie Lake,
W80-03477 4D

Seasonal and Spatial Changes in the Composition of the Aquatic and Semiaquatic Vegetation of Lake Chilwa, Malawi,
W80-03512 2I

The Contribution of Macrophytes to the Metalimnetic Oxygen Maximum in a Montane, Oligotrophic Lake,
W80-03533 2I

LAND CLASSIFICATION
Hydrologic Land Use Classification Using Landsat,
W80-03347 7B

Ohio River Basin Study--Comprehensive Survey: Volume VII-Appendix F, Agriculture.
W80-03575 6D

LAND MANAGEMENT
Nationalizing Lake Tahoe.
W80-03419 6E

LANDFILLS
Water-Quality Data for Landfills, Hillsborough County, Florida, January 1974-October 1977,
W80-03489 5B

Investigation of Sanitary Landfill Behavior, Volume I. Final Report,
W80-03567 5B

LARVICIDES
Drainage and Larviciding for Control of a Malaria Focus in Haiti,
W80-03505 4C

LAW OF THE SEA
United States Ocean Mineral Resource Interests and the United Nations Conference on the Law of the Sea,
W80-03415 6E

The Third United Nations Conference on the Law of the Sea: The Seventh Session (1978),
W80-03500 6E

LEACHATE
Investigation of Sanitary Landfill Behavior, Volume I. Final Report,
W80-03567 5B

LEACHATES
Confined Disposal Area Effluent and Leachate Control (Laboratory and Field Investigations),
W80-03398 5E

LEAD
Two Heavy Metal-Binding Proteins in the Midgut Gland of the Crab Carcinus Maenas,
W80-03339 5B

LEGISLATION
Water Resources Committee (Annual Report): Survey of Wyoming Water Law 1975-78.
W80-03404 6E

Water Resources Committee Report on Water Law Developments,
W80-03413 6E

The Canada Water Act Annual Report, 1978-1979.
W80-03583 6E

LIME
Alumina-Lime-Soda Pilot Plant Testing at the U.S. Bureau of Reclamation Desalting Test Station at Yuma, Arizona,
W80-03307 5F

LIMESTONES
Effects of Limestone Strip Mining on Benthic Macroinvertebrate Communities,
W80-03460 5C

LINEAR PROGRAMMING
An Urban Runoff Model for Tulsa, Oklahoma,
W80-03582 6A

LIQUID WASTES
Hydrologic Data from a Deep Test Well, City of Sarasota, Florida,
W80-03482 5D

LOCKS
Vortex Problem at Intake, Lower St. Anthony Falls Lock and Dam, Mississippi River, Minneapolis, Minnesota; Hydraulic Model Investigation,
W80-03557 8A

Filling and Emptying System, New Ship Lock, Mississippi River-Gulf Outlet, Louisiana; Hydraulic Model Investigation,
W80-03561 8A

LODI (NJ)
Distribution of Metals in Street Sweepings, Stormwater Solids, and Urban Aquatic Sediments,
W80-03543 5B

LONG BEACH HARBOR (CALIF)
Terminal Island Sewage Treatment Plant Outfall, Los Angeles Harbor, California; Hydraulic Model Investigation,
W80-03560 5E

LONG-TERM PLANNING
Planning for Development of Groundwater and Surface Water Resources,
W80-03450 2E

LONGITUDINAL DISPERSION
Presentation of Longitudinal Dispersion Data,
W80-03379 2E

LOS ANGELES HARBOR (CALIF)
Terminal Island Sewage Treatment Plant Outfall, Los Angeles Harbor, California; Hydraulic Model Investigation,
W80-03560 5E

LOUISIANA
Developing Management Guidelines for Oil and Gas Activities: The Louisiana Experience,
W80-03418 6E

LUMBERING
Dealing with Site Disturbances from Harvesting and Site Preparation in the Lower Coastal Plain,
W80-03503 4C

LYSIMETERS
An Improved Weighing Lysimeter Facility for Citrus Evapotranspiration Studies,
W80-03325 2D

MAINE
Water Resources Data for Maine, Water Year 1978.
W80-03492 7C

MALACHITE GREEN
Saprolegnia: Control of Fungus on Incubating Eggs of Pink Salmon by Treatment with Seawater,
W80-03336 5A

MALI
Biogeographical Considerations of Colonization of the Lower Tilemsi Valley in the Second Millenium B.C.,
W80-03553 2A

MALLARD DUCK
Marsh Nesting by Mallards,
W80-03510 2I

MANAGEMENT
Floodplain and Wetlands Management (Final Rule).
W80-03406 6E

Consistency for Department of the Interior Outer Continental Shelf (OCS) Prelease Sale Activities and for Other Federal Activities Directly Affecting the Coastal Zone (Final Rule).
W80-03408 6E

MANAGEMENT ALTERNATIVES
Disposal of Dredged Material Within the New York District: Volume I-Present Practices and Candidate Alternatives,
W80-03586 5B

MAPPING
Use of Synographic Techniques in Research and Dissemination of Hydrological Information,
W80-03360 7C

MAPS
Proximity of Pipelines and Storage Facilities for Gas and Oil to Major Aquifers in Connecticut,
W80-03479 7C

Proximity of Agricultural Areas to Major Aquifers in Connecticut,
W80-03480 7C

Map Showing Ground-Water Conditions in the Bodaway Mesa Area, Coconino County, Arizona--1977,
W80-03481 7C

MARINE FISH
Laboratory Observations on the Influence of Temperature and Salinity on Development of the Eggs and Growth of the Larvae of Solea Solea (Pisces),
W80-03329 5A

Total Mercury Content in Some Marine Fish from the Indian Ocean,
W80-03343 5B

MARSH MANAGEMENT
The National Estuarine Sanctuary Program,
W80-03416 6E

The Effects of Waterfowl Management Practices on Mosquito Abundance and Distribution in Louisiana Coastal Marshes,
W80-03511 6G

Avian Ecology of a Managed Glacial Marsh,
W80-03529 2I

MARSH PLANTS
Species Versatility in Shore Habitats,
W80-03521 2I

Effects of Off-Road Vehicles on Plants of a Northern Marsh,
W80-03536 4C

Habitat Development Field Investigations, Salt Pond No. 3 Marsh Development Site, South San Francisco Bay, California; Summary Report,
W80-03555 4A

MARSHES
Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia, Appendix E: Environmental Impacts of Marsh Development with Dredged Material: Metals and Chlorinated Hydrocarbon Compounds in Marsh Soils and Vascular Plant Tissues,
W80-03401 5E

Habitat Development Field Investigations, Bolivar Peninsula, Marsh and Upland Habitat Development Site, Galveston Bay, Texas; Summary Report,
W80-03402 5E

MASONBORO INLET (NC)
South Jetty Stability Study, Masonboro Inlet, North Carolina: Hydraulic Model Investigation,
W80-03397 8B

MATHEMATICAL MODELS
Identification of Aquifer Parameters Using Numerical Techniques,
W80-03305 2F

The Relationship Between the Time Bases of Simulation Models and Their Structure,
W80-03359 2E

The Effects of Drought on the River Systems,
W80-03448 2A

Aggradation in Streams Due to Overloading,
W80-03452 2J

Type 16 Flood Insurance Study: Tsunami Predictions for the West Coast of the Continental United States,
W80-03556 2E

Numerical Simulation of the Coos Bay-South Slough Complex,
W80-03559 2L

Feasibility Study of a Numerical Tow Model,
W80-03562 8B

Maximum Utilization of Water Resources in a Planned Community -- Application of the Storm Water Management Model, Volume I,
W80-03565 4A

An Approach to the Construction of the Regional Water Resource Model,
W80-03587 6A

MATHEMATICAL MODES
An Urban Runoff Model for Tulsa, Oklahoma,
W80-03582 6A

MAXIMUM PROBABLE FLOOD
Floodflow Characteristics of Butternut Creek and Jamesville Reservoir, Jamesville, Onondaga County, New York,
W80-03488 2E

MEASUREMENT
An Automatic Range-Switching Modification for Direct-Reading Specific Conductance Measurements,
W80-03328 7B

MEDINA
Dams Around the Holy City of Medina, and the Pressure on Its Water Supply,
W80-03549 6B

MEDITERRANEAN SEA
On Man-Induced Variations in the Circulation of the Mediterranean Sea,
W80-03354 2L

MEMBRANES
Performance Evaluation of Water Harvesting Catchments,
W80-03552 3B

MERAMEC LAKE (MO)
Outlet Structure for Meramec Lake, Meramec River, Missouri; Hydraulic Model Investigation,
W80-03563 8A

MERCURY
Total Mercury Content in Some Marine Fish from the Indian Ocean,
W80-03343 5B

METALS
Trace Element release from Estuarine Sediments of South Mosquito Lagoon Near Kennedy Space Center,
W80-03355 5A

Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia, Appendix E: Environmental Impacts of Marsh Development with Dredged Material: Metals and Chlorinated Hydrocarbon Compounds in Marsh Soils and Vascular Plant Tissues,
W80-03401 5E

Aerial Inputs of Cadmium, Copper, Lead, and Manganese into a Freshwater Pond in the Vicinity of a Coal-Fired Power Plant,
W80-03466 5A

METEOROLOGY
Hydrometeorological Model for Streamflow Prediction,
W80-03487 2A

METHODOLOGY
Downhole Pumps for Water Sampling in Small-Diameter Wells,
W80-03483 8C

METHYLMERCURY
Total Mercury Content in Some Marine Fish from the Indian Ocean,
W80-03343 5B

MICHIGAN
Determining Peak-Discharge Frequencies in an Urbanizing Watershed--A Case Study,
W80-03349 2A

MICROBIAL DEGRADATION
Distribution, Abundance, and Petroleum-Degrading Potential of Marine Bacteria from Middle Atlantic Continental Shelf Waters,
W80-03538 5C

MICROORGANISMA
Biogenic Structure and Its Effect on the Spatial Heterogeneity of Meiofauna in a Salt Marsh,
W80-03519 2I

MID-ATLANTIC STATES
An Analysis of Water Resources Constraints on Power Plant Siting in the Mid-Atlantic States,
W80-03361 6D

MIDGUT GLAND
Two Heavy Metal-Binding Proteins in the Midgut Gland of the Crab Carcinus Maenas,
W80-03339 5B

MIGRATION
Migration of Radionuclide Chains in Ground Water,
W80-03433 5B

MIGRATIONS
Biogeographical Considerations of Colonization of the Lower Tilemsi Valley in the Second Millenium B.C.,
W80-03553 2A

MINEROLOGY
Dowsing Achieves New Credence,
W80-03432 7B

MINNESOTA
The Killing of Rush Creek,
W80-03318 5C

The Effect of Wastewater Phosphorus Removal on Shagawa Lake, Minnesota: Phosphorus Supplies, Lake Phosphorus and Chlorophyll A,
W80-03459 5C

MINNOWS
Evaluation of Cutrine for Use in Fish Culture,
W80-03335 5A

MISSISSIPPI
The Coffee Sand and Ripley Aquifers in Mississippi,
W80-03484 2F

MISSISSIPPI RIVER
Benthic Invertebrates of the Lower Mississippi River,
W80-03333 5A

MISSISSIPPI RIVER-GULF OUTLET (LA)
Filling and Emptying System, New Ship Lock, Mississippi River-Gulf Outlet, Louisiana; Hydraulic Model Investigation,
W80-03561 8A

MIXING
The Significance of the Root Mean Square Velocity Gradient and its Calculation in Devices for Water Treatment,
W80-03326 5F

Longitudinal Dispersion in Rivers,
W80-03378 5B

MODEL STUDIES
A Dynamic Regional Impact Analysis of Federal Expenditures of a Water and Related Land Resource Project -- The Boise Project of Idaho, Part III: Economic Scenario of the Boise Region 'Without' a Federal Irrigation Project, Economics Subproject,
W80-03311 6B

Reservoir Storage Determination by Computer Simulation of Flood Control and Conservation Systems,
W80-03348 6A

Testing of Several Runoff Models on an Urban Watershed,
W80-03352 2A

Theis Parameter Evaluation from Pumping Tests by Sensitivity Analysis,
W80-03357 2F

A Hydraulic Transient Model of the Upper St. Lawrence River for Water Resources Studies,
W80-03366 2E

Longitudinal Dispersion in Rivers,
W80-03378 5B

Presentation of Longitudinal Dispersion Data,
W80-03379 2E

Thermal Predictions Using Integral Energy Model,
W80-03380 2H

Meteorological Aspects of the 1975-76 Drought,
W80-03445 2E

Flow Past Fence in Turbulent Boundary Layer,
W80-03454 8B

A Systems Model of Stream Flow and Water Quality in the Bedford-Ouse River--1. Stream Flow Modelling,
W80-03456 2E

One-Dimensional Transient Model for Short-Term Prediction of Downstream Pollution in Rivers,
W80-03461 5B

The Application of Hydrologic Models to Small Watersheds Having Mild Topography,
W80-03469 2B

Use of Environmental Data in Assessing the Quality of Irrigation Water,
W80-03471 5G

Hydrometeorological Model for Streamflow Prediction,
W80-03487 2A

Floodflow Characteristics of Butternut Creek and Jamesville Reservoir, Jamesville, Onondaga County, New York,
W80-03488 2E

Water Resources of the Nisqually Lake Area, Pierce County, Washington,
W80-03494 2A

Application of Operations Research Techniques for a Problem in Water Resources Management: Economic Appraisal of Changes in Water Use Induced by Investments into Navigable Rivers and Canals,
W80-03501 6A

Evapotranspiration From an Arid Zone Plant Community,
W80-03548 2D

An Urban Runoff Model for Tulsa, Oklahoma,
W80-03582 6A

The Development and Servicing of Spatial Data Management Techniques in the Corps of Engineers,
W80-03588 6A

Spatial Data Analysis of Nonstructural Measures,
W80-03590 6A

An Analysis of Infiltration in Initial Gradient Soils,
W80-03600 2G

MODELING SYSTEMS
An Approach to the Construction of the Regional Water Resource Model,
W80-03587 6A

MODELS
Ohio River Basin Study--Comprehensive Survey: Volume III-Appendix B, Projective Economic Study.
W80-03579 6A

An Urban Runoff Model for Tulsa, Oklahoma,
W80-03582 6A

An Approach to the Construction of the Regional Water Resource Model,
W80-03587 6A

MONASHKA (ALASKA)
Geology and Geochemistry of the Ship Creek and Monashka Creek Reservoirs, Southcentral Alaska,
W80-03304 2K

MONITORING
Monitoring of Total Amount of Lipophilic Organo Chlorine Compounds in a Swedish River,
W80-03458 5B

MONSOONS
Very Large Floods in the Brahmaputra River in August 1962, Part I: Synoptic Aspects,
W80-03598 2B

MOSQUITOES
Drainage and Larviciding for Control of a Malaria Focus in Haiti,
W80-03505 4C

The Effects of Waterfowl Management Practices on Mosquito Abundance and Distribution in Louisiana Coastal Marshes,
W80-03511 6G

MUDFLATS
Seasonal Shifts of Sediment Within an Estuary Mediated by Algal Growth,
W80-03374 2J

MULTIPLE PURPOSE PROJECTS
Ohio River Basin Study--Comprehensive Survey: Volume XIV-Appendix M, Flood Control.
W80-03569 2E

Ohio River Basin Study--Comprehensive Survey: Volume XIII-Appendix L, Navigation.
W80-03570 6B

Ohio River Basin Study--Comprehensive Survey: Volume XII-Appendix K, Development Program Formulation.
W80-03571 6B

Ohio River Basin Study--Comprehensive Survey: Volume IX-Appendix H, Outdoor Recreation.
W80-03573 6B

Ohio River Basin Study--Comprehensive Survey: Volume VIII-Appendix G, Fish and Wildlife Resources.
W80-03574 6B

Ohio River Basin Study--Comprehensive Survey: Volume VII-Appendix F, Agriculture.
W80-03575 6D

Ohio River Basin Study--Comprehensive Survey: Volume V-Appendix D, Water Supply and Water Pollution Control.
W80-03577 5G

Ohio River Basin Study--Comprehensive Survey: Volume IV-Appendix C, Hydrology.
W80-03578 2E

Ohio River Basin--Comprehensive Survey: Volume II-Appendix A, History of Study.
W80-03580 6D

MUNICIPAL WATER
Municipal Water Use,
W80-03551 6D

NARRAGANSETT BAY (RI)
Tracer Study of Sediment-Water Interactions in Estuaries,
W80-03368 2J

NATAL (SOUTH AFRICA)
Use of Environmental Data in Assessing the Quality of Irrigation Water,
W80-03471 5G

NATIONAL ECONOMIC DEVELOPMENT
Socio-Economic Changes and Development of Water Resources in Saudi Arabia,
W80-03502 6D

NAVIGABLE RIVERS
Application of Operations Research Techniques for a Problem in Water Resources Management: Economic Appraisal of Changes in Water Use Induced by Investments into Navigable Rivers and Canals,
W80-03501 6A

Ohio River Basin Study--Comprehensive Survey: Volume XIII-Appendix L, Navigation.
W80-03570 6B

NAVIGATION
Ohio River Basin Study--Comprehensive Survey: Volume XIII-Appendix L, Navigation.
W80-03570 6B

NEGEV (ISRAEL)
The Paleohydrology of Southern Israel and Its Influence on the Flushing of the Kurnub and 'Arad Groups (Lower Cretaceous and Jurassic), W80-03473 2A

NESTING
Marsh Nesting by Mallards, W80-03510 2I

The Immediate Effects of Ditching a Saltmarsh on Nesting Herring Gulls Larus Argentatus, W80-03520 4A

NETHERLANDS
Production and Structure in the Early Stages of Vegetation Development in the Lauwerszee-Polder, W80-03524 2L

A Palaeoecological Study of Holocene Peat Bog Sections in Germany and the Netherlands, Based on the Analysis of Pollen, Spores and Macro- and Microscopic Remains of Fungi, Algae, Cormophytes and Animals, W80-03525 2H

NEVADA
Nationalizing Lake Tahoe. W80-03419 6E

NEW HAMPSHIRE
Water Resources Data for New Hampshire and Vermont, Water Year 1978. W80-03491 7C

NEW JERSEY
Distribution of Metals in Street Sweepings, Stormwater Solids, and Urban Aquatic Sediments, W80-03543 5B

NEW SHIP LOCK (LA)
Filling and Emptying System, New Ship Lock, Mississippi River-Gulf Outlet, Louisiana; Hydraulic Model Investigation, W80-03561 8A

NEW YORK
Disposal of Dredged Material Within the New York District: Volume I-Present Practices and Candidate Alternatives, W80-03586 5B

NEW ZEALAND
Mires of the Manapouri-Te Anau Lowlands, W80-03528 2I

NILE RIVER
On Man-Induced Variations in the Circulation of the Mediterranean Sea, W80-03354 2L

NISQUALLY LAKE AREA (WASH)
Water Resources of the Nisqually Lake Area, Pierce County, Washington, W80-03494 2A

NONSTRUCTURAL ALTERNATIVES
Spatial Data Analysis of Nonstructural Measures, W80-03590 6A

NORTH AMERICA
Hypsometry of the Continental Shelf off Eastern North America, W80-03367 2L

NORTH CAROLINA
Coastal Colloidal Carbon: A Study of its Seasonal Variation and the Possibility of River Input, W80-03375 2L

NORTH CASCADES REGION (WASH)
Hydrometeorological Model for Streamflow Prediction, W80-03487 2A

NORTHEAST U.S.
Wild River Inventory, W80-03317 6E

An Analysis of Water Resources Constraints on Power Plant Siting in the Mid-Atlantic States, W80-03361 6D

NUCLEAR POWERPLANTS
The Economic Feasibility of Dual Purpose Nuclear Desalination of Ground Water, W80-03544 3A

NUMERICAL SIMULATION
Numerical Simulation of the Coos Bay-South Slough Complex, W80-03559 2L

NUTRIENTS
Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-Iri Bay of Lake Kasumigaura, Japan--I. Nutrient Influx and Phytoplankton Bloom, W80-03467 5A

Vegetation and Nutrient Status of Northern Michigan Fens, W80-03523 2I

Changes in Decomposition Rate, Microbial Population and Carbohydrate Content of an Acid Peat Bog After Liming and Reclamation, W80-03534 2G

OCEAN DUMPING
Disposal of Dredged Material Within the New York District: Volume I-Present Practices and Candidate Alternatives, W80-03586 5B

OCEANS
The Growing Need for Federal-State Cooperation in Managing the Sea, W80-03421 6E

OFF-ROAD VEHICLES
Effects of Off-Road Vehicles on the Sediments of Hatches Harbor, Cape Cod National Seashore, W80-03535 4C

Effects of Off-Road Vehicles on Plants of a Northern Marsh, W80-03536 4C

OGALLALA AQUIFER (TX)
Analytical Study of the Ogallala Aquifer in Carson County, Texas, Projections of Saturated Thickness, Volume of water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields, W80-03451 7C

OHIO RIVER
Ohio River Basin--Comprehensive Survey: Volume II-Appendix A, History of Study. W80-03580 6D

OHIO RIVER BASIN
Ohio River Basin Study--Comprehensive Survey: Volume XIV-Appendix M, Flood Control. W80-03569 2E

Ohio River Basin Study--Comprehensive Survey: Volume XIII-Appendix L, Navigation. W80-03570 6B

Ohio River Basin Study--Comprehensive Survey: Volume XII-Appendix K, Development Program Formulation. W80-03571 6B

Ohio River Basin Study--Comprehensive Survey: Volume X-Appendix I, Electric Power. W80-03572 6B

Ohio River Basin Study--Comprehensive Survey: Volume IX-Appendix H, Outdoor Recreation. W80-03573 6B

Ohio River Basin Study--Comprehensive Survey: Volume VIII-Appendix G, Fish and Wildlife Resources. W80-03574 6B

Ohio River Basin Study--Comprehensive Survey: Volume VII-Appendix F, Agriculture. W80-03575 6D

Ohio River Basin Study--Comprehensive Survey: Volume VI-Appendix E, Groundwater. W80-03576 2F

Ohio River Basin Study--Comprehensive Survey: Volume V-Appendix D, Water Supply and Water Pollution Control. W80-03577 5G

Ohio River Basin Study--Comprehensive Survey: Volume IV-Appendix C, Hydrology. W80-03578 2E

Ohio River Basin Study--Comprehensive Survey: Volume III-Appendix B, Projective Economic Study. W80-03579 6A

OHIO RIVER BASIN (PA)
Water Resources Data for Pennsylvania, Water Year 1978--Volume 3. Ohio River and St. Lawrence River Basins. W80-03498 7C

OIL DISPERSANTS
Fundamental Studies on the Influence of Oil Pollution Upon Marine Organisms--IV the Toxicity of Mixtures of Oil Products and Oil-Spill Emulsifiers to Phytoplankton (In Japanese), W80-03338 5C

OIL POLLUTION
Fundamental Studies on the Influence of Oil Pollution Upon Marine Organisms--IV the Toxicity of Mixtures of Oil Products and Oil-Spill Emulsifiers to Phytoplankton (In Japanese), W80-03338 5C

Washer/Separator System for Drilling Cuttings in Water Environment Oil Wells, W80-03530 5G

Distribution, Abundance, and Petroleum-Degrading Potential of Marine Bacteria from Middle Atlantic Continental Shelf Waters, W80-03538 5C

Effects of Sublethal Oil Concentrations on the Copepod, Nitocra Affinis, W80-03540 5C

Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. I: American Oysters and Brown Shrimp, W80-03541 5C

Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. II: Striped Mullet, W80-03542 5C

Floating-Type Anti-Oil, Anti-Impact and Anti-Wave Barrier, W80-03593 5G

ON-SITE TESTS
Meiofauna Development on Artificial Soft Bottoms in Kiel Bay (In German), W80-03346 5A

Overflow Tests Analysed by Theoretical and Numerical Methods, W80-03356 2F

ONONDAGA COUNTY (NY)
Floodflow Characteristics of Butternut Creek and Jamesville Reservoir, Jamesville, Onondaga County, New York,
W80-03488 2E

OPERATIONS RESEARCH
Application of Operations Research Techniques for a Problem in Water Resources Management: Economic Appraisal of Changes in Water Use Induced by Investments into Navigable Rivers and Canals,
W80-03501 6A

OPTIMIZATION
Sizing Flood Control Reservoir Systems by Systems Analysis,
W80-03353 6A

ORGANIC COMPOUNDS
Accumulation, Elimination, and Metabolism of Dichlorobenzidine in the Bluegill Sunfish,
W80-03334 5B

Effects of Organic Compounds on Amphibian Reproduction,
W80-03438 5C

Distribution, Abundance, and Petroleum-Degrading Potential of Marine Bacteria from Middle Atlantic Continental Shelf Waters,
W80-03538 5C

ORGANIC WASTES
Organic Qualities of Groundwaters,
W80-03437 5A

OUTDOOR RECREATION
Ohio River Basin Study--Comprehensive Survey: Volume IX-Appendix H, Outdoor Recreation.
W80-03573 6B

OUTER CONTINENTAL SHELF
Distribution, Abundance, and Petroleum-Degrading Potential of Marine Bacteria from Middle Atlantic Continental Shelf Waters,
W80-03538 5C

Effects of Sublethal Oil Concentrations on the Copepod, Nitocra Affinis,
W80-03540 5C

Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. I: American Oysters and Brown Shrimp,
W80-03541 5C

Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. II: Striped Mullet,
W80-03542 5C

OUTFALL SEWERS
Terminal Island Sewage Treatment Plant Outfall, Los Angeles Harbor, California; Hydraulic Model Investigation,
W80-03560 5E

OUTLET WORKS
Side-Channel Spillway and Outlet Works for San Antonio Dam; Hydraulic Model Investigation,
W80-03394 8B

Outlet Structure for Meramec Lake, Meramec River, Missouri; Hydraulic Model Investigation,
W80-03563 8A

OXIDATION
Process for Catalytic Photo-Oxidation of Water,
W80-03440 1A

OYSTERS
Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. I: American Oysters and Brown Shrimp,
W80-03541 5C

OZONE
The Placing of the Disinfection Stage in a Reclamation Plant to Reduce Haloform Formation,
W80-03324 5F

PACIFIC OCEAN
Community Structure and Seasonal Variation in Intertidal Panamanian Sandy Beaches,
W80-03376 2L

PALEOCLIMATOLOGY
Biogeographical Considerations of Colonization of the Lower Tilemsi Valley in the Second Millenium B.C.,
W80-03553 2A

PALEOHYDROLOGY
The Paleohydrology of Southern Israel and Its Influence on the Flushing of the Kurnub and 'Arad Groups (Lower Cretaceous and Jurassic),
W80-03473 2A

Dams Around the Holy City of Medina, and the Pressure on Its Water Supply,
W80-03549 6B

PALYNOLOGY
A Palaeoecological Study of Holocene Peat Bog Sections in Germany and the Netherlands, Based on the Analysis of Pollen, Spores and Macro- and Microscopic Remains of Fungi, Algae, Cormophytes and Animals,
W80-03525 2H

PANAMA
Community Structure and Seasonal Variation in Intertidal Panamanian Sandy Beaches,
W80-03376 2L

PATENTS
Water Purifier System and Valve,
W80-03310 5F

Process for the Separation of Foam from Effluents of Coke Oven Plants,
W80-03331 3E

Apparatus and Method for Treatment of Fluid with Ozone,
W80-03332 5F

Process for Soluble Cyanide Removal from Wastewater Streams,
W80-03362 5D

Anti-Corrosion Composition for Use in Aqueous Systems,
W80-03409 5G

Method Means for De-Silting Water,
W80-03410 5G

Method and Apparatus for Recovering Liquid and Solid Constituents of Water Solutions Containing Sparingly Soluble Solids,
W80-03414 5D

Water Purification Method and Apparatus,
W80-03426 5D

Process for Catalytic Photo-Oxidation of Water,
W80-03440 1A

Desalinization and Chemical Extraction Process,
W80-03464 3A

Device for Automatic, Selective Watering of Plants,
W80-03506 3F

Ice Thickness Indicator,
W80-03513 2C

Centrifugal Water Oil Separator,
W80-03522 5G

Washer/Separator System for Drilling Cuttings in Water Environment Oil Wells,
W80-03530 5G

Purification of Waste Streams Containing Available Chlorine,
W80-03539 5D

Method of Generating Hydrogen and Oxygen From Water,
W80-03550 1B

Irrigation Machine,
W80-03584 3F

Liquid Treatment Apparatus,
W80-03585 5G

Oxidation Process,
W80-03591 5D

Floating-Type Anti-Oil, Anti-Impact and Anti-Wave Barrier,
W80-03593 5G

Irrigation System,
W80-03595 3F

Sludge Thickening Apparatus and Process,
W80-03596 5D

PATH OF POLLUTANTS
Environmental Path of Arsenic in Groundwater,
W80-03303 5B

Total Mercury Content in Some Marine Fish from the Indian Ocean,
W80-03343 5B

PEAK DISCHARGE
Determining Peak-Discharge Frequencies in an Urbanizing Watershed--A Case Study,
W80-03349 2A

Flood Hydrograph and Peak Flow Frequency Analysis,
W80-03350 2A

PEAT
Changes in Decomposition Rate, Microbial Population and Carbohydrate Content of an Acid Peat Bog After Liming and Reclamation,
W80-03534 2G

PEDRO DOME-CLEARY SUMMIT AREA (ALASKA)
Environmental Path of Arsenic in Groundwater,
W80-03303 5B

PENNSYLVANIA
Effects of Limestone Strip Mining on Benthic Macroinvertebrate Communities,
W80-03460 5C

Water Resources Data for Pennsylvania, Water Year 1978--Volume 1. Delaware River Basin.
W80-03496 7C

Water Resources Data for Pennsylvania, Water Year 1978--Volume 2. Susquehanna and Potomac River Basins.
W80-03497 7C

Water Resources Data for Pennsylvania, Water Year 1978--Volume 3. Ohio River and St. Lawrence River Basins.
W80-03498 7C

PERCOLATION
Organic Qualities of Groundwaters,
W80-03437 5A

Trickle Irrigation Timing and Its Effect on Plant and Soil Water Status,
W80-03545 3F

PERFORMANCE
The Effect of Salinity on Geothermal Well Performance,
W80-03430 8B

PESTICIDE RESIDUES
Triazine Residues in a Watershed in Southwestern Ontario (1973-75),
W80-03389 5B

PESTICIDE TOXICITY
The Killing of Rush Creek,
W80-03318 5C

PHOSPHORUS
Phosphorus Recycle and Chlorophyll in the Great Lakes,
W80-03388 5C

The Effect of Wastewater Phosphorus Removal on Shagawa Lake, Minnesota: Phosphorus Supplies, Lake Phosphorus and Chlorophyll A,
W80-03459 5C

An Automated Procedure for the Determination of Phosphorus,
W80-03463 5A

PHOSPHORUS COMPOUNDS
The Problem of Phosphorus in the Eutrophic Lake Maryut,
W80-03371 5B

PHOTOSYNTHESIS
Inhibition of Carbon Fixation as a Function of Zinc Uptake in Natural Phytoplankton Assemblages,
W80-03340 5A

PHREATOPHYTES
Phreatophyte Evapotranspiration and its Potential Reduction Without Eradication,
W80-03442 2D

PHYTOPLANKTON
Inhibition of Carbon Fixation as a Function of Zinc Uptake in Natural Phytoplankton Assemblages,
W80-03340 5A

Phytoplankton Production in a Turbid, Temperate Salt Marsh Estuary,
W80-03372 2L

PIEDMONT REGION
Better Utilization of Ground Water in the Piedmont and Mountain Region of the Southeast,
W80-03327 6D

PIERCE COUNTY (WA)
Water Resources of the Nisqually Lake Area, Pierce County, Washington,
W80-03494 2A

PINK SALMON
Saprolegnia: Control of Fungus on Incubating Eggs of Pink Salmon by Treatment with Seawater,
W80-03336 5A

PIPE FLOW
Head-Loss Measurements on Hydroelectric Conduits,
W80-03453 8B

PIPELINES
Proximity of Pipelines and Storage Facilities for Gas and Oil to Major Aquifers in Connecticut,
W80-03479 7C

PLANNING
Reservoir Storage Determination by Computer Simulation of Flood Control and Conservation Systems,
W80-03348 6A

Planning for Development of Groundwater and Surface Water Resources,
W80-03450 2E

Economics of Irrigation and the Institutional and Pricing Systems of Water in Israel,
W80-03554 6C

Ohio River Basin Study--Comprehensive Survey: Volume III-Appendix B, Projective Economic Study.
W80-03579 6A

Integrated Planning for Water Quality Management: The Federal Water Pollution Control Act Amendments of 1972 and Coastal Zone Management,
W80-03581 6E

POLLUTION ABATEMENT
Floating-Type Anti-Oil, Anti-Impact and Anti-Wave Barrier,
W80-03593 5G

POLYCHAETES
Zinc--A Major Inorganic Component of Nereid Polychaete Jaws,
W80-03341 5B

POPULATION
Ohio River Basin Study--Comprehensive Survey: Volume V-Appendix D, Water Supply and Water Pollution Control.
W80-03577 5G

POTHOLES
Waterfowl Pair Use of Natural and Man-Made Wetlands in South Dakota,
W80-03441 6G

POTOMAC RIVER BASINS (PA)
Water Resources Data for Pennsylvania, Water Year 1978--Volume 2. Susquehanna and Potomac River Basins.
W80-03497 7C

POWERPLANTS
Cold Shock: Effect of Rate of Thermal Decrease on Atlantic Menhaden,
W80-03344 5C

An Analysis of Water Resources Constraints on Power Plant Siting in the Mid-Atlantic States,
W80-03361 6D

Aerial Inputs of Cadmium, Copper, Lead, and Manganese into a Freshwater Pond in the Vicinity of a Coal-Fired Power Plant,
W80-03466 5A

Impacts of Coal-Fired Power Plants on Fish, Wildlife and Their Habitats,
W80-03518 4C

PRECIPITATION
Nutrient and Particulate Fluxes in a Salt Marsh Ecosystem: Tidal Exchanges and Inputs by Precipitation and Groundwater,
W80-03532 2I

PRECIPITATION (ATMOSPHERIC)
Texas Hiplex Interim Progress Report for April 1 - September 30, 1979.
W80-03319 2B

Determining Overwater Precipitation from Overland Data: The Methodological Controversy Analyzed,
W80-03392 2B

Record Torrential Rainstorms on the Island of Hawaii, January-February 1979,
W80-03475 2B

PRECIPITATION GAGES
Determining Overwater Precipitation from Overland Data: The Methodological Controversy Analyzed,
W80-03392 2B

PRESERVATION WATERSHED MANAGEMENT
Wild River Inventory,
W80-03317 6E

PRICING
Economics of Irrigation and the Institutional and Pricing Systems of Water in Israel,
W80-03554 6C

PRODUCTIVITY
Production and Structure in the Early Stages of Vegetation Development in the Lauwerszee-Polder,
W80-03524 2L

PROJECT BENEFITS
A Dynamic Regional Impact Analysis of Federal Expenditures of a Water and Related Land Resource Project -- The Boise Project of Idaho, Part IV: A Social Impact Analysis of Federal Expenditures on a Water Related Resource Project: Boise Project, Social Subproject,
W80-03312 6B

PROJECT PLANNING
Sizing Flood Control Reservoir Systems by Systems Analysis,
W80-03353 6A

PROJECTIONS
Ohio River Basin Study--Comprehensive Survey: Volume XIII-Appendix L, Navigation.
W80-03570 6B

PROTEINS
Investigations into the Effects of Volume of Water Flow, Quality of Feed and Type of Feeding on the Production of the Aischgrund Common Carp, Cyprinus Carpio, in Circular Concrete Ponds Under High Stocking Density Rates,
W80-03323 8I

Two Heavy Metal-Binding Proteins in the Midgut Gland of the Crab Carcinus Maenas,
W80-03339 5B

PUBLIC ACCESS
Public Use of Water Resources Development Projects Administered by the Chief of Engineers (Final Rule).
W80-03407 6E

PUBLIC HEALTH
Drainage and Larviciding for Control of a Malaria Focus in Haiti,
W80-03505 4C

PUMPED STORAGE
Operational Simulation of a Reservoir System with Pumped Storage,
W80-03351 6A

PUMPING
Theis Parameter Evaluation from Pumping Tests by Sensitivity Analysis,
W80-03357 2F

PUMPS
Selection and Design of Injector Pump Systems,
W80-03429 8C

Downhole Pumps for Water Sampling in Small-Diameter Wells,
W80-03483 8C

RADIOISOTOPES
A Comparison of the Axial Distributions of Salt and 137CS in the Severn Estuary During August 1974,
W80-03373 5B

The Determination of Estuarine Sedimentation Rates by 134CS/137CS and Other Artificial Radionuclide Profiles,
W80-03377 2J

Migration of Radionuclide Chains in Ground Water,
W80-03433 5B

RAIN GAGES
A Distant Reading Raingauge,
W80-03476 7B

RAINFALL
A Hydrological Analysis of East Australian Floods Using Nimbus-5 Electrically Scanning Radiometer Data,
W80-03474 7B

Record Torrential Rainstorms on the Island of Hawaii, January-February 1979,
W80-03475 2B

A Distant Reading Raingauge,
W80-03476 7B

Very Large Floods in the Brahmaputra River in August 1962, Part I: Synoptic Aspects,
W80-03598 2B

RAINFALL COUNTER
A Distant Reading Raingauge,
W80-03476 7B

RAINFALL DISPOSITION
Land-Use and Upland Water Resources in Britain--A Strategic Look,
W80-03363 2A

RAINFALL-RUNOFF RELATIONSHIPS
A Systems Model of Stream Flow and Water Quality in the Bedford-Ouse River--1. Stream Flow Modelling,
W80-03456 2E

Performance Evaluation of Water Harvesting Catchments,
W80-03552 3B

An Urban Runoff Model for Tulsa, Oklahoma,
W80-03582 6A

RECREATION
Public Use of Water Resources Development Projects Administered by the Chief of Engineers (Final Rule).
W80-03407 6E

RECREATION DEMAND
Adverse Effects of Recreation on Sand Dunes: A Problem for Coastal Zone Management,
W80-03417 6E

Ohio River Basin Study--Comprehensive Survey: Volume IX-Appendix H, Outdoor Recreation.
W80-03573 6B

RED RUN DRAIN (MD)
Determining Peak-Discharge Frequencies in an Urbanizing Watershed--A Case Study,
W80-03349 2A

REGIONAL ANALYSIS
An Approach to the Construction of the Regional Water Resource Model,
W80-03587 6A

REGIONAL DEVELOPMENT
Ohio River Basin Study--Comprehensive Survey: Volume XIV-Appendix M, Flood Control.
W80-03569 2E

Ohio River Basin Study--Comprehensive Survey: Volume XII-Appendix K, Development Program Formulation.
W80-03571 6B

An Approach to the Construction of the Regional Water Resource Model,
W80-03587 6A

REGULATION
The Growing Need for Federal-State Cooperation in Managing the Sea,
W80-03421 6E

REGULATIONS
Safeguards for Groundwater,
W80-03422 6E

REMOTE SENSING
Hydrologic Land Use Classification Using Landsat,
W80-03347 7B

A Hydrological Analysis of East Australian Floods Using Nimbus-5 Electrically Scanning Radiometer Data,
W80-03474 7B

A Distant Reading Raingauge,
W80-03476 7B

Some Implications of Remote Sensing Technology in Insect Control Programs Including Mosquitoes,
W80-03514 7B

RESEARCH PRIORITIES
Identifying Research Priorities in Water Development,
W80-03594 6B

RESERVOIR OPERATION
Operational Simulation of a Reservoir System with Pumped Storage,
W80-03351 6A

RESERVOIR SILTING
Method Means for De-Silting Water,
W80-03410 5G

RESERVOIRS
Sizing Flood Control Reservoir Systems by Systems Analysis,
W80-03353 6A

Road De-Icing Salts in an Urban Stream and Flood Control Reservoir,
W80-03468 5B

RESINS
Resin Treatment Improves High-Color Ground Water,
W80-03436 5F

RESISTIVITY
Resistivity Investigations for Ground Water in Metamorphic Areas Near Dhanbad, India,
W80-03358 2F

RESOURCES DEVELOPMENT
United States Ocean Mineral Resource Interests and the United Nations Conference on the Law of the Sea,
W80-03415 6E

Developing Management Guidelines for Oil and Gas Activities: The Louisiana Experience,
W80-03418 6E

Ohio River Basin Study--Comprehensive Survey: Volume XIII-Appendix L, Navigation.
W80-03570 6B

RESPIRATION
Responses of the Fish Blennius Pholis to Fluctuating Salinities,
W80-03330 5A

RIVER BASIN DEVELOPMENT
Wild River Inventory,
W80-03317 6E

Ohio River Basin--Comprehensive Survey: Volume II-Appendix A, History of Study.
W80-03580 6D

RIVER SYSTEMS
Operational Simulation of a Reservoir System with Pumped Storage,
W80-03351 6A

The Effects of Drought on the River Systems,
W80-03448 2A

RIVERS
Wild River Inventory,
W80-03317 6E

Longitudinal Dispersion in Rivers,
W80-03378 5B

Pollution Problems Arising from the 1975-76 Drought,
W80-03449 2E

A Systems Model of Stream Flow and Water Quality in the Bedford-Ouse River--1. Stream Flow Modelling,
W80-03456 2E

Monitoring of Total Amount of Lipophilic Organo Chlorine Compounds in a Swedish River,
W80-03458 5B

One-Dimensional Transient Model for Short-Term Prediction of Downstream Pollution in Rivers,
W80-03461 5B

Very Large Floods in the Brahmaputra River in August 1962, Part I: Synoptic Aspects,
W80-03598 2B

ROOTED AQUATIC PLANTS
Environment, Vegetation and Phytogeography of the High-Altitude Bogs of Lesotho,
W80-03507 2I

Seasonality, Density and Diversity of Birds of a Papyrus Swamp in Western Kenya,
W80-03508 2I

Biogenic Structure and Its Effect on the Spatial Heterogeneity of Meiofauna in a Salt Marsh,
W80-03519 2I

The Contribution of Macrophytes to the Metalimnetic Oxygen Maximum in a Montane, Oligotrophic Lake,
W80-03533 2I

ROTARY DRILLING
Hydrologic Data from a Deep Test Well, City of Sarasota, Florida,
W80-03482 5D

RUNOFF
The Relationship Between the Time Bases of Simulation Models and Their Structure,
W80-03359 2E

Quality of Runoff from Land Receiving Surface Application and Injection of Liquid Dairy Manure,
W80-03443 5B

Ohio River Basin Study--Comprehensive Survey: Volume IV-Appendix C, Hydrology.
W80-03578 2E

RUNOFF FORECASTING
Maximum Utilization of Water Resources in a Planned Community -- Application of the Storm Water Management Model, Volume I,
W80-03565 4A

RURAL AREAS
Designing for Development: What is Appropriate Technology for Rural Water and Sanitation.
W80-03592 6B

RURAL WATER SUPPLY
Designing for Development: What is Appropriate Technology for Rural Water and Sanitation.
W80-03592 6B

Identifying Research Priorities in Water Development,
W80-03594 6B

SADDLE RIVER (NJ)
Distribution of Metals in Street Sweepings, Stormwater Solids, and Urban Aquatic Sediments,
W80-03543 5B

SAFETY FACTORS
Dam Safety: The Critical Imperative,
W80-03499 6E

SAHARA
Biogeographical Considerations of Colonization of the Lower Tilemsi Valley in the Second Millenium B.C.,
W80-03553 2A

SALINE LAKES
Vegetation Zonation Around Freshwater Springs of the Maharlu Salt Lake Near Shiraz (Iran), Vegetationszonierung an Susswasserquellen des Maharlusalzsees Bei Shiraz (Iran),
W80-03537 2I

SALINE WATER
Current Subsurface Intrusion of Mediterranean Seawater--A Possible Source of Groundwater Salinity in the Rift Valley System, Israel,
W80-03472 2A

The Paleohydrology of Southern Israel and Its Influence on the Flushing of the Kurnub and 'Arad Groups (Lower Cretaceous and Jurassic),
W80-03473 2A

SALINE WATER-FRESHWATER INTERFACES
Current Subsurface Intrusion of Mediterranean Seawater--A Possible Source of Groundwater Salinity in the Rift Valley System, Israel,
W80-03472 2A

SALINITY
Laboratory Observations on the Influence of Temperature and Salinity on Development of the Eggs and Growth of the Larvae of Solea Solea (Pisces),
W80-03329 5A

Responses of the Fish Blennius Pholis to Fluctuating Salinities,
W80-03330 5A

A Comparative Study of the Closure Responses of Some Cirripede Species Exposed to Falling Seawater Concentrations,
W80-03342 5A

On Man-Induced Variations in the Circulation of the Mediterranean Sea,
W80-03354 2L

A Comparison of the Axial Distributions of Salt and 137CS in the Severn Estuary During August 1974,
W80-03373 5B

The Effect of Salinity on Geothermal Well Performance,
W80-03430 8B

SALT MARSHES
Phytoplankton Production in a Turbid, Temperate Salt Marsh Estuary,
W80-03372 2L

Salt Marshes and Salt Deserts of the World,
W80-03504 2L

Drainage and Larviciding for Control of a Malaria Focus in Haiti,
W80-03505 4C

Spartina Alterniflora Seed Fungi,
W80-03509 2I

The Effects of Waterfowl Management Practices on Mosquito Abundance and Distribution in Louisiana Coastal Marshes,
W80-03511 6G

Biogenic Structure and Its Effect on the Spatial Heterogeneity of Meiofauna in a Salt Marsh,
W80-03519 2I

Nutrient and Particulate Fluxes in a Salt Marsh Ecosystem: Tidal Exchanges and Inputs by Precipitation and Groundwater,
W80-03532 2I

Vegetation Zonation Around Freshwater Springs of the Maharlu Salt Lake Near Shiraz (Iran), Vegetationszonierung an Susswasserquellen des Maharlusalzsees Bei Shiraz (Iran),
W80-03537 2I

Habitat Development Field Investigations, Salt Pond No. 3 Marsh Development Site, South San Francisco Bay, California; Summary Report,
W80-03555 4A

SALT TOLERANCE
Vegetation Zonation Around Freshwater Springs of the Maharlu Salt Lake Near Shiraz (Iran), Vegetationszonierung an Susswasserquellen des Maharlusalzsees Bei Shiraz (Iran),
W80-03537 2I

SALTMARSHES
The Effect of the Marsh Elder (Iva Frutescens) on the Standing Crop Biomass of Spartina Patens and Associated Wildlife,
W80-03516 2I

The Immediate Effects of Ditching a Saltmarsh on Nesting Herring Gulls Larus Argentatus,
W80-03520 4A

SALTS
Road De-Icing Salts in an Urban Stream and Flood Control Reservoir,
W80-03468 5B

SAMPLING
Downhole Pumps for Water Sampling in Small-Diameter Wells,
W80-03483 8C

SAN ANTONIO DAM
Side-Channel Spillway and Outlet Works for San Antonio Dam; Hydraulic Model Investigation,
W80-03394 8B

SAN FRANCISCO BAY (CALIF.)
Habitat Development Field Investigations, Salt Pond No. 3 Marsh Development Site, South San Francisco Bay, California; Summary Report,
W80-03555 4A

SANITARY ENGINEERING
Investigation of Sanitary Landfill Behavior, Volume I. Final Report,
W80-03567 5B

SAPROLEGNIA
Saprolegnia: Control of Fungus on Incubating Eggs of Pink Salmon by Treatment with Seawater,
W80-03336 5A

SARASOTA (FLA)
Hydrologic Data from a Deep Test Well, City of Sarasota, Florida,
W80-03482 5D

SATELLITES (ARTIFICIAL)
Hydrologic Land Use Classification Using Landsat,
W80-03347 7B

SAUDI ARABIA
Socio-Economic Changes and Development of Water Resources in Saudi Arabia,
W80-03502 6D

Dams Around the Holy City of Medina, and the Pressure on Its Water Supply,
W80-03549 6B

SAVANNAH RIVER (GA)
Operational Simulation of a Reservoir System with Pumped Storage,
W80-03351 6A

SCOTLAND
Factors Influencing Water Movements in the Firth of Clyde,
W80-03369 2L

SEA WATER
Saprolegnia: Control of Fungus on Incubating Eggs of Pink Salmon by Treatment with Seawater,
W80-03336 5A

Coastal Colloidal Carbon: A Study of its Seasonal Variation and the Possibility of River Input,
W80-03375 2L

SEDIMENT CONTROL
Effect of Sediment Control Dams on the Water Quality of a Prairie Lake,
W80-03477 4D

Laboratory Evaluation of Methods to Separate Fine Grained Sediment from Stormwater,
W80-03566 4D

SEDIMENT CONTROL DAMS
Effect of Sediment Control Dams on the Water Quality of a Prairie Lake,
W80-03477 4D

SEDIMENT TRANSPORT
A Predictive Model of Sediment Transport in Lake Michigan Based Upon Clay Mineralogy,
W80-03382 2J

SEDIMENT-WATER INTERFACES
Tracer Study of Sediment-Water Interactions in Estuaries,
W80-03368 2J

SEDIMENTATION RATES
The Determination of Estuarine Sedimentation Rates by 134CS/137CS and Other Artificial Radionuclide Profiles,
W80-03377 2J

SEDIMENTS
Tracer Study of Sediment-Water Interactions in Estuaries,
W80-03368 2J

Minor Elements in the Sediments of the Thames Estuary,
W80-03370 2J

Seasonal Shifts of Sediment Within an Estuary Mediated by Algal Growth,
W80-03374 2J

The Survival of Coliform Bacteria in Saline Sediments,
W80-03386 5B

Effects of Off-Road Vehicles on the Sediments of Hatches Harbor, Cape Cod National Seashore,
W80-03535 4C

SEEDS
Spartina Alterniflora Seed Fungi,
W80-03509 2I

SEPARATION TECHNIQUES
Process for the Separation of Foam from Effluents of Coke Oven Plants,
W80-03331 3E

Laboratory Evaluation of Methods to Separate Fine Grained Sediment from Stormwater,
W80-03566 4D

EPTIC TANK SLUDGE
A Study of the Characteristics and Pollution Potential of Land Spread Domestic Septage on Groundwater Quality,
W80-03306 5B

EVERN ESTUARY (UK)
A Comparison of the Axial Distributions of Salt and 137CS in the Severn Estuary During August 1974,
W80-03373 5B

EWAGE BACTERIA
The Survival of Coliform Bacteria in Saline Sediments,
W80-03386 5B

EWAGE DISPOSAL
The Problem of Phosphorus in the Eutrophic Lake Maryut,
W80-03371 5B

EWAGE TREATMENT
A Study of the Applicability of Batch Reactor Washwater Treatment for Areas of Intermittent Loading,
W80-03383 5D

Terminal Island Sewage Treatment Plant Outfall, Los Angeles Harbor, California; Hydraulic Model Investigation,
W80-03560 5E

Sludge Thickening Apparatus and Process,
W80-03596 5D

HAGAWA LAKE (MN)
The Effect of Wastewater Phosphorus Removal on Shagawa Lake, Minnesota: Phosphorus Supplies, Lake Phosphorus and Chlorophyll A,
W80-03459 5C

HALLOW WELLS
Well Drilling for +250F Water,
W80-03428 8A

HIP CREEK (ALASKA)
Geology and Geochemistry of the Ship Creek and Monashka Creek Reservoirs, Southcentral Alaska,
W80-03304 2K

HORES
Species Versatility in Shore Habitats,
W80-03521 2I

HRIMP
Enzyme Activities Following Chronic Exposure to Crude Oil in a Simulated Ecosystem. I: American Oysters and Brown Shrimp,
W80-03541 5C

IDE-CHANNEL SPILLWAYS
Side-Channel Spillway and Outlet Works for San Antonio Dam; Hydraulic Model Investigation,
W80-03394 8B

ILICA
Alumina-Lime-Soda Pilot Plant Testing at the U.S. Bureau of Reclamation Desalting Test Station at Yuma, Arizona,
W80-03307 5F

ILISTRA REGION (BULGARIA)
An Approach to the Construction of the Regional Water Resource Model,
W80-03587 6A

IMULATION ANALYSIS
The Relationship Between the Time Bases of Simulation Models and Their Structure,
W80-03359 2E

LOPE STABILIZATION
Combined Vegetative-Structural Slope Stabilization,
W80-03455 4D

LUDGE TREATMENT
Sludge Thickening Apparatus and Process,
W80-03596 5D

MALL-DIAMETER WELLS
Downhole Pumps for Water Sampling in Small-Diameter Wells,
W80-03483 8C

MALL WATERSHEDS
The Application of Hydrologic Models to Small Watersheds Having Mild Topography,
W80-03469 2B

OCIAL IMPACT
A Dynamic Regional Impact Analysis of Federal Expenditures of a Water and Related Land Resource Project -- The Boise Project of Idaho, Part IV: A Social Impact Analysis of Federal Expenditures on a Water Related Resource Project: Boise Project, Social Subproject,
W80-03312 6B

OIL ANALYSIS
Laboratory Procedures for Determining the Dispersibility of Clayey Soils,
W80-03316 8D

OIL CONTAMINATION
Humic and Fulvic Acids as Indicators of Soil and Water Pollution,
W80-03465 5A

OIL MICROORGANISMS
Changes in Decomposition Rate, Microbial Population and Carbohydrate Content of an Acid Peat Bog After Liming and Reclamation,
W80-03534 2G

OIL TESTS
Laboratory Procedures for Determining the Dispersibility of Clayey Soils,
W80-03316 8D

OIL TREATMENT
A Study of the Characteristics and Pollution Potential of Land Spread Domestic Septage on Groundwater Quality,
W80-03306 5B

OIL WATER
An Analysis of Infiltration in Initial Gradient Soils,
W80-03600 2G

OLAR RADIATION
Process for Catalytic Photo-Oxidation of Water,
W80-03440 1A

OLE
Laboratory Observations on the Influence of Temperature and Salinity on Development of the Eggs and Growth of the Larvae of Solea Solea (Pisces),
W80-03329 5A

OLEA
Laboratory Observations on the Influence of Temperature and Salinity on Development of the Eggs and Growth of the Larvae of Solea Solea (Pisces),
W80-03329 5A

OLUTES
Movement of Suspended Particles and Solute Concentrations with Inflow and Tidal Action,
W80-03564 2L

OUTH AFRICA
Gas Concentrations and Ages of Groundwaters in Beaufort Group Sediments, South Africa,
W80-03322 2F

OUTH CAROLINA
A Technology Transfer Study of Water Resources: A South Carolina Experience,
W80-03384 10D

Aerial Inputs of Cadmium, Copper, Lead, and Manganese into a Freshwater Pond in the Vicinity of a Coal-Fired Power Plant,
W80-03466 5A

Tidelands and the Public Trust: An Application for South Carolina,
W80-03526 6E

OUTH DAKOTA
South Dakota Ground Water and the Artesian Pressure: Is the Use of Water for Domestic Purposes Still the Highest Use.,
W80-03420 6E

Waterfowl Pair Use of Natural and Man-Made Wetlands in South Dakota,
W80-03441 6G

OUTH FLORIDA
Characteristics of Four Urbanized Basins in South Florida,
W80-03486 7C

OUTHEAST U.S.
Better Utilization of Ground Water in the Piedmont and Mountain Region of the Southeast,
W80-03327 6D

OUTHWEST U.S.
The Economic Feasibility of Dual Purpose Nuclear Desalination of Ground Water,
W80-03544 3A

PATIAL DATA MANAGEMENT
The Development and Servicing of Spatial Data Management Techniques in the Corps of Engineers,
W80-03588 6A

Flood Damage Assessments Using Spatial Data Management Techniques,
W80-03589 6A

PATIAL DISTRIBUTION
Biogenic Structure and Its Effect on the Spatial Heterogeneity of Meiofauna in a Salt Marsh,
W80-03519 2I

PECIFIC CONDUCTIVITY
An Automatic Range-Switching Modification for Direct-Reading Specific Conductance Measurements,
W80-03328 7B

PECTRUM ANALYSIS
Movement of Suspended Particles and Solute Concentrations with Inflow and Tidal Action,
W80-03564 2L

PILLWAYS
Side-Channel Spillway and Outlet Works for San Antonio Dam; Hydraulic Model Investigation,
W80-03394 8B

PORT FISHING
Ohio River Basin Study--Comprehensive Survey: Volume VIII-Appendix G, Fish and Wildlife Resources.
W80-03574 6B

PRINKLING
Performance Evaluation of Water Harvesting Catchments,
W80-03552 3B

T. ANTHONY FALLS LOCK & DAM (MISSISSIPPI RIVER)
Vortex Problem at Intake, Lower St. Anthony Falls Lock and Dam, Mississippi River, Minneapolis, Minnesota; Hydraulic Model Investigation,
W80-03557 8A

ST. LAWRENCE RIVER
A Hydraulic Transient Model of the Upper St. Lawrence River for Water Resources Studies, W80-03366 2E

ST. LAWRENCE RIVER BASIN (PA)
Water Resources Data for Pennsylvania, Water Year 1978--Volume 3. Ohio River and St. Lawrence River Basins. W80-03498 7C

STABILITY
South Jetty Stability Study, Masonboro Inlet, North Carolina: Hydraulic Model Investigation, W80-03397 8B

Stability and Stress Analyses of Brandon Road Dam, Illinois Waterway, W80-03558 8A

STANDARD PROJECT FLOOD
Ohio River Basin Study--Comprehensive Survey: Volume IV-Appendix C, Hydrology. W80-03578 2E

STATE GOVERNMENTS
The Growing Need for Federal-State Cooperation in Managing the Sea, W80-03421 6E

STORAGE TANKS
Proximity of Pipelines and Storage Facilities for Gas and Oil to Major Aquifers in Connecticut, W80-03479 7C

STORM RUNOFF
Summary Report, Southeast Conference on Urban Stormwater Management, W80-03381 4A

Laboratory Evaluation of Methods to Separate Fine Grained Sediment from Stormwater, W80-03566 4D

STORM RUNOFF MODELING
Problems in Weighting of Hyetographs, W80-03365 2B

STORM WATER
Summary Report, Southeast Conference on Urban Stormwater Management, W80-03381 4A

STORMS
Problems in Weighting of Hyetographs, W80-03365 2B

STORMWATER
Distribution of Metals in Street Sweepings, Stormwater Solids, and Urban Aquatic Sediments, W80-03543 5B

STRAIN GAGES
Shaft Torsional Oscillations of Hydrogenerators, W80-03315 8C

STRAITS OF GIBRALTAR
On Man-Induced Variations in the Circulation of the Mediterranean Sea, W80-03354 2L

STREAM OVERLOADING
Aggradation in Streams Due to Overloading, W80-03452 2J

STREAMFLOW
A Systems Model of Stream Flow and Water Quality in the Bedford-Ouse River--1. Stream Flow Modelling, W80-03456 2E

Assessment of Effects of Altered Stream Flow Characteristics on Fish and Wildlife. Part B: California, Case Studies, W80-03517 6G

Ohio River Basin Study--Comprehensive Survey: Volume IV-Appendix C, Hydrology. W80-03578 2E

An Urban Runoff Model for Tulsa, Oklahoma, W80-03582 6A

STREAMFLOW FORECASTING
Hydrometeorological Model for Streamflow Prediction, W80-03487 2A

An Urban Runoff Model for Tulsa, Oklahoma, W80-03582 6A

STREAMS FISHERIES
Water Resources of the Nisqually Lake Area, Pierce County, Washington, W80-03494 2A

STRESS ANALYSIS
Stability and Stress Analyses of Brandon Road Dam, Illinois Waterway, W80-03558 8A

STRIP MINES
Effects of Limestone Strip Mining on Benthic Macroinvertebrate Communities, W80-03460 5C

SUBSURFACE MAPPING
Delineation of Buried River Valley Aquifers in Dissected Till Plains, W80-03302 7C

SUCCESSION
Production and Structure in the Early Stages of Vegetation Development in the Lauwerszee-Polder, W80-03524 2L

SUNFISHES
Accumulation, Elimination, and Metabolism of Dichlorobenzidine in the Bluegill Sunfish, W80-03334 5B

SURFACE-GROUNDWATER RELATIONSHIPS
Water Resources of the Nisqually Lake Area, Pierce County, Washington, W80-03494 2A

SURFACE WATER
Water Resources Data for Maine, Water Year 1978. W80-03492 7C

SURFACE WATERS
Water Resources Data for New Hampshire and Vermont, Water Year 1978. W80-03491 7C

Water Resources Data for Georgia, Water Year 1978. W80-03493 7C

Water-Resources Investigations of the U.S. Geological Survey in Wyoming, Fiscal Year 1979, W80-03495 7C

Water Resources Data for Pennsylvania, Water Year 1978--Volume 1. Delaware River Basin. W80-03496 7C

Water Resources Data for Pennsylvania, Water Year 1978--Volume 2. Susquehanna and Potomac River Basins. W80-03497 7C

Water Resources Data for Pennsylvania, Water Year 1978--Volume 3. Ohio River and St. Lawrence River Basins. W80-03498 7C

SURVEYS
Archeological Investigations Along the Salt-Gila Aqueduct, W80-03321 6B

Resistivity Investigations for Ground Water in Metamorphic Areas Near Dhanbad, India, W80-03358 2F

SUSPENDED LOAD
Movement of Suspended Particles and Solute Concentrations with Inflow and Tidal Action, W80-03564 2L

SUSPENDED SOLIDS
Minor Elements in the Sediments of the Thames Estuary, W80-03370 2J

SUSQUEHANNA RIVER BASINS (PA)
Water Resources Data for Pennsylvania, Water Year 1978--Volume 2. Susquehanna and Potomac River Basins. W80-03497 7C

SWAMPS
Tree Rings as Indicators of Hydrologic Change in the Great Dismal Swamp, Virginia and North Carolina, W80-03490 7B

Seasonality, Density and Diversity of Birds of a Papyrus Swamp in Western Kenya, W80-03508 2I

SWEDEN
Monitoring of Total Amount of Lipophilic Organo Chlorine Compounds in a Swedish River, W80-03458 5B

SYSTEMS ANALYSIS
Operational Simulation of a Reservoir System with Pumped Storage, W80-03351 6A

Sizing Flood Control Reservoir Systems by Systems Analysis, W80-03353 6A

TECHNOLOGY
A Technology Transfer Study of Water Resources: A South Carolina Experience, W80-03384 10D

TERMINAL ISLAND (CALIF)
Terminal Island Sewage Treatment Plant Outfall, Los Angeles Harbor, California; Hydraulic Model Investigation, W80-03560 5E

TEXAS
Texas Hiplex Interim Progress Report for April 1 - September 30, 1979. W80-03319 2B

Texas Hiplex 1979 Field Operations Summary, W80-03320 2B

Analytical Study of the Ogallala Aquifer in Carson County, Texas, Projections of Saturated Thickness, Volume of water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields, W80-03451 7C

Maximum Utilization of Water Resources in a Planned Community -- Application of the Storm Water Management Model, Volume I, W80-03565 4A

THAMES ESTUARY (ENGLAND)
Minor Elements in the Sediments of the Thames Estuary, W80-03370 2J

THAMES RIVER (ENGLAND)
Perspectives from Three Years Experience of Regional Water Services in Thames Water Authority, W80-03364 5G

THEORETICAL ANALYSIS
Overflow Tests Analysed by Theoretical and Numerical Methods,
W80-03356 2F

THERMAL STRESS
Cold Shock: Effect of Rate of Thermal Decrease on Atlantic Menhaden,
W80-03344 5C

TIDAL INLETS
Numerical Simulation of the Coos Bay-South Slough Complex,
W80-03559 2L

TIDAL MARSHES
Tidelands and the Public Trust: An Application for South Carolina,
W80-03526 6E

TIMING
Trickle Irrigation Timing and Its Effect on Plant and Soil Water Status,
W80-03545 3F

TISSUE ANALYSIS
Responses of the Fish Blennius Pholis to Fluctuating Salinities,
W80-03330 5A

Accumulation, Elimination, and Metabolism of Dichlorobenzidine in the Bluegill Sunfish,
W80-03334 5B

Two Heavy Metal-Binding Proteins in the Midgut Gland of the Crab Carcinus Maenas,
W80-03339 5B

Inhibition of Carbon Fixation as a Function of Zinc Uptake in Natural Phytoplankton Assemblages,
W80-03340 5A

Zinc--A Major Inorganic Component of Nereid Polychaete Jaws,
W80-03341 5B

Total Mercury Content in Some Marine Fish from the Indian Ocean,
W80-03343 5B

Longevity and Reproduction of Daphnia Pulex (De Geer) Exposed to Cadmium-Contaminated Food or Water,
W80-03439 5A

TOWBOATS
Feasibility Study of a Numerical Tow Model,
W80-03562 8B

TOXICITY
Responses of the Fish Blennius Pholis to Fluctuating Salinities,
W80-03330 5A

Evaluation of Cutrine for Use in Fish Culture,
W80-03335 5A

Fundamental Studies on the Influence of Oil Pollution Upon Marine Organisms--IV the Toxicity of Mixtures of Oil Products and Oil-Spill Emulsifiers to Phytoplankton (In Japanese),
W80-03338 5C

Longevity and Reproduction of Daphnia Pulex (De Geer) Exposed to Cadmium-Contaminated Food or Water,
W80-03439 5A

TRACE ELEMENTS
Trace Element release from Estuarine Sediments of South Mosquito Lagoon Near Kennedy Space Center,
W80-03355 5A

Minor Elements in the Sediments of the Thames Estuary,
W80-03370 2J

TRACERS
Tracer Study of Sediment-Water Interactions in Estuaries,
W80-03368 2J

One-Dimensional Transient Model for Short-Term Prediction of Downstream Pollution in Rivers,
W80-03461 5B

TRANSMISSIVITY
Identification of Aquifer Parameters Using Numerical Techniques,
W80-03305 2F

TREATMENT FACILITIES
Terminal Island Sewage Treatment Plant Outfall, Los Angeles Harbor, California; Hydraulic Model Investigation,
W80-03560 5E

TREES
The Effect of the Marsh Elder (Iva Frutescens) on the Standing Crop Biomass of Spartina Patens and Associated Wildlife,
W80-03516 2I

TRIAZINE PESTICIDES
Triazine Residues in a Watershed in Southwestern Ontario (1973-75),
W80-03389 5B

TRICKLE IRRIGATION
Trickle Irrigation Timing and Its Effect on Plant and Soil Water Status,
W80-03545 3F

TRIHALOMETHANES
Production of Haloform Precursors by Water Pipe Bacterial Films.
W80-03478 5A

TSUNAMIS
Type 16 Flood Insurance Study: Tsunami Predictions for the West Coast of the Continental United States,
W80-03556 2E

TUMBLEWEED
Arid Lands Biomass Production in Arizona,
W80-03546 2I

TUNA
Total Mercury Content in Some Marine Fish from the Indian Ocean,
W80-03343 5B

TUNNEL LININGS
Head-Loss Measurements on Hydroelectric Conduits,
W80-03453 8B

TURBULENT BOUNDARY LAYERS
Flow Past Fence in Turbulent Boundary Layer,
W80-03454 8B

UNITED KINGDOM
A Comparison of the Axial Distributions of Salt and 137CS in the Severn Estuary During August 1974,
W80-03373 5B

UNITED NATIONS
The Third United Nations Conference on the Law of the Sea: The Seventh Session (1978),
W80-03500 6E

URBAN HYDROLOGY
Determining Peak-Discharge Frequencies in an Urbanizing Watershed--A Case Study,
W80-03349 2A

Characteristics of Four Urbanized Basins in South Florida,
W80-03486 7C

URBAN RUNOFF
Testing of Several Runoff Models on an Urban Watershed,
W80-03352 2A

Use of Synographic Techniques in Research and Dissemination of Hydrological Information,
W80-03360 7C

Summary Report, Southeast Conference on Urban Stormwater Management,
W80-03381 4A

Characteristics of Four Urbanized Basins in South Florida,
W80-03486 7C

Distribution of Metals in Street Sweepings, Stormwater Solids, and Urban Aquatic Sediments,
W80-03543 5B

Maximum Utilization of Water Resources in a Planned Community -- Application of the Storm Water Management Model, Volume I,
W80-03565 4A

URBANIZATION
Determining Peak-Discharge Frequencies in an Urbanizing Watershed--A Case Study,
W80-03349 2A

Dams Around the Holy City of Medina, and the Pressure on Its Water Supply,
W80-03549 6B

VARIABILITY
Tree Rings as Indicators of Hydrologic Change in the Great Dismal Swamp, Virginia and North Carolina,
W80-03490 7B

VEGETATION
Some Implications of Remote Sensing Technology in Insect Control Programs Including Mosquitoes,
W80-03514 7B

Vegetation and Nutrient Status of Northern Michigan Fens,
W80-03523 2I

Vegetation Study Undertaken at the Lamto Sau Savanna Reserve (Ivory Coast)--(Vegetationskundliche Untersuchungen Im Savannenreservat Lamto (Elfenbeinkuste)),
W80-03527 2I

VEGETATION EFFECTS
Ecology of Water-Level Manipulations on a Northern Marsh,
W80-03515 2I

VEGETATION ESTABLISHMENT
Habitat Development Field Investigations, Buttermilk Sound Marsh Development Site, Atlantic Intracoastal Waterway, Georgia: Appendix A: Propagation of Marsh Plants and Post-Propagation Monitoring,
W80-03399 5E

Combined Vegetative-Structural Slope Stabilization,
W80-03455 4D

Production and Structure in the Early Stages of Vegetation Development in the Lauwerszee-Polder,
W80-03524 2L

VEGETATION REGROWTH
Effects of Off-Road Vehicles on Plants of a Northern Marsh,
W80-03536 4C

VENTILATION RATES
Responses of the Fish Blennius Pholis to Fluctuating Salinities,
W80-03330 5A

VERMONT
Groundwater Rights in Vermont: Drinkwine V. State,
W80-03403 6E

Water Resources Data for New Hampshire and Vermont, Water Year 1978.
W80-03491 7C

VIRGINIA
Flood Hazard Study, Little Calfpasture River -- Grassy Run, Augusta County, Virginia.
W80-03314 2E

VORTICES
Vortex Problem at Intake, Lower St. Anthony Falls Lock and Dam, Mississippi River, Minneapolis, Minnesota; Hydraulic Model Investigation,
W80-03557 8A

WALES
Scientific Aspects of the 1975-76 Drought in England and Wales,
W80-03444 2E

Meteorological Aspects of the 1975-76 Drought,
W80-03445 2E

Some Detailed Water Balance Studies of Research Catchments,
W80-03446 2A

The Effect of the Drought on British Agriculture,
W80-03447 2E

The Effects of Drought on the River Systems,
W80-03448 2A

Pollution Problems Arising from the 1975-76 Drought,
W80-03449 2E

Planning for Development of Groundwater and Surface Water Resources,
W80-03450 2E

WASHINGTON
Hydrometeorological Model for Streamflow Prediction,
W80-03487 2A

WASSAW SOUND (GA)
Phytoplankton Production in a Turbid, Temperate Salt Marsh Estuary,
W80-03372 2L

WASTE DISPOSAL
Processes Affecting the Fate of Dredged Material,
W80-03396 5E

Confined Disposal Area Effluent and Leachate Control (Laboratory and Field Investigations),
W80-03398 5E

EPA's Hazardous-Waste Program: Will it Save our Ground Water,
W80-03431 5E

Hydrologic Data from a Deep Test Well, City of Sarasota, Florida,
W80-03482 5D

Investigation of Sanitary Landfill Behavior, Volume I. Final Report,
W80-03567 5B

Disposal of Dredged Material Within the New York District: Volume I-Present Practices and Candidate Alternatives,
W80-03586 5B

WASTE TREATMENT
Oxidation Process,
W80-03591 5D

WASTE WATER TREATMENT
Process for Soluble Cyanide Removal from Wastewater Streams,
W80-03362 5D

A Study of the Applicability of Batch Reactor Washwater Treatment for Areas of Intermittent Loading,
W80-03383 5D

Method and Apparatus for Recovering Liquid and Solid Constituents of Water Solutions Containing Sparingly Soluble Solids,
W80-03414 5D

Water Purification Method and Apparatus,
W80-03426 5D

Purification of Waste Streams Containing Available Chlorine,
W80-03539 5D

Oxidation Process,
W80-03591 5D

Sludge Thickening Apparatus and Process,
W80-03596 5D

WASTES
Evaluation of Dredged Material Pollution Potential,
W80-03395 5C

WATER ALLOCATION (POLICY)
Industrial Water Allocation and Conservation in California.
W80-03597 3E

WATER ANALYSIS
Water-Quality Data for Landfills, Hillsborough County, Florida, January 1974-October 1977,
W80-03489 5B

WATER AUTHORITIES
Perspectives from Three Years Experience of Regional Water Services in Thames Water Authority,
W80-03364 5G

WATER BALANCE
Some Detailed Water Balance Studies of Research Catchments,
W80-03446 2A

Trickle Irrigation Timing and Its Effect on Plant and Soil Water Status,
W80-03545 3F

WATER BIRDS
A Selected Bibliography of the Life Requirements of Colonial Nesting Waterbirds and Their Relationship to Dredged Material Islands,
W80-03393 5C

WATER CHEMISTRY
Geology and Geochemistry of the Ship Creek and Monashka Creek Reservoirs, Southcentral Alaska,
W80-03304 2K

An Automated Procedure for the Determination of Phosphorus,
W80-03463 5A

WATER CIRCULATION
On Man-Induced Variations in the Circulation of the Mediterranean Sea,
W80-03354 2L

WATER CONSERVATION
Industrial Water Allocation and Conservation in California.

Designing for Development: What is Appropriate Technology for Rural Water and Sanitation.
W80-03592 6B

Identifying Research Priorities in Water Development,
W80-03594 6B

WATER RESOURCES PLANNING
Ohio River Basin Study--Comprehensive Survey: Volume XII-Appendix K, Development Program Formulation.
W80-03571 6B

Ohio River Basin--Comprehensive Survey: Volume II-Appendix A, History of Study.
W80-03580 6D

WATER REUSE
Wastewater Helps the Barley Grow,
W80-03547 3C

WATER RIGHTS
Procedural Considerations in the Judicial Determination of Water Disputes,
W80-03411 6E

WATER SOURCES
Ohio River Basin Study--Comprehensive Survey: Volume VI-Appendix E, Groundwater.
W80-03576 2F

WATER SUPPLY
Better Utilization of Ground Water in the Piedmont and Mountain Region of the Southeast,
W80-03327 6D

The Management of Ground Water Supplies,
W80-03435 4B

Hydrologic Records, Verna Well-Field Area, City of Sarasota, Florida, 1962-76--A Data Report,
W80-03485 7C

Application of Operations Research Techniques for a Problem in Water Resources Management: Economic Appraisal of Changes in Water Use Induced by Investments into Navigable Rivers and Canals,
W80-03501 6A

Ohio River Basin Study--Comprehensive Survey: Volume VI-Appendix E, Groundwater.
W80-03576 2F

WATER SUPPLY DEVELOPMENT
Ohio River Basin Study--Comprehensive Survey: Volume XII-Appendix K, Development Program Formulation.
W80-03571 6B

Ohio River Basin--Comprehensive Survey: Volume II-Appendix A, History of Study.
W80-03580 6D

Designing for Development: What is Appropriate Technology for Rural Water and Sanitation.
W80-03592 6B

WATER TECHNOLOGY
Designing for Development: What is Appropriate Technology for Rural Water and Sanitation.
W80-03592 6B

WATER TEMPERATURE
Laboratory Observations on the Influence of Temperature and Salinity on Development of the Eggs and Growth of the Larvae of Solea Solea (Pisces),
W80-03329 5A

Thermal Predictions Using Integral Energy Model,
W80-03380 2H

WATER TREATMENT
Alumina-Lime-Soda Pilot Plant Testing at the U.S. Bureau of Reclamation Desalting Test Station at Yuma, Arizona,
W80-03307 5F

Water Purifier System and Valve,
W80-03310 5F

The Placing of the Disinfection Stage in a Reclamation Plant to Reduce Haloform Formation,
W80-03324 5F

The Significance of the Root Mean Square Velocity Gradient and its Calculation in Devices for Water Treatment,
W80-03326 5F

Apparatus and Method for Treatment of Fluid with Ozone,
W80-03332 5F

Anti-Corrosion Composition for Use in Aqueous Systems,
W80-03409 5G

Method Means for De-Silting Water,
W80-03410 5G

Resin Treatment Improves High-Color Ground Water,
W80-03436 5F

Liquid Treatment Apparatus,
W80-03585 5G

WATER TYPES
Ice Thickness Indicator,
W80-03513 2C

WATER UTILIZATION
Better Utilization of Ground Water in the Piedmont and Mountain Region of the Southeast,
W80-03327 6D

The Coffee Sand and Ripley Aquifers in Mississippi,
W80-03484 2F

Municipal Water Use,
W80-03551 6D

WATER WELLS
Overflow Tests Analysed by Theoretical and Numerical Methods,
W80-03356 2F

Downhole Pumps for Water Sampling in Small-Diameter Wells,
W80-03483 8C

Hydrologic Records, Verna Well-Field Area, City of Sarasota, Florida, 1962-76--A Data Report,
W80-03485 7C

WATER YIELD
Land-Use and Upland Water Resources in Britain--A Strategic Look,
W80-03363 2A

Some Detailed Water Balance Studies of Research Catchments,
W80-03446 2A

WATER YIELD IMPROVEMENT
Performance Evaluation of Water Harvesting Catchments,
W80-03552 3B

WATERFOWL
Waterfowl Pair Use of Natural and Man-Made Wetlands in South Dakota,
W80-03441 6G

The Effects of Waterfowl Management Practices on Mosquito Abundance and Distribution in Louisiana Coastal Marshes,
W80-03511 6G

WATERSHED MANAGEMENT
Perspectives from Three Years Experience of Regional Water Services in Thames Water Authority,
W80-03364 5G

WATERSHEDS (BASINS)
Flood Hydrograph and Peak Flow Frequency Analysis,

NEBRASKA UNIV., LINCOLN. DEPT. OF AGRICULTURAL ENGINEERING.
The Application of Hydrologic Models to Small Watersheds Having Mild Topography,
W80-03469 2B

NEDERLANDS INST. VOOR ONDERZOEK DER ZEE, TEXEL.
Laboratory Observations on the Influence of Temperature and Salinity on Development of the Eggs and Growth of the Larvae of Solea Solea (Pisces),
W80-03329 5A

NEW JERSEY AGRICULTURAL EXPERIMENT STATION, NEW BRUNSWICK.
The Effect of the Marsh Elder (Iva Frutescens) on the Standing Crop Biomass of Spartina Patens and Associated Wildlife,
W80-03516 2I

NEW MEXICO STATE UNIV., LAS CRUCES. DEPT. OF AGRICULTURAL ECONOMICS.
The Economic Feasibility of Dual Purpose Nuclear Desalination of Ground Water,
W80-03544 3A

NEW SOUTH WALES UNIV., KENSINGTON (AUSTRALIA). SCHOOL OF MICROBIOLOGY.
The Survival of Coliform Bacteria in Saline Sediments,
W80-03386 5B

NEW YORK STATE DEPT. OF ENVIRONMENTAL CONSERVATION, ROME.
Evaluation of Cutrine for Use in Fish Culture,
W80-03335 5A

Iodophor Disinfection of Muskellunge Eggs Under Intensive Culture in Hatcheries,
W80-03337 5A

NORTH CAROLINA STATE UNIV. AT RALEIGH.
Effects of Sublethal Oil Concentrations on the Copepod, Nitocra Affinis,
W80-03540 5C

NORTH CAROLINA UNIV. AT MOREHEAD CITY. INST. OF MARINE SCIENCES.
Spartina Alterniflora Seed Fungi,
W80-03509 2I

NORTH CAROLINA WATER RESOURCES INST., RALEIGH.
Summary Report, Southeast Conference on Urban Stormwater Management,
W80-03381 4A

OBSERVATORY, NEW DELHI (INDIA).
Very Large Floods in the Brahmaputra River in August 1962, Part I: Synoptic Aspects,
W80-03598 2B

OKLAHOMA STATE UNIV., STILLWATER. SCHOOL OF BIOLOGICAL SCIENCES.
Effects of Destratification on Sediment Chemistry and Benthic Macroinvertebrates in Ham's Lake,
W80-03308 2H

OLIN CORP. NEW HAVEN, CT. (ASSIGNEE).
Purification of Waste Streams Containing Available Chlorine,
W80-03539 5D

ONTARIO HYDRO, TORONTO.
Road De-Icing Salts in an Urban Stream and Flood Control Reservoir,
W80-03468 5B

ONTARIO MINISTRY OF AGRICULTURE AND FOOD, GUELPH. PESTICIDE RESIDUE LAB.
Triazine Residues in a Watershed in Southwestern Ontario (1973-75),
W80-03389 5B

ORANGE FREE STATE UNIV., BLOEMFONTEIN (SOUTH AFRICA). INST. OF ENVIRONMENTAL SCIENCE.
Environment, Vegetation and Phytogeography of the High-Altitude Bogs of Lesotho,
W80-03507 2I

OREGON INST. OF TECH., KLAMATH FALLS. GEO-HEAT UTILIZATION CENTER.
Well Drilling for +250F Water,
W80-03428 8A

PENNSYLVANIA STATE UNIV., UNIVERSITY PARK. DEPT. OF CIVIL ENGINEERING.
Problems in Weighting of Hyetographs,
W80-03365 2B

PUNJAB AGRICULTURAL UNIV., LUDHIANA (INDIA).
An Analysis of Infiltration in Initial Gradient Soils,
W80-03600 2G

PUNJAB AGRICULTURAL UNIV., LUDHIANA (INDIA). DEPT. OF CIVIL ENGINEERING.
Aggradation in Streams Due to Overloading,
W80-03452 2J

QUATIC CHEMICALS LTD., GUELPH (ONTARIO). (ASSIGNEE).
Anti-Corrosion Composition for Use in Aqueous Systems,
W80-03409 5G

QUEEN MARY COLL., LONDON (ENGLAND). DEPT. OF ZOOLOGY AND COMPARATIVE PHYSIOLOGY.
Two Heavy Metal-Binding Proteins in the Midgut Gland of the Crab Carcinus Maenas,
W80-03339 5B

RHODE ISLAND UNIV., KINGSTON. GRADUATE SCHOOL OF OCEANOGRAPHY.
Tracer Study of Sediment-Water Interactions in Estuaries,
W80-03368 2J

ROORKEE UNIV. (INDIA). DEPT. OF CIVIL ENGINEERING.
Flow Past Fence in Turbulent Boundary Layer,
W80-03454 8B

RUTGERS - THE STATE UNIV., NEW BRUNSWICK, NJ. DEPT. OF ENVIRONMENTAL SCIENCE.
Distribution of Metals in Street Sweepings, Stormwater Solids, and Urban Aquatic Sediments,
W80-03543 5B

SAN DIEGO STATE UNIV., CA. CENTER FOR MARINE STUDIES.
Community Structure and Seasonal Variation in Intertidal Panamanian Sandy Beaches,
W80-03376 2L

SAN FRANCISCO BAY MARINE RESEARCH CENTER, INC., RICHMOND, CA.
Habitat Development Field Investigations, Salt Pond No. 3 Marsh Development Site, South San Francisco Bay, California; Summary Report,
W80-03555 4A

SAVANNAH RIVER ECOLOGY LAB., AIKEN, SC.
Aerial Inputs of Cadmium, Copper, Lead, and Manganese into a Freshwater Pond in the Vicinity of a Coal-Fired Power Plant,
W80-03466 5A

SAVANNAH STATE COLL., GA.
Trace Element release from Estuarine Sediments of South Mosquito Lagoon Near Kennedy Space Center,
W80-03355 5A

SCIENCE AND EDUCATION ADMINISTRATION, TUCSON, AZ. SOUTHWEST RANGELAND WATERSHED RESEARCH CENTER.
Performance Evaluation of Water Harvesting Catchments,
W80-03552 3B

SEPARA (PTY) LTD, JOHANNESBURG, (SOUTH AFRICA).
The Significance of the Root Mean Square Velocity Gradient and its Calculation in Devices for Water Treatment,
W80-03326 5F

SHIMO-LA-TEWA SCHOOL, MOMBASA (KENYA).
Seasonality, Density and Diversity of Birds of a Papyrus Swamp in Western Kenya,
W80-03508 2I

SOIL AND IRRIGATION RESEARCH INST., PRETORIA (SOUTH AFRICA).
An Improved Weighing Lysimeter Facility for Citrus Evapotranspiration Studies,
W80-03325 2D

SOIL CONSERVATION SERVICE, WASHINGTON, DC.
Flood Hazard Study, Little Calfpasture River -- Grassy Run, Augusta County, Virginia.
W80-03314 2E

SOUTH CAROLINA UNIV., COLUMBIA. BELLE W. BARUCH INST. FOR MARINE BIOLOGY AND COASTAL RESEARCH.
Biogenic Structure and Its Effect on the Spatial Heterogeneity of Meiofauna in a Salt Marsh,
W80-03519 2I

SOUTH DAKOTA STATE UNIV., BROOKINGS. DEPT OF WILDLIFE AND FISHERIES.
Waterfowl Pair Use of Natural and Man-Made Wetlands in South Dakota,
W80-03441 6G

SOUTH DAKOTA STATE UNIV. DEPT. OF BIOLOGY.
Effect of Sediment Control Dams on the Water Quality of a Prairie Lake,
W80-03477 4D

SOUTHERN FOREST EXPERIMENT STATION, PINEVILLE, IA. FOREST INSECT RESEARCH.
Dealing with Site Disturbances from Harvesting and Site Preparation in the Lower Coastal Plain,
W80-03503 4C

STERLING DRUG INC., NEW YORK. (ASSIGNEE).
Oxidation Process,
W80-03591 5D

SYRACUSE RESEARCH CORP., NY. LIFE SCIENCES DIV.
Accumulation, Elimination, and Metabolism of Dichlorobenzidine in the Bluegill Sunfish,
W80-03334 5B

TECHNION-ISRAEL INST. OF TECH., HAIFA. FACULTY OF CIVIL ENGINEERING.
The Relationship Between the Time Bases of Simulation Models and Their Structure,
W80-03359 2E

TEXAS DEPT. OF WATER RESOURCES, AUSTIN.
Texas Hiplex 1979 Field Operations Summary,
W80-03320 2B

Analytical Study of the Ogallala Aquifer in Carson County, Texas, Projections of Saturated Thickness, Volume of water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W80-03451 7C

TEXAS DEPT. OF WATER RESOURCES, AUSTIN. PLANNING AND DEVELOPMENT DIV.
Texas Hiplex Interim Progress Report for April 1 - September 30, 1979.
W80-03319 2B

TEXAS UNIV. AT AUSTIN. CENTER FOR RESEARCH IN WATER RESOURCES.
An Urban Runoff Model for Tulsa, Oklahoma,
W80-03582 6A

TEXAS UNIV. AT AUSTIN, PORT ARANSAS. MARINE SCIENCE INST.
Responses of Freshwater Benthos to Open-Lake Dredged Spoils Disposal in Lake Erie,
W80-03391 5C

TEXAS UNIV. AT HOUSTON. SCHOOL OF PUBLIC HEALTH.
Use of Synographic Techniques in Research and Dissemination of Hydrological Information,
W80-03360 7C

THAMES WATER AUTHORITY, LONDON (ENGLAND).
Perspectives from Three Years Experience of Regional Water Services in Thames Water Authority,
W80-03364 5G

THAMES WATER AUTHORITY, LONDON (ENGLAND). DIRECTORATE OF SCIENTIFIC SERVICES.
Minor Elements in the Sediments of the Thames Estuary,
W80-03370 2J

TOKYO UNIV. (JAPAN). DEPT. OF FISHERIES.
Fundamental Studies on the Influence of Oil Pollution Upon Marine Organisms--IV the Toxicity of Mixtures of Oil Products and Oil-Spill Emulsifiers to Phytoplankton (In Japanese),
W80-03338 5C

TSUKIBA UNIV., IBARAKI (JAPAN). INST. OF BIOLOGICAL SCIENCES.
Impact of Nutrient Enrichment in a Waterchestnut Ecosystem at Takahama-Iri Bay of Lake Kasumigaura, Japan--I. Nutrient Influx and Phytoplankton Bloom,
W80-03467 5A

TUEBINGEN UNIV. (GERMANY, F.R.). LEHRBEREICH FUER SPEXIELLE BOTANIK.
Vegetation Zonation Around Freshwater Springs of the Maharlu Salt Lake Near Shiraz (Iran), Vegetationszonierung an Susswasserquellen des Maharlusalzsees Bei Shiraz (Iran),
W80-03537 2I

UNITED STATES STEEL CORP., PITTSBURGH, PA. (ASSIGNEE).
Process for the Separation of Foam from Effluents of Coke Oven Plants,
W80-03331 3E

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES. AND ARMY ENGINEER WATERWAYS EXPERIMENT STATION, VICKSBURG, MS.
Confined Disposal Area Effluent and Leachate Control (Laboratory and Field Investigations),
W80-03398 5E

UTAH WATER RESEARCH LAB., LOGAN.
Municipal Water Use,
W80-03551 6D

VIENNA UNIV. (AUSTRIA). INST. OF METEOROLOGY AND GEOPHYSICS.
One-Dimensional Transient Model for Short-Term Prediction of Downstream Pollution in Rivers,
W80-03461 5B

VIRGINIA INST. OF MARINE SCIENCE, GLOUCESTER POINT. DEPT. OF MICROBIOLOGY-PATHOLOGY.
Distribution, Abundance, and Petroleum-Degrading Potential of Marine Bacteria from Middle Atlantic Continental Shelf Waters,
W80-03538 5C

VIRGINIA UNIV., CHARLOTTESVILLE. DEPT. OF BIOLOGY.
The Contribution of Macrophytes to the Metalimnetic Oxygen Maximum in a Montane, Oligotrophic Lake,
W80-03533 2I

WATER RESEARCH COMMISSION, PRETORIA (SOUTH AFRICA).
The Placing of the Disinfection Stage in a Reclamation Plant to Reduce Haloform Formation,
W80-03324 5F

WESTERN AUSTRALIA DEPT. OF FORESTS, PERTH.
Management of Pinus Pinaster Plantations on the Swan Coastal Plain for Timber and Water Yield,
W80-03385 2I

WESTERN NEW ENGLAND COLL., SPRINGFIELD, MA.
Dam Safety: The Critical Imperative,
W80-03499 6E

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA. (ASSIGNEE).
Water Purification Method and Apparatus,
W80-03426 5D

WISCONSIN UNIV.-MILWAUKEE. CENTER FOR GREAT LAKES STUDIES.
Longevity and Reproduction of Daphnia Pulex (De Geer) Exposed to Cadmium-Contaminated Food or Water,
W80-03439 5A

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MA.
Hypsometry of the Continental Shelf off Eastern North America,
W80-03367 2L

WORLD HEALTH ORGANIZATION, WASHINGTON, DC. MALARIA ERADICATION DEPT.
Drainage and Larviciding for Control of a Malaria Focus in Haiti,
W80-03505 4C

WRIGHT STATE UNIV., DAYTON, OH.; AND OLD DOMINION UNIV., NORFOLK, VA.
Habitat Development Field Investigations, Windmill Point Marsh Development Site, James River, Virginia: Appendix F: Environmental Impacts of Marsh Development with Dredged Material: Sediment and Water Quality,
W80-03400 5E

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 13, NUMBER 11
JUNE 1, 1980

W80-03601 -- W80-03900
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the
Office of Water Research and Technology
U.S. Department of the Interior

LIBRARY U. S. [illegible]

VOLUME 13, NUMBER 11
JUNE 1, 1980

W80-03601 -- W80-03900

The Secretary of the U.S. Department of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most our our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographic citation and a set of identifiers or descriptors which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Office of Water Research and Technology.

To provide SWRA with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

The input from these Centers, and from the 54 Water Resources Research Institutes administered under the Water Research and Development Act of 1978, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies becomes the information base from which this journal is derived.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

AN ANALYSIS OF THE IRREVERSIBLE THERMODYNAMICS MODEL FOR COUPLED HEAT AND MOISTURE TRANSPORT PHENOMENA IN UNSATURATED POROUS MEDIA,
Arkansas Univ., Fayetteville. Dept. of Chemical Engineering.
J. A. Havens.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-149321, Price codes: A06 in paper copy, A01 in microfiche. Arkansas Water Resources Research Center University of Arkansas Publication No 67, Project Completion Report, January, 1980. 122 p, 42 Fig, 4 Tab, 111 Ref, 1 Append. OWRT A-042-ARK(2).

Descriptors: *Mathematical models, *Thermodynamic behavior, *Heat transfer, *Water temperature, Thermodynamics, Moisture content, Transfer, Model studies, Water transfer, Volumetric analysis, Gravimetric analysis, Porous media, Saturation.

The coupled heat and moisture transfer equations of the Irreversible Thermodynamics (IT) theory, attributed to Cary and Taylor, were numerically interpreted to predict steady-state temperatures and moisture content profiles for a sealed unsaturated system. The system was a one-dimensional spherical unit of distilled water-unsaturated glass beads (210 to 298 microns) that was subjected to known heat flux rates. Model predictions were compared with measured moisture and temperature profiles from an experimental investigation. Model development is discussed including the thermodynamics of irreversible processes, transport equations, solution techniques, and measurement of transport coefficients. For the experimental investigation two concentric spheres were mounted on a support stand with a heater encased in the inner sphere. This entire system was enclosed in a constant temperature air bath. Thermocouples and a potentiometric recorder were used to monitor temperatures. Gravimetric analyses of samples extracted from three locations were used to measure moisture content. Eleven experimental runs were performed and analyzed and profiles of the results are given. Comparison of these data with model predictions show the validity of the IT approach. The moisture content gradient to heat flux coupling coefficient was small and a negligible heat flux was associated with the moisture content gradient. A brief historical and literature review is included. (Seigler-IPA)

STRUCTURAL CONTROLS OF HOT-SPRING SYSTEMS IN SOUTHWESTERN MONTANA,
Montana State Univ., Bozeman; and Geological Survey, Helena, MT. Water Resources Div.
R. A. Chadwick, and R. B. Leonard.
Available from: OFSS BX 25425, Fed. Ctr. Denver CO printed copy $3.50 microfiche $3.50. Geological Survey open-file report 79-1333, September 1979. 25 p, 4 Fig, 1 Tab, 53 Ref.

Descriptors: *Structural geology, *Hot springs, *Montana, *Geothermal studies, *Faults(Geologic), Thermal water, Thermal springs, Fractures(Geologic), Rocks, Conduits, Aquifers, Water temperature, *Southwest Montana.

Thermal waters that issue as hot (more than 38C) springs in southwestern Montana appear to circulate to depth along Cenozoic block faults, deep fractures penetrating the dominantly crystalline rock crust, or major structural lineaments. At individual hot springs, rising thermal waters are transmitted along conduits formed by the intersection of a major fault with other faults, fracture zones, anticlinal axes (which may be faulted or fractures), or sedimentary aquifers. Step faults and other intra-valley faults may influence circulation at some springs. At others, fracture zones alone may provide the necessary vertical permeability. Normal regional heat apparently is sufficient to maintain the hydrothermal systems without enhancement from cooling igneous bodies. The thermal gradient normally is higher in low thermal conductivity sediments of the block-fault valleys than the 30C per kilometer average for crystalline rock. To attain reservoir temperatures of 60 to 120C indicated by chemical geothermometers, waters would have to circulate to depths of about 2 to 4 kilometers in crystalline rock and about 1 to 2 kilometers in valley sediments. (Kosco-USGS)

METHODS OF ESTIMATING SOME POSSIBLE INTERACTIONS OF AGRICULTURAL DEVELOPMENT AND WATER RESOURCES IN ALASKA,
Alaska Univ., Fairbanks. Inst. of Water Resources.
J. D. Fox, Jr., and J. D. LaPerriere.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-152853, Price codes: A02 in paper copy, A01 in microfiche. Completion Report 77-22-B, January 1980. 14 p, 16 Ref. OWRT A-062-ALAS(1), 14-34-0001-8002.

Descriptors: *Alaska, *Model studies, *Environmental effects, *Land clearing, *Agriculture, Barley, Water quality, Water pollution, Fertilizers, Irrigation effects.

Currently, some 53,000 acres of land in the Clearwater Creek watershed (near Delta Junction, Alaska) are being cleared for intensive barley production. Several uncertainties exist with respect to crop water balance, pesticide and fertilizer transport, and effects of irrigation on groundwater and stream levels. Furthermore, there is a general sparcity of site-specific data. This project was to investigate the utility of modeling and simulation to estimate possible interactions of water resources and agricultural development. Many models proved inappropriate for the environmental extremes of Alaska. In addition, excessive time, money and effort were often required to transfer large, comprehensive models from other parts of the country into working tools for this project. An alternative approach using specific, problem-oriented models written in CSMP language proved useful, as well as a mathematically simple water balance accounting model. These models were applied to specific questions of crop water balance and leaching for the Delta-Clearwater project area. Field data were collected on crop water use and also on benthic algae and macroinvertebrates of Clearwater Creek. General guidelines on data collection and utilization were established to aid state agencies charged with monitoring and managing agricultural development.

THE GEOMORPHOLOGIC STRUCTURE OF HYDROLOGIC RESPONSE,
Universidad Simon Bolivar, Caracas (Venezuela).
I. Rodriguez-Iturbe, and J. B. Valdes.
Water Resources Research, Vol 15, No 6, p 1409-1420, December 1979. 8 Fig, 14 Ref.

Descriptors: *Watersheds(Basins), *Geomorphology, *Rainfall, *Runoff, *Model studies, Mathematical models, Hydrologic properties, Rainfall-runoff relationships, Streamflow, Hydrographs, Unit hydrographs, Synthetic hydrology, Hydrology, Hydrologic response, Geomorphic structure.

A unifying synthesis of the hydrologic response of a catchment to surface runoff was attempted by linking the instantaneous unit hydrograph (IUH) with the geomorphologic parameters of a basin. Equations of general character were derived which express the IUH as a function of Horton's numbers R sub A, R sub B, and R sub L; an internal scale parameter L sub omega; and a mean velocity of streamflow nu. The IUH is time varying in character both throughout the storm and for different storms. This variability is accounted for by the variability in the mean streamflow velocity. The underlying unity in the nature of the geomorphologic structure is thus carried over to the great variety of hydrologic responses that occur in nature. An approach was initiated to the problem of hydrologic similarity. (Sims-ISWS)
W80-03743

HYDROLOGIC DATA FOR WELLS, SPRINGS, AND STREAMS IN BOULDER COUNTY, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
D. C. Hall, E. L. Boyd, and D. Cain.
Available from: OFSS BX 25425, FED. CTR. Denver, CO printed copy $16.00 microfiche $4.00. Geological Survey open-file report 79-979, November 1979. 106 p, 7 Fig, 1 Plate, 5 Tab, 4 Ref.

Descriptors: *Hydrologic data, *Data collections, *Colorado, *Groundwater, *Surface waters, Wells, Springs, Streams, Water quality, Sampling, Sites, Water temperature, Streamflow, Water analysis, Sewage treatment, *Boulder County(Colo).

Hydrologic data collected in 1975-77 as part of a comprehensive water-resources investigation of Boulder County, Colo., by the U.S. Geological Survey in cooperation with the Boulder County Health Department and the Colorado Geological Survey are presented in this report. The data, in tabular and graphic form, consist of water-quality analyses of selected constituents and geohydrologic-site, water-treatment, and sewage-treatment data for 609 wells and 48 springs; water-quality analyses for 102 of the wells and 9 of the springs; water-quality analyses of streamflow from 34 sites; and specific conductance and water-temperature measurements of streamflow from 3 sites. State and local officials in Boulder County may find these data useful in planning for residential, commercial, and industrial development. (Kosco-USGS)
W80-03757

WATER-QUALITY ASSESSMENT OF THE L'ANGUILLE RIVER BASIN, ARKANSAS,

THE RELEASE OF REACTIVE PHOSPHATE BY A POSIDONIA AUSTRALIS SEAGRASS COMMUNITY,
Commonwealth Scientific and Industrial Research Organization, Cronulla (Australia). Div. of Fisheries and Oceanography.
H. Kirkman, F. B. Griffiths, and R. R. Parker.
Aquatic Botany, Vol 6, No 4, p 329-337, August 1979. 2 Fig, 1 Tab, 5 Ref.

Descriptors: *Phosphates, *Rooted aquatic plants, *Estuarine environments, *Seagrass, *Port Hacking, Australia, Submerged plants, Posidonia australis, Estuaries, Detritus, Phosphorus compounds, Nutrients, Plant physiology, Water chemistry, Biochemistry, Leaves, Epiphytes, Tides, Diffusion, Metabolism.

Reactive phosphate is released into water over the seagrass Posidonia australis in a sunken river valley South West Arm of Port Hacking, Australia, both day and night; the reactive phosphate enters the water column either by diffusion or tidal flow mechanisms. No release occurs over surrounding unvegetated areas. A series of experiments were conducted to determine if Posidonia plants were the agents by which reactive phosphate was moved from interstitial substrate water to the water column. Two 1 sq m aluminium boxes without tops or bottoms were placed over seagrass beds. Each box enclosed about 330 Posidonia shoots. Plants in one box were individually enclosed in plastic bags so that the water in the bags did not mix with water in the box. Water samples were taken at 15 min intervals over 24 hours. Box experiments show simil increases in reactive phosphate for both covered and uncovered plants. Thus Posidonia plants are not responsible for phosphate release. It is postulated, instead, that the seagrass bed releases reactive phosphate through microbiological remineralization of detritus accumulation from the water column, seagrass leaves and epibiota. Release rates vary 0.055-0.17 micro g - at P/h g leaf dwt. (Harris-Wisconsin)
W80-03808

2B. Precipitation

STATISTICAL ANALYSIS OF HYDROLOGIC CRITICAL DROUGHTS,
Technical Univ. of Istanbul (Turkey). Dept. of Hydrology and Water Power.
For primary bibliographic entry see Field 2E.
W80-03618

FORECASTING STORM RAINFALL OVER BHAGIRATHI CATCHMENT DUE TO DEPRESSIONS/CYCLONIC STORMS,
Meteorological Office, New Delhi (India).
G. R. Gupta, K. K. Srivastava, H. C. Mehra, and T. C. Jasra.
Mausam, Vol 30, No 1, p 139-156, January 1979. 7 Fig, 7 Tab, 4 Ref.

Descriptors: *Storms, *Rainfall, *Forecasting, *Floods, Flood forecasting, Precipitation(Atmospheric), Watersheds(Basins), Rain gages, Networks, Weather, Climatology, Meteorology, *India, *Bhagirathi River(India).

Synoptic typing of systems contributing rainfall in catchment areas were found to be a useful technique in quantitative precipitation forecasting. This paper contained detailed analysis of 68 rainstorm situations with one-day rainfall of 2.5 cm or more over the Bhagirathi catchment during the period 1901-1967 in association with depressions/cyclonic storms. An attempt was made in this paper to: (1) estimate the contribution of rainfall over the catchment vis-a-vis the location of the system; (2) estimate the intensities of the rainfall vis-a-vis the intensities of the causative systems, namely depressions/cyclonic storms; (3) determine the time interval between the origin of the system and its movement to an effective location to cause rainfall over the catchment; (4) make quick assessment of average areal rainfall over the catchment on the basis of rainfall data from selected key stations, using regression equation; and (5) maximize the highest rainstorm of September 26, 1956, by moisture charge method. (Sims-ISWS)
W80-03635

ON THE ASSESSMENT OF CROP DROUGHTS: A CASE STUDY FOR DISA (GUJARAT),
Meteorological Office, Poona (India).
S. Venkataraman.
Mausam, Vol 30, No 1, p 123-128, January 1979. 1 Fig, 4 Tab, 10 Ref, 1 Append.

Descriptors: *Droughts, *Crops, *Evapotranspiration, *Rainfall, Soil moisture, Evaporation, Arid lands, Climatology, Agroclimatology, Agriculture, Meteorology, *India.

The comparative nature of meteorological drought studies was pointed out. A monthly rainfall-cum-two-layer soil model to arrive at the ratio of actual water transpired by a ground-shading crop to the potential transpiration need was presented. The use of such ratios for characterizing the drought situations for a reasonably parameterized crop was explained. A case study for Disa station in Gujarat was presented. (Sims-ISWS)
W80-03637

DOES PRECIPITATION PATTERN FORETELL GUJARAT CLIMATE BECOMING ARID,
Meteorological Office, Poona (India).
A. Chowdhury, and V. P. Abhyankar.
Mausam, Vol 30, No 1, p 85-90, January 1979. 2 Fig, 5 Tab, 4 Ref.

Descriptors: *Rainfall, *Monsoons, *Analysis, Time series analysis, Climates, Arid climates, Precipitation(Atmospheric), Climatology, *India, *Gujarat State(India).

In recent years on account of the anomalous behavior of southwest monsoon, drought conditions were reported from many parts of the country, Gujarat State in particular. An attempt was made in this paper to determine if Gujarat is turning drier. Southwest monsoon (seasonal) and the annual rainfall series of nearly 70 years were subjected to sophisticated statistical analyses. Rainfall data over Gujarat was found to constitute a random series and did not exhibit presence of trend, cycle, or persistence. The precipitation pattern did not indicate that arid conditions are gradually increasing over Gujarat State. It also was not feasible to anticipate years of poor rainfall from the past occurrences in the rainfall series. (Sims-ISWS)
W80-03638

A RAINFALL SIMULATOR WITH NONREPETITIOUS MOVEMENT OF DROP OUTLETS,
Science and Education Administration, Riverside, CA. Salinity Lab.
W. B. Kleijn, J. D. Oster, and N. Cook.
Soil Science Society of America Journal, Vol 43, No 6, p 1248-1251, November-December 1979. 3 Fig, 1 Tab, 7 Ref.

Descriptors: *Rainfall simulators, *Simulated rainfall, *Equipment, *Laboratory equipment, Rainfall, Precipitation intensity, Particle size, Drops(Fluids), Engineering, Meteorology, Soil science, Drop-size distributions.

Problems encountered in simulating uniform rainfall inside the laboratory were discussed. A new rain simulator was described which eliminates nonuniformity by a non-repeating movement of drop outlets. The model tested applies rain to a ring-shaped area of 0.21 sq m with a coefficient of variation of about 7%. By using drop outlets of different sizes, one also can adjust the raindrop size distribution. (Sims-ISWS)
W80-03726

2C. Snow, Ice, and Frost

HYDRAULIC CONDUCTIVITY OF MOUNTAIN SOILS,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
O. R. Williams, L. Ponce, R. Meiman, and M. Spearnak.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153455, Price codes: A04 in paper copy, A01 in microfiche. Colorado Water Resources Research Institute, CO. State Univ., Completion Report No. 92, Sept. 1978. 52 p, 21 Fig, 8 Tab, 31 Ref. OWRT A-032-COLO(1), 14-34-0001-6000.

Descriptors: *Hydraulic conductivity, *Snowmelt runoff, Subalpine watershed, Litterflow, Water conservation, Percolation, *Mountains, Coniferous forest, Forest watersheds, *Soil water movement.

Pathways and rates of delivery of snowmelt runoff from a subalpine conierous forest watershed were studied through the examination of saturated hydraulic conductivity, soil moisture tension and litterflow measurements. Measurements were taken from litterflow collectors and our soil pits 2.5 meters deep located on north and south aspects. During the period of snowmelt, runoff was carried as surface and near-surface flow in the litter layer and upper 4-5 cm of mineral soil. Saturated or near-saturated flow occurred at the base of the soil pits. The majority of the soil profile transmitted soil moisutre as unsaturated flow. Hydraulic conductivity determinations indicated that under saturated conditions the potential percolation through the soil mass would generally be in excess of the normal snowmelt rate.
W80-03775

2D. Evaporation and Transpiration

MEASURING EVAPOTRANSPIRATION OF TURFGRASS,
Colorado State Univ., Fort Collins. Dept. of Agronomy.
C. M. Feldhake.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-152051, Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, 1979. 56 p, 7 Fig, 5 Tab, 26 Ref, Append. OWRT A-043-COLO(1), B-035-WYO(5).

Descriptors: *Evapotranspiration, *Turfgrasses, *Kentucky bluegrass, *Lawns, Lysimeters, Urban lawns, Growth chamber, Canopy temperature, Infrared thermometer, Thermal emissivity.

Evapotranspiration (ET) of Kentucky bluegrass (Poa pratensis L) was measured in urban lawns, in a growth chamber and as part of a study relating canopy temperature to water stress. Lysimeters 30.5 cm in diameter, were used to measure ET. Lack of control over urban lawn sites restricted the reliability of relating ET to microclimate. In the growth chamber study, ET was influenced by day temperature, night temperature, clipping height and soil texture. It was shown that soils high in clay are not desirable for use in lysimeters due to limited root growth. Average midday canopy temperature was more reliable at identifying water stress than daily ET measurements using lysimeters. Canopy temperature measurements, using an infrared thermometer, were utilized without correcting for canopy quality differences since the thermal emissivity of lush, green turf and dead, brown turf was found to be the same. The Barnes 14-220 infrared thermometer was calibrated and it's scale was found to be 8% high for the 0-50C range.

THERMAL MODELING OF HIGHLY TRANSIENT FLOWS IN THE CHATTAHOOCHEE RIVER NEAR ATLANTA, GEORGIA,
Geological Survey, NSTL Station, MS.
H. E. Jobson, and T. N. Keefer.
In: River-Quality Assessments; Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. p 125-141, 1978. 6 Fig, 5 Ref.

Descriptors: *Thermal water, *Model studies, *Georgia, *Rivers, Water temperature, Streamflow, Routing, Mathematical models, Thermal pollution, Heat transfer, Heat balance, Tracers, Calibrations, Flow, Analytical techniques, Unsteady flow, On-site investigations, *Chattahoochee River(GA).

Coupled flow, temperature, and transport models have been developed and verified by use of two extensive sets of data collected under highly unsteady flow conditions on a 27.9 km reach of the Chattahoochee River between Buford and Norcross, Georgia. Existing solution techniques, with

minor improvements, were applied to verify flow and transport modeling concepts. A linear-implicit finite difference flow model was calibrated by use of a depth profile obtained during steady low flow and unsteady flow data obtained during March 1976. The flow model was verified by use of dynamic stage and discharge data obtained in October 1975. The verification results were considered to be very good, particularly for flows of less than 100 cu m/s. Dye was added to the upstream end of the river reach at a constant rate while the river flow was highly unsteady. The transport model closely simulated observed dye concentrations in the river. Even without calibration the temperature model was capable of predicting temperature changes through the reach of as large as 5.8C with a root-mean-square error of 0.32C in October 1975 and 0.20C in March 1976. Hydropulsation has a significant effect on the water temperature below Buford Dam. These effects are very complicated because they are quite dependent on the timing of the release with respect to both the time of day and past releases. (See also W80-03606) (Humphreys-ISWS)

OPTIMIZATION OF UNIT HYDROGRAPH DETERMINATION,
Texas Univ. at Austin. Dept. of Civil Engineering.
L. W. Mays, and L. Coles.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, p 85-97, Proceedings Paper 15129, January 1980. 3 Fig, 5 Tab, 12 Ref, 2 Append.

Descriptors: *Unit hydrographs, *Rainfall, *Runoff, *Optimization, *Mathematical models, Model studies, Hydrographs, Synthetic hydrology, Computers, Computer programs, Linear programming, Precipitation(Atmospheric), Rainfall-runoff relationships, Hydrology.

A linear programming model was developed for the optimal determination of unit hydrographs. The model determines the best unit hydrograph by minimizing the sum of deviation between observed and calculated runoff hydrographs. The principles of linearity and superposition of unit hydrograph theory are the basis of the model. Several multi-period rainfall events can be considered simultaneously for the optimal unit hydrograph determination. The model was tested using both hypothetical and actual rainfall events. STATISTICAL ANALYSIS OF HYDROLOGIC CRITICAL DROUGHTS,
Technical Univ. of Istanbul (Turkey). Dept. of Hydrology and Water Power.
Z. Sen.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15134, p 99-115, January 1980. 16 Fig, 3 Tab, 8 Ref, 2 Append.

Descriptors: *Droughts, *Stochastic processes, Statistical methods, Probability, Statistics, Markov processes, Analytical techniques, Analysis, Rivers, Flow, Hydrology, *Statistical analysis, Random variables.

Analytical formulations of critical droughts either as longest drought duration or maximum deficit sum were derived by making use of the theories of random number of random variables and runs. The results obtained are valid for independent and lag-one Markov processes only. The numerical solution of derived analytical expressions yields any order of statistical moments, the most important one is the expected value of critical droughts. It was quantitatively observed that the drought duration and severity are dependent on the correlation structure, sample size, and truncation level. (Sims-ISWS)

ON THE CALCULATION OF THE WIDTH AVERAGED FLOW DUE TO LONG WAVES IN AN OPEN CHANNEL,
Victoria Univ. of Manchester (England). Simon Engineering Labs.
T. J. Smith, and H. S. Takhar.
Journal of Hydraulic Research, Vol 17, No 4, p 329-340, 1979. 7 Fig, 22 Ref.

Descriptors: *Turbulent flow, *Estuaries, *Turbulent boundary layers, Hydraulics, Waves(Water), Open channel flow, Open channels, Velocity, Equations, Shear, Stress, Mathematical models, Analytical techniques, Analysis, Laboratory tests, Flow, *Turbulence energy closure models, Width-average flow, Long waves.

This paper described the use of mean turbulence energy closure models for the calculation of the vertical structure of the width-averaged flow due to the propagation of long waves in an open channel of constant width and rectangular cross section. Two turbulence models were considered which required the solution of one or both of the differential equations governing the turbulence energy and its dissipation rate. Numerical solutions were obtained for the motion induced by long waves in a laboratory channel and in the Humber Estuary. The computed values of surface velocity and bed shear stress in the laboratory channel were found to agree well with observed values. The calculation procedure also accurately reproduced the vertical structure of the tidal flow in the Humber Estuary. Existing theoretical relationships for the bed shear stress under long waves were verified by the numerical calculations, and a distribution of the dissipation length scale, postulated on physical grounds, was also confirmed. It was concluded that turbulence models of this type represent powerful research tools for the study of long waves, especially those which occur in nature. (Lee-ISWS)

TURBULENCE MEASUREMENTS IN THE BOUNDARY LAYER OVER A SAND WAVE FIELD,
Washington Univ., Seattle. Dept. of Oceanography.
S. R. McLean, and J. D. Smith.
Journal of Geophysical Research, Vol 84, No C12, p 7791-7808, December 20, 1979. 17 Fig, 5 Tab, 22 Ref. DOE EY-76-S-06-2225 TA 25, NSF GA14178.

Descriptors: *Turbulence, *Sand waves, *Rivers, *Columbia River, Measurement, Current meters, Flow, Beds under water, River beds, Stress, Streamflow, Boundary layers, Data processing, Analytical techniques, Hydrology, Power spectra.

To assist in elucidating the turbulent structure of flow over regular sets of bed forms, data procured with small mechanical current meters above 2 m high, 96 m long sand waves in the Columbia River were analyzed. The high frequency resolution of the flow sensors and the half hour records that were collected with them were shown to be sufficient to yield reliable Reynolds stresses. In addition, an expression from which the sampling error in Reynolds shear stresses can be estimated from the sampling frequency, the local flow speed, and the distance from the boundary was presented. Although the kappa to the (-5/3) power region of the energy spectrum was found, the conditions for isotropy were not satisfied anywhere within the measured band. Spatial structure of the Reynolds stress components was found to be complicated in character but explicable in basic fluid mechanical terms. Owing to the near boundary effects of form drag induced by the sand waves, the spatially averaged shear stress increased from 20 dyn/sq cm at 35 cm to 40 dyn/sq cm at 100 cm. Furthermore, the Reynolds shear stress was found to vary with the structure of the variance of the vertical velocity component rather than with that of turbulent kinetic energy as assumed in the simple closure models that have been used so far in theories for flow over such bed forms. HYDRAULICS OF FLOW IN THE KASKASKIA RIVER, ILLINOIS,
Illinois State Water Survey, Urbana.
N. G. Bhowmik.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153448, Price codes: A06 in paper copy, A01 in microfiche. ISWS Report of Investigation 91, 1979. 116 p, 73 Fig, 13 Tab, 46 Ref, 2 Append.

Descriptors: *River flow, *Flow characteristics, *Illinois, *On-site investigations, Open channel flow, Streambeds, Data collections, Low flow, Roughness(Hydraulic), Head loss, Hydraulics, Meanders, On-site tests, Geomorphology, Particle size, Bottom sediments, Velocity, Flow profiles, Spatial distribution, Water circulation, Discharge(Water), Analytical techniques, Analysis, *Kaskaskia River(IL), Pools, Riffles, River bends.

The hydraulics of flow was investigated at two reaches in the Kaskaskia River. Hydraulic data were collected for 58, 1040, 1420, and 4000 cfs from Reach 1 below Lake Shelbyville and for 290, 2160, and 3700 cfs from Reach 2 below Carlyle Lake. The flow frequencies varied from 5 to 88%. In all, 79 bed and bank material samples were collected and analyzed to determine the particle size distribution. In all cases, the flow can be approximated by uniform flow equations. Head loss varied from 0.96 ft/mile for high flows to 1.98 ft/mile for low flows. The vertical velocity distribution was found to follow a logarithmic distribution. The average velocity at 0.5 foot above the bed was approximately 95% of the average velocity in the cross section. Altogether 79 isovels, or lines of equal velocity, in the cross sections were developed on the basis of the hydraulic data collected in the field. The ratio of the maximum velocity to the average velocity remained almost unchanged for low, medium, and high flows. In a few cross sections, a considerable amount of bed scour took place during high flows. A theoretical distribution was found to predict the lateral velocity distribution in the bends satisfactorily. The average value of the energy coefficient was 1.45 for straight reaches and 1.43 for bends. Similarly, the average value of momentum coefficients was 1.22 for straight reaches and 1.18 for bends. Average Manning's roughness coefficients varied from a minimum of 0.039 to a maximum of 0.053. During low flows, the Kaskaskia flows through a series of pools and riffles with larger diameter bed materials in the riffle and fine materials in the pool. The median diameter varied from 40 mm in the riffle to 0.04 mm in the pool. The Froude number varied from 0.7 in the riffle to 0.01 in the pool. Head loss was about 2.48 ft/mile in one pool-riffle sequence and about 4.44 ft/mile in another. During high flows, the pools and riffles are all submerged, and their effects on the overall flow condition are minimal or nonexistent. (Humphreys-ISWS)

A GENERALIZED APPROACH TO KINEMATIC FLOOD ROUTING,
McMaster Univ., Hamilton (Ontario). Dept. of Civil Engineering and Engineering Mechanics.
A. A. Smith.
Journal of Hydrology, Vol 45, No 1/2, p 71-89, January 1980. 5 Fig, 1 Tab, 13 Ref.

Descriptors: *Flood routing, *Flood waves, *Model studies, Mathematical models, Flow, Water levels, Streamflow, Storage, Reservoirs, Reservoir storage, Flood profiles, Computer models, Equations, Analytical techniques, Hydrology, Kinematic flood routing.

The development of the kinematic wave flow routing equation was presented briefly, and certain of the fundamental conditions necessary for its successful application were discussed. A general algorithm was proposed, and several methods of kinematic routing in common usage were shown to be special cases of the algorithm. The performance of the finite-difference scheme was examined with respect to stability and convergence; truncation error was shown to be independently sensitive to weighting factors in the space and time dimensions. From this an explicit relationship was developed between these weighting factors and the numerical attenuation of the wave. Confirmatory evidence from numerical experiments was presented. Comparison with the diffusion form of the equation showed how the diffusion coefficient may serve to relate the space and time weighting factors and the physical properties of the channel system. Application to nonprismatic or natural channels was discussed. Finally, implementation of the algorithm in computer routines for the routing of flood waves in natural channels was discussed, including a recent development in which the weighting factors are made time dependent. ON THE MAGNITUDE OF INTERFACIAL SHEAR OF SUBCRITICAL STRATIFIED FLOWS IN RELATION WITH INTERFACIAL STABILITY,
Waterloopkundig Lab., Delft (Netherlands).
G. Abraham, M. Karelse, and A. G. van Os.
Journal of Hydraulic Research, Vol 17, No 4, p 273-287, 1979. 6 Fig, 2 Tab, 28 Ref.

Descriptors: *Stratified flow, *Subcritical flow, *Interfaces, *Model studies, Flow, Stability, Flow characteristics, Density currents, Boundary processes, Saline water-freshwater interfaces, Saline water intrusion, Mathematical models, Laboratory tests, Analytical techniques, Shear, Steady flow, Locks, Navigation, Water temperature, Two-layer flow, Salt wedge, Temperature surface wedge.

This paper elaborated upon the reasons why subcritical stratified flows may be treated as two-layer flows without mixing. The following stratified flow phenomena may be characterized as subcritical steady stratified flows: (1) arrested salt wedge, (2) temperature surface wedge, and (3) density-induced return currents. In internal mixing processes distinction must be made between the role of internal waves and turbulence. An important property of turbulence is its ability to transport quantities such as salt or heat across surfaces of constant density. There is little connection between the turbulent motion at well separated points in the fluid, and turbulent energy propagates slowly, with the speed of the fluid motion. Waves, on the other hand, may distort the density distribution to produce an apparent, transient layering, but they cannot permanently change the stratification unless they break to produce turbulence. They transfer energy more rapidly through the fluid, varying only gradually as they do so. The conditions at the interface between the two layers of a subcritical stratified flow were considered on the basis of linear instability theory. It was shown that in subcritical stratified flows there is a tendency towards the development of an intermediate layer. This intermediate layer was shown to have a stabilizing effect as it eliminates instability of internal waves. Apparently it also reduces turbulence, as follows from the fact that the considered subcritical stratified flows may be treated as two-layer flows without mixing. The interfacial shear coefficient is likely to vary with the stage of development of the intermediate layer. Further, a summary of experimental data on the interfacial shear was given. The different types of subcritical stratified flows were treated separately as the significance of turbulence generated at the interface in comparison with turbulence generated at the bottom, and vice versa, varies with the type of stratified flow. HYDRAULICS OF RECTANGULAR VERTICAL DROP STRUCTURES,
Ahmadu Bello Univ., Zaria (Nigeria). Dept. of Civil Engineering.
M. A. Gill.
Journal of Hydraulic Research, Vol 17, No 4, p 289-302, 1979. 8 Fig, 4 Tab, 9 Ref.

Descriptors: *Spillways, *Structures, *Hydraulic structures, *Irrigation canals, Canals, Canal design, Hydraulics, Flow, Velocity, Channel flow, Equations, Model studies, Reviews, *Vertical drop spillways, Free drop structures.

Previous works of Moore, White, and Rand on the characteristics of the free overfall drop structures were briefly reviewed. A simple theory initially proposed by White was modified by introducing less drastic assumptions than the ones on which White's theory is based. The resulting theory is in closer agreement with experiment and the empirical equations of Rand than is White's theory. Experimental results were also given on the brink depth as an appendix. HYDRAULICS OF A LARGE CHANNEL PAVED WITH BOULDERS,
Ministry of Works and Development, Wellington (New Zealand). Power Div.
S. M. Thompson, and P. L. Campbell.
Journal of Hydraulic Research, Vol 17, No 4, p 341-354, 1979. 7 Fig, 4 Tab, 17 Ref.

Descriptors: *Open channels, *Channels, *Open channel flow, Boulders, Hydraulics, Channel morphology, Channel improvement, Friction, Flow, Equations, *Loose boulders, Darcy friction coefficient, Channel stability.

Experience was described of a 41 m wide by 308 m long, open channel on a 0.052 slope, constructed of loose boulders and through which flows up to 140 cu m/sec are passed. A new expression for the Darcy friction coefficient was proposed with a theory based on published laboratory data. This equation was shown to fit the large channel and other published field data. Some observations were made on both the geometry and the stability of the paving. (Lee-ISWS)

A TECHNIQUE FOR ESTIMATING HEIGHTS REACHED BY THE 100-YEAR FLOOD ON UNREGULATED, NONTIDAL STREAMS IN NORTH CAROLINA,
Geological Survey, Raleigh, NC. Water Resources Div.
R. W. Coble.
Geological Survey Water-Resources Investigations 79-69 (open-file report), July 1979. 14 p, 9 Fig, 2 Ref.

Descriptors: *Analytical techniques, *Peak discharge, *Floods, *Streams, *North Carolina, Flood recurrence interval, Forecasting, Estimating, Streamflow, Gaging stations, Drainage area, Regression analysis, Flood profiles, Maps, Appalachian Mountain region, Coastal Plains, *Piedmont.

A method for estimating heights reached by floods having a recurrence interval of 100 years is defined for nontidal streams with unregulated flows in North Carolina. The flood heights are the vertical distance between stream stage at median discharge (50 percent duration) and the 100-year flood stage and are defined for streams draining areas between 1 and 10,000 square miles. A flood-height drainage-area relation was determined by regression analysis for each of the three physiographic areas of the State; mountains, Piedmont and Coastal Plain. An illustrated example of how the method can be used in conjuction with topographic maps to estimate flood heights and delineate inundated areas by interpolation is given. (Kosco-USGS)

LOW-FLOW CHARACTERISTICS OF STREAMS IN THE PECATONICA-SUGAR RIVER BASIN, WISCONSIN,
Geological Survey, Madison, WI. Water Resources Div.
D. A. Stedfast.
Geological Survey open-file report 79-1274 (WRI), August 1979. 92 p, 6 Fig, 2 Plates, 3 Tab, 17 Ref.

Descriptors: *Low flow, *Flow characteristics, *Streamflow, *Low-flow frequency, *Wisconsin, Watersheds(Basins), Streamflow forecasting, Base flow, Analytical techniques, Regression analysis, Gaging stations, Evaluation, *Pecatonica-Sugar River basin(Wis).

Low-flow characteristics of streams in the Pecatonica-Sugar River basin in Wisconsin are presented in tables. Included are estimates of low-flow frequency and flow duration at 11 gaging stations; low-flow frequency characteristics at 25 low-flow partial-record stations and 63 miscellaneous sites; and a list of base-flow discharge measurements at 160 miscellaneous sites. Equations are provided to estimate low-flow characteristics at sites without discharge measurements and at sites where one base-flow discharge measurement is available. The equations were determined from multiple-regression analyses that related low-flow characteristics at gaging stations and low-flow partial-record stations to basin characteristics. The standard error of estimate is provided for each method of estimating the low-flow characteristics. Standard error provides the user with the expected degree of accuracy for each method. (Kosco-USGS)

A PARAMETRIC MODEL CALIBRATED WITH A PHYSICALLY BASED MODEL FOR RUNOFF PREDICTION FROM UNGAGED STREAMS,
Battelle Pacific Northwest Labs., Richland, WA.
F. W. Bond, D. L. Chery, Jr., and E. S. Simpson.
Water Resources Bulletin, Vol 15, No 6, p 1640-1652, December 1979. 6 Fig, 8 Ref.

Descriptors: *Runoff, *Surface runoff, *Model studies, *Mathematical models, Streamflow, Watersheds(Basins), Calibrations, Rainfall, Hydrographs, Forecasting, Hydrology, Ungaged streams, Runoff prediction, Surface flow modeling.

Recent developments in the numerical solution of the governing partial differential equations for overland and channel flow should make possible physically based models that predict runoff from

ungaged streams. However, these models, which represent the watershed by sets of intersecting planes, are complex and require much computer time. Parametric models exist that have the advantage of being relatively simple, and once calibrated are inexpensive to use and require limited data input. In this study, a procedure was developed for calibrating a parametric model against a physically based model, utilizing base areas of one acre and one square mile, with the expectation that base areas can be combined to model real watersheds. Simulation experiments with the physically based model showed that for the one-acre base area, the dominant parameter (cell storage ratio, K) related to the slope and friction of the planes, whereas for one-square-mile areas, the dominant parameters (K plus a lag factor, L) relate to channel properties. These parameters decreased exponentially as rainfall intensity increased. (Sims-ISWS)

COMPARATIVE STUDY OF GROUNDWATER RECHARGE RATES IN PARTS OF INDO-GANGETIC AND SABARMATI ALLUVIAL PLAINS,
Physical Research Lab., Ahmedabad (India).
P. S. Datta, B. I. Desai, and S. K. Gupta.
Mausam, Vol 30, No 1, p 129-133, January 1979. 4 Fig, 2 Tab, 15 Ref.

Descriptors: *Groundwater, *Recharge, *Groundwater recharge, *Soil water movement, Rainfall, Irrigation, Soil water, Aquifers, Tracers, Tritium, Evapotranspiration, Runoff, Mathematical models, On-site investigations, *India.

Tritium-tracing data of soil moisture movement for groundwater recharge estimation from four river basins in India were examined. Of the two commonly used empirical formulae, namely, Amritsar and Chaturvedi formulae, the former gives consistently higher estimate of groundwater recharge in all four regions. The Chaturvedi formula gives reasonable estimates of groundwater recharge for sandy loam soils in parts of Indo-Gangetic plains, but gives significantly higher values of groundwater recharge for similar soils in Sabarmati basin. For each basin based on tritium tracing of soil moisture movement, empirical relations were developed to estimate regional groundwater recharge. Since the hydrometeorological factors vary significantly from basin to basin and within parts of a basin, it is desirable to investigate each region individually. (Sims-ISWS)

Descriptors: *Natural recharge, *Artesian aquifers, *Tritium, Groundwater movement, Dating, Recharge, Spring waters, New Mexico, Perched aquifer, *Spring flow, Deep flow, Paul Spring(NMex), Roswell(NMex).

Paul Spring is the principal or sole discharge point of a perched localized aquifer of well defined boundaries. It is located on the western flank of the Roswell artesian basin, and conditions at Paul Spring are considered typical for a major portion of the basin. The recharge at Paul Spring could therefore provide insight into the recharge mechnisms controlling the basin's groundwater supply. The geology of the area was mapped in detail. Springflow was measured over a span of 453 days. Precipitation records of many years were available from a NOAA weather station in the area. Tritium was measured in spring discharge and precipitation. Numerical and stochastic analysis and cross-correlation were performed on the data. The results suggest that a deep flow component plays an important role, hitherto underestimated, in the groundwater recharge to the basin. This deep component is transmitted by the Permian Yeso Formation and the Glorieta Sandstone Member of the San Andres Formation. At Paul Spring, this accounts for as much as 80% of the discharge. No clear results were obtained for the Paul Spring aquifer's response time to precipitation events. The indications are that it is of the order of several months. This can be explained by the peculiar geologic structure, specifically the screening effect of the Glorieta sandstone, in combination with solution and collapse features in the Yeso formation which channel the recharge water. A longer series of springflow measurements under better controlled conditions is needed to clarify this problem. (Herman-NMex)

HYDROLOGY OF SMALL OCEANIC ISLANDS--UTILITY OF AN ESTIMATE OF RECHARGE INFERRED FROM THE CHLORIDE CONCENTRATION OF THE FRESHWATER LENSES,
Washington State Univ., Pullman. Dept. of Geology.
H. L. Vacher, and J. F. Ayers.
Journal of Hydrology, Vol 45, No 1/2, p 21-37, January 1980. 8 Fig, 18 Ref, 1 Append.

Descriptors: *Recharge, *Groundwater recharge, *Islands, Natural recharge, Hydraulic conductivity, Evapotranspiration, Coasts, Aquifers, Tracers, Chlorides, On-site investigations, On-site data collections, Data processing, Mathematical models, Hydrogeology, *Bermuda.

In Bermuda, as in other coastal and oceanic-island environments, rainfall has a significant chloride concentration. As a result, there is a relatively straight-forward way of estimating groundwater recharge by considering the Cl(-) ion as a tracer which is concentrated by evapotranspiration. The Cl(-) concentration of rainfall in Bermuda is about 15 ppm. That of the freshest part of the largest Ghyben-Herzberg lens is about 60 ppm. Taking the 60 ppm value as an indicator of the Cl(-) concentration of recharge, the average recharge rate is estimated at 0.25 of the 147-cm/yr average rainfall, or about 37 cm/yr. This estimate is similar to two other estimates of recharge in Bermuda, each derived from hydrogeologic field data: (1) a 33-cm/yr estimate inferred from a 2000000-sq m area of diversion in which outflows (extractions) are 2870 cu m/day and the change in storage is estimated at 1100 cu m/day, from the rate of lowering of the water table; and (2) an estimate of 35 to 45 cm/yr resulting from combination of the ratio of recharge to hydraulic conductivity of the Paget Formation (0.000012), determined from the configuration of the Ghyben-Herzberg lenses, and the hydraulic conductivity of the Paget Formation (85-100 m/day), estimated from the behavior of the water table. The agreement between the three estimates of recharge indicated that the rather simple and inexpensive technique of calculating recharge from Cl(-) content of rainfall and fresh groundwater can be a useful addition to the arsenal of techniques by which recharge of small oceanic islands can be evaluated. The study of groundwater-table variations due to ocean-tide effects in a coastal aquifer may yield, under certain conditions, its hydrodynamical characteristics. Such a study was attempted about a zone of the limestone aquifer of the Miocene of Algarve (Portugal). Two computation methods can be utilized, depending on the form of the free-water table evolution: (1) a Carson-Laplace transform, or (2) adjustment of a sinusoidal variation law to the fluctuations. Their application permitted characterization of the aquifer's general hydrodynamical behavior. The model gives the most satisfying reconstitutions of the observations, particularly points out a seepage situation which fits quite well to the known geological conditions of the aquifer. GEOHYDROLOGIC MODEL OF THE FLORIDAN AQUIFER IN THE SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT,
Florida Univ., Gainesville. Dept. of Geology.
A. F. Randazzo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-151475, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Center, University of Florida, Publication No 46, 1980. 79 p, 22 Fig, 11 Tab, 72 Ref. OWRT B-032-FLA(3), 14-34-0001-7148.

Descriptors: *Aquifer characteristics, *Groundwater movement, *Porosity, *Permeability, *Ground-water resources, *Aquifer management, Limestones, Petrography, Water management, Aquifers, Facies, Diagenesis, Florida, Southwest Florida.

Nineteen carbonate rock cores from the Southwest Florida Water Management District and adjacent counties were analyzed by megascopic, microscop-

ic, X-ray diffraction, and atomic adsorption spectrometry techniques for the determination of lithofacies paleontology, mineralogy, and geochemistry. These wells penetrate biozones representative of the 'Tampa', Suwannee, Ocala, Avon Park, and Lake City Formations. Numerous depositional cycles were recognized by cyclic occurrences of rock types and depositional environments. Two processes of dolomitization are suggested: homogeneous dolomitization resulting in single-stage development of microtextured aphanotopic, peloidal and mosaic fabrics; and heterogeneous dolomitization resulting in multi-stage development of porphyrotopic and some mosaic fabrics. The pattern of crystallization fabric distribution appears to be related to sedimentologically defined depositional cycles. The type of visible porosity can be related to the type of crystallization fabric. Greatest total porosity is found in cavernous zones associated with formational contacts. Geochemical evidence supports a mixing zone model of diagenetic dolomitization for the Floridan Aquifer. Variations in sea level and fluctuations of the phreatic zone could cause the dolomitizing solutions to contact large volumes of rock through time, resulting in thick sequences of dolomite. (Heaney)

Descriptors: *Groundwater, *Hydrogeology, *Aquifer characteristics, *Geology, Water quality, Water resources, Groundwater movement, Transmissivity, Dissolved solids, New Mexico, Colorado, *San Juan Basin.

Principal aquifers in the San Juan Basin of New Mexico and Colorado are the Entrada Sandstone, Westwater Canyon Member of the Morrison Formation, Gallup Sandstone of the Mesaverde Group, several sandstones in the Mesaverde Group above the Gallup (Dalton Sandstone Member of the Crevasse Canyon Formation, Point Lookout Sandstone, Menefee Formation, Cliff House Sandstone), and sandstones of Tertiary age. Most ground water flows from topographically high outcrop areas toward the San Juan River and Rio Grande valley. Much of the water may move through confining layers to other aquifers or to the land surface rather than discharging directly to the streams. Transmissivities of the sandstones range from 50 to 300 square feet per day. Lowest dissolved-solids concentrations occur in or near outcrops of the sandstones and increase in the direction of groundwater flow. Concentrations range from less than 500 milligrams per liter to more than 30,000 milligrams per liter. (Kosco-USGS)

GROUND-WATER RESOURCES OF GRANT AND SIOUX COUNTIES, NORTH DAKOTA,
Geological Survey, Bismarck, ND. Water Resources Div.
P. G. Randich.
North Dakota County Ground-Water Studies 24--Part III, and North Dakota Geological Survey Bulletin 67--Part III, 1979. 49 p, 19 Fig, 5 Plates, 3 Tab, 52 Ref.

Descriptors: *Groundwater resources, *North Dakota, *Aquifer characteristics, *Water yield, *Water quality, Chemical properties, Potential water supply, Hydrogeology, Water wells, Water level fluctuations, Data collections, Maps, Hydrographs, Water utilization, *Grant County(N Dak), *Sioux County(N Dak).

Ground water in Grant and Sioux Counties is obtainable from aquifers of Late Cretaceous, Tertiary, Pleistocene, and Holocene age. The major bedrock aquifers in the counties are the Fox Hills and Hell Creek aquifers of Late Cretaceous age and the Cannonball and Ludlow, undifferentiated, and Tongue River aquifers of Tertiary age. Potential yields to individual wells range from about 5 to 150 gallons per minute. The water generally is soft and high in dissolved solids. Aquifers of Pleistocene age--the Shields, Elm Creek, St. James, Beaver Creek, and Battle Creek aquifers--underlie about 48 square miles in Grand and Sioux Counties. Well yields of as much as 1,000 gallons per minute are obtainable in a few places along the central axes of these aquifers. The major dissolved constituents in water from these aquifers are calcium, magnesium, sodium, bicarbonate, and sulfate. Aquifers of Holocene age are located in the alluvial deposits in the Cannonball River, Heart River, and Cedar Creek valleys. Potential well yields generally are less than 50 gallons per minute. DETERMINATION OF SELECTED HYDRAULIC PROPERTIES OF SUBARCTIC SOILS,
Alaska Univ., Fairbanks. Inst. of Water Resources.
D. L. Kane.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-150956, Price codes: A03 in paper copy, A01 in microfiche. Completion Report 78-22, January 1980. 27 p, 8 Fig, 2 Tab, 25 Ref, 2 Append. OWRT A-064-ALAS(3).

Descriptors: *Soil water movement, *Subartic, *Alaska, *Cold regions, Snowmelt, Ablation, Permeability, Hydraulic conductivity, Porosity, Permafrost, Soil physical properties, Ice, Subsurface drainage, Runoff, Groundwater recharge.

The critical hydraulic properties of partially frozen soils were studied to aid in the evaluation of potential groundwater recharge and in forecasting surface runoff. Specific areas examined were (1) the redistribution of moisture in near-surface soils during winter, (2) infiltration rates for partially frozen soils, (3) the role of soil moisture content in runoff generation, (4) the hydrologic significance of surface organic soils, and (5) the importance of permafrost terrain in surface runoff generation. It was found that for snowmelt infiltration, the movement of soil water to the ground surface in winter drastically alters infiltration rates by forming an ice-rich zone at the surface. The higher the soil moisture content the greater the blockage at the surface. In many northern areas organic soil layers up to 50+ cm cover the permafrost terrain. The infiltration capacity of this organic layer is much higher than that of the underlying, sometimes frozen, mineral soils of the permafrost. If this organic layer is heavily saturated as it is during certain seasons of the year, incoming precipitation is rapidly translated into downslope flow and stream flow. Study results were presented at the Canadian Hydrology Symposium: 79-Cold Climate Hydrology and at the American Geophysical Union-Cold Regions Soil Water Problems. Copies of two papers presented at the symposiums are included. (See W80-03649 and W80-03650) (Seigler-IPA)

HYDROLOGIC ROLE OF SHALLOW ORGANIC SOILS IN COLD CLIMATES,
Pacific Northwest Forest and Range Experiment Station, College, AK. Inst. of Northern Forestry.
C. W. Slaughter, and D. L. Kane.
In: Determination of Selected Hydraulic Properties of Subarctic Soils, January 1980. Reprint of paper presented at Canadian Hydrology Symposium: 79 Cold Climate Hydrology, National Research Council of Canada, May 10-11, 1979, Vancouver, British Columbia. 10 p, 3 Fig, 1 Tab, 16 Ref. OWRT A-064-ALAS(1).

Descriptors: *Alaska, *Organic soils, *Permafrost, *Subarctic, *Runoff cold regions, Hydrographs, Watersheds(Basins), Permeability, Porosity, Saturated flow, Soil physical properties, Soil water movement, Subsurface drainage, Ice.

The effect on runoff of relatively shallow organic soils (20 to 50+ cm) that cover mineral soils in subarctic areas such as the Yukon-Tanana Uplands of Alaska is examined. When the organic layer is underlain by impermeable permafrost, a typical condition, rainfall or snowmelt causes the organic layer to become saturated. Water then moves rapidly downslope through the organic layer contributing significantly to surface runoff and creating a shallow water retention area. When the organic layer is not underlain by permafrost more infiltration into the lower mineral soil is possible resulting in less runoff. Factors affecting the role of organic soils in runoff include thermal, hydraulic, and physical properties such as bulk density, pore pressures, hydraulic conductivity, moisture content, and ice content. Seasonal conditions also result in changes. In winter organic soils that were moist at the time of 'freeze up' contribute moisture to the covering winter snowpack by vertical transport. Estimates are at 25 to 30% of the water equivalent of the snowpack. This desiccates the organic layer in winter and at least some of the spring snowmelt is utilized to satisfy this moisture deficit in the organic layer. In summer the organic layer acts as a shallow aquifer of downslope water movement into streamflow. To verify these conditions streamflow from two subdrainage systems of the Caribou-Poker Creeks Research Watershed were examined. Basin C-2 has about 3.5% permafrost by area while basin C-3 has about 53% permafrost. Results show that the permafrost dominated basin C-3 'flashier' in flow with high peak flows and low base flows

when compared to the C-2 basin. (See also W80-03648) (Seigler-IPA)

SNOWMELT INFILTRATION INTO SEASONALLY FROZEN SOILS,
Alaska Univ., Fairbanks. Inst. of Water Resources.
D. L. Kane.
In: Determination of Selected Hydraulic Properties of Subarctic Soils, January 1980. Reprint of paper presented at Cold Regions Soil Water Problems, American Geophysical Union, September 19-20, 1979, Calgary, Alberta. 9 p, 5 Fig, 1 Tab, 9 Ref. OWRT A-064-ALAS(2).

Descriptors: *Permafrost, *Infiltration, *Alaska, *Soil moisture, *Soil water, *Frozen soils, Ice, Porosity, Soil water movement, Snowmelt, Ablation, Loam, Silts, Gravimetric analysis, Permeability, Winter, Hydraulic conductivity, Pores.

The transmission properties of frozen unsaturated silt loam near Fairbanks, Alaska, were examined. The relationship of infiltration rate to soil moisture content was also studied. Because the techniques used were those accepted for determining the properties of unfrozen, unsaturated flow, exact results were not obtained but possible ranges of values for a given condition were. Infiltration rates were measured by filling an augerhole (11.1 cm in diameter and 20 cm in depth) with 0C water. This was done for both frozen and unfrozen soils. Moisture content measurements were made at several field sites by taking a soil core and using gravimetric analysis. Varying temperatures and organic contents were considered. Infiltration tests were conducted and infiltration curves were developed for the various conditions. Results show that the redistribution of soil water towards the ground surface in winter can drastically alter infiltration rates for frozen soils. As water moves to the surface in winter it forms an ice-rich zone near the ground surface by blocking soil pores. The higher the moisture content of soils, the more ice present in the frozen soil portion. This ice layer reduces infiltration from snowmelt and also reduces saturated hydraulic conductivity. A HYSTERESIS MODEL BASED ON AN EXPLICIT DOMAIN-DEPENDENCE FUNCTION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Y. Mualem, and E. E. Miller.
Soil Science Society of America Journal, Vol 43, No 6, p 1067-1073, November-December 1979. 6 Fig, 11 Ref. NSF ENG 7800845.

Descriptors: *Hysteresis, *Mathematical models, *Pore water, *Pore pressure, Capillary water, Equations, Drying, Curves, Computer programs, Moisture content, Theoretical analysis, Laboratory tests, Domain water, Pore-water distribution function, Air-entry blockage.

A quantitative model of hysteresis is proposed, assuming the pore-water blockage against air entry to be a direct function of the volume of pore domains located in the completely filled region of the state diagram. The relative volume of the pore-water domains theta sub o, evaluated from the history of the capillary head psi assuming the domains are independent, is employed in a dependency correction function P* sub d (theta sub o). For calibration, this model requires only the main loop of hysteresis and one drying scanning curve. The merit of this 'Model III sub expl' compared with Model III is that any hysteretic process of wetting and drying is expressed analytically in explicit form. This property simplifies the computational procedure and saves computer time in practical application. The overall agreement between predicted and measured hysteretic behavior is acceptable. However, the study reveals that in the range of the air entry value the model does not reproduce the main drying curve accurately if it diverges considerably from the drying scanning curve. This deficiency may reflect the less physical ground for Model III sub expl compared to the implicit Model III. (Visocky-ISWS)

MEASURED AND APPROXIMATE FLUX-CONCENTRATION RELATIONS FOR ABSORPTION OF WATER BY SOIL,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Environmental Mechanics.
I. White.
Soil Science Society of America Journal, Vol 43, No 6, p 1074-1080, November-December 1979. 8 Fig, 9 Ref.

Descriptors: *Soil water, *Absorption, *Soil moisture, *Model studies, Mathematical models, Soil water movement, Steady flow, Infiltration, Soils, Irrigation, Soil properties, Soil science, Flux-concentration relations, Constant concentration, Constant flux.

The flux-concentration relation of Philip (1973) was calculated using moisture profiles measured during absorption of water by a fine sand when water was supplied at both constant hydraulic potential and constant rate. The general behavior of the measured flux-concentration relations was found to be consistent with those of the model soils calculated by Philip. Within the accuracy of the measurements, no significant time-dependence of the relation was found for the constant flux boundary condition over a large time span. Measurements of the time-averaged flux-concentration relation, however, suggest some significant time-dependence for short times. Simple approximations for the flux-concentration relation, based on these observations, were suggested. These approximations enable easily evaluated predictions to be made of the salient features of constant rate application of water to soil, which are sufficiently accurate for most practical purposes. INFILTRATION OF SOILS AS AFFECTED BY THE PRESSURE AND WATER CONTENT AT THE TIME OF COMPACTION,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
M. Akram, and W. D. Kemper.
Soil Science Society of America Journal, Vol 43, No 6, p 1080-1086, November-December 1979. 20 Fig, 1 Tab, 7 Ref. AID/ta-C-1411.

Descriptors: *Infiltration, *Soil compaction, *Compacted soils, *Laboratory tests, Pressure, Moisture content, Cohesive soils, Soil types, Soils, Soil water, Bulk density, Freezing, Thawing, Wetting, Drying, Soil science, Volume reduction, Soil piping.

Infiltration rates, volume reduction, and bulk densities of soils were determined on soils as a function of compacting pressures and water content at the time of compaction. Maximum compaction generally occurred when the soils were packed at water contents near field capacity. When compacting loads were less than 1 kg/sq cm, the minimum bulk densities occurred when soils had water contents of about one-half field capacity, indicating that surface tension of water films in the soils plays a major role in cohesiveness and stabilization against compaction under these conditions. Compacting loads of 3.46 kg/sq cm, at field capacity on sandy loams and finer textured soils, reduced infiltration rates to less than 0.1% of values obtained after these soils had been compacted when they were air dry. In a loamy sand soil this reduction was to about 1%. The low infiltration rates following compaction were increased by wetting and drying, although several cycles of wetting and drying did not raise the infiltration rate to the level observed before packing. Freezing and thawing cycles also increased the infiltration rates of previously compacted soils. Most of the change took place in the first freezing and thawing cycle. The large changes in infiltration rates using achievable levels of compaction at the 'optimum' water contents indicate that compaction can play a major role in the management of water in ditches, reservoirs, furrows, and watersheds. RECLAMATION OF SALINE-SODIC SOILS BY LEACHING,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
W. A. Jury, W. M. Jarrell, and D. Devitt.
Soil Science Society of America Journal, Vol 43, No 6, p 1100-1106, November-December 1979. 8 Fig, 3 Tab, 16 Ref.

Descriptors: *Leaching, *Saline soils, *Alkaline soils, On-site investigations, Lysimeters, Cation exchange, Solutes, Land reclamation, Salts, Sodium, Chlorides, Magnesium, Irrigation, Soil chemistry, Soil chemical properties, Soil water, Soil types, Soil science.

Seven lysimeters containing sandy loam or clay loam soils were reclaimed by ponded or unsaturated leaching following a saline irrigation experiment of 2.5 years duration. Initial soil electrical conductivity was as high as 25 mmho/cm with associated exchangeable sodium percentages up to 60%. Substantial quantities of solid gypsum and lime were present in the soil profile from precipitation reactions during the crop irrigation stage. Drainage volumes were expressed in pore volume units to scale out differences between water retention and leaching rates. Plots of scaled chloride concentrations vs. pore volumes were similar for all lysimeters, with essentially all chloride removed by 1.5 pore volumes. Total salt removal was well described by a single curve for all treatments. Standard cation exchange equilibrium equations were used in a chromatographic displacement model to produce an algebraic equation to describe exchangeable Na reductions as a function of leaching pore volumes. This model, along with a model for calculating exchangeable Mg reductions, was in good agreement with measured changes for all treatments. No special amendments were required to maintain high permeability during leaching, even when distilled water was used, because of redissolution of previously precipitated Ca salts. (Sims-ISWS)

EFFECT OF TILLAGE ON SOIL-WATER MOVEMENT DURING CORN GROWTH,
Auburn Univ., Alabama. Dept. of Agronomy and Soils.
A. B. Weatherly, and J. H. Dane.
Soil Science Society of America Journal, Vol 43, No 6, p 1222-1225, November-December 1979. 2 Fig, 2 Tab, 19 Ref.

Descriptors: *Soil water movement, *Cultivation, *Crops, *Corn(Field), *Alabama, On-site investigations, Soils, Soil types, Soil properties, Hardpan, Soil water, Soil moisture, Droughts, Bulk density, Root zone, Crop response, Crop production, Agriculture, Farm management.

The occurrence of drought during the growing season often limits the amount of soil water available for plant growth. The availability of soil water can further be limited if a hard layer exists not too far below the soil surface. Field experiments were therefore conducted on a Cahaba sandy loam soil (Typic Hapludult) to determine the effect of tillage practices on soil water movement during corn growth. Four tillage practices, namely, conventional-tillage-without-subsoiling, conventional-tillage-with subsoiling, no-tillage-without-subsoiling, and no-tillage-with-subsoiling, were studied on a soil with a plow plan. Soil water contents and soil water pressure heads were measured with a neutron probe and tensiometers, respectively. Water extraction by roots was determined by application of the integral form of the general transport equation for soil water. Soil water movement and water uptake were less for the conventional-tillage-without-subsoiling treatment than for the other treatments. The two subsoiled treatments and the no-tillage-without-subsoiling treatment indicated root penetration and soil-water uptake below 50 cm. When soil water uptake patterns were compared with corn yield on a weight-per-ear basis, there was a direct, positive correlation between the amount of water taken up by the corn plants and corn yield. (Sims-ISWS)
W80-03724

INFLUENCE OF A COMPACT ZONE ON SOLUTE TRANSPORT DURING INFILTRATION OF WATER,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Soils.
G. S. Hira, and N. T. Singh.
Soil Science Society of America Journal, Vol 43, No 6, p 1251-1252, November-December 1979. 3 Fig, 7 Ref.

Descriptors: *Infiltration, *Compacted soils, *Solutes, *Soil water movement, Soil water, Soils, Chlorides, Salts, Ions, Root zone, Bulk density, Soil physical properties, Soil science, Agriculture, Compact zone, Compacted layers.

In most soils, continuous plowing results in the formation of a compact zone below the plowing depth. Laboratory studies were conducted to examine the effect of such a zone on the displacement of chloride (Cl-) during infiltration of water. A compact zone of 4- or 8-cm thickness of 1.62 g/cu cm or 1.80 g/cu cm bulk density was created at a depth of 8 cm in soil columns. A surface-applied slug of calcium chloride was leached with 4 or 6 cm of distilled water. The presence of a compact zone in the soil profile pushed the Cl- peak deeper, dispersed the ions in a narrower region, and increased the peak Cl- concentration. Increasing bulk density and thickness of a compact zone increased the depth of the peak Cl- concentration. (Sims-ISWS)

FORMULATING LAKE MODELS WHICH PRESERVE SPECTRAL STATISTICS,
Ohio State Univ., Columbus. Dept. of Civil Engineering.
C. Babajimopoulos, and K. W. Bedford.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15137, p 1-19, January 1980. 5 Fig, 30 Ref, 2 Append. OWRT B-063-OHIO(4).

Descriptors: *Hydrodynamics, *Lakes, *Mathematical models, Model studies, Numerical analysis, Turbulence, Turbulent flow, Hydrology, Equations, Statistical methods, Analytical techniques, Velocity, Distribution patterns, Water circulation, *Pollution controls, Signal processing, Digital filter.

The ability of numerical lake models to predict verifiable results is very poor. Difficulties with the popular point-by-point verification method are intractable when confronted with these turbulent flows which have only reproducible statistics. A lake transport model was formulated which permits the calculation of not only mean field quantities but the known spectral details of turbulent flow. Higher order spatial averaging of the non-Linear terms by a low pass filter results in a sequence of third order differential terms. Additionally, the correlated terms resulting from the filtration are closed with the Smagorinsky subgrid scale viscosity representation. Finite difference representations were used with second order accurate schemes on the third order corrective differential terms and fourth order on all others. Mean flow field computations were verified by intercomparison with existing rigid lid circulation models. Differences between computations were negligible with only small increases in time and storage. (Lee-ISWS)

FISH MORTALITY AND FISHING DURING AN UNPRECEDENTED DRAUGHT IN LAKE PICHHOLA, UDAIPUR,
Udaipur Univ. (India). Dept. of Zoology.
V. S. Durve, and V. K. Rajbanshi.
India Journal of Fisheries, Vol 22, p 297-299, 1975. 2 Fig, 1 Ref.

Descriptors: *Fishkills, *Lakes, *Droughts, *Dissolved oxygen, Water shortage, Moisture deficit, Climatology, Dry seasons, Commercial fish, Lake morphology, Lake stages, Water temperature, *India.

A heavy mortality of fish occurred in Lake Pichhola in Udaipur, in May 1973, due to an unprecedented draught. While most of the smaller-sized fishes were dead, the larger ones were fished out and marketed before the lake totally dried up. The method of fishing adopted is briefly described. Oxygen content was reduced to 2.3 ppn and water temperature was 35.9C. Fish were surfacing for oxygen & mortalities insued. (Deal-EIS)

Applied and Environmental Microbiology, Vol 37, No 2, p 213-221, February, 1979. 5 Fig, 3 Tab, 27 Ref. NSF DEB 7824071 and DEB 73-01511-A01.

Descriptors: *Methane bacteria, *Metabolism, *Anaerobic conditions, *Microbial degradation, *Knaack Lake(WI), Water temperature, Anaerobic bacteria, Sediments, Microorganisms, Microbiology, Sediment-water interfaces, Carbon dioxide, Respiration, Depth, Meromixis, Nitrates, Sulfates, Water, Methane, Sulfides.

Methanogenesis in Knaack Lake, central Wisconsin, is highest in surface sediments (7.6 nmol CH4/10 ml h) at 22 m, considerably lower in deeper sediments (1.2 nmol CH4/10 ml h) and lowest in the water column (0.6 nmol CH4/10 ml h) at 21.5 m according to maximum rates calculated from 14-HCO3 reduction by endogenous electron donors. However, large dissolved methane concentrations (4,000 micro mol/l) occur in bottom waters and a maximum occurs 4 m above the sediment. Methane produced in the water column is of biological origin as no 14-CH4 is produced from 14C-labeled substrates in control experiments that contain formaldehyde. Temperature optimum for both methanogenesis from acetate and acetate respiration is 37C, characteristic of biological activity in nonthermophilic environments. Further experiments with 5 micro g sulfide/ml additions show methanogenesis stimulation from acetate, whereas the addition of higher concentrations inhibits methanogenesis. Acetate respiration is inhibited by 1.0 micro g sulfide/ml additions. Sulfate addition does not significantly inhibit methane production from acetate or increase acetate respiration from CO2. Nitrate addition, however, completely inhibits methanogenesis and slightly stimulates total 14-CO2 production. Knaack Lake is a small (1.1 ha) meromictic Lake with 22 m maximum depth. The lake is anaerobic below the thermocline (3 m) in the summer, mixes to 12-14 m during the fall, and is completely anaerobic under the ice in winter. (Danovich-Wisconsin)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY1, Proceedings Paper 15138, p 21-38, January 1980. 10 Fig, 2 Tab, 35 Ref. OWRT B-063-OHIO(5).

Descriptors: *Dispersion, *Hydrodynamics, *Lakes, *Mathematical models, Model studies, Turbulence, Energy, Winds, On-site investigations, Numerical analysis, Calibrations, Circulation, Limnology, Spectra, Energy spectra, Variance analysis, Verifying.

A sequence of numerical experiments was performed to determine the suitability of coarse grid lake turbulence models developed in the paper in preserving theoretically known variance spectra. A complete review of theoretically known variance spectra was presented, and all relevant spectral data from aquatic field experiments were summarized. Three basins were used and set into motion by a spectrally correct Markov model wind shear. Wave number spectra were calculated by Taylor's hypothesis from time series collected at the basin center. Based on these numerical experiments, it was concluded that low pass filter preparation is a necessity for coarse grid spectra preservation. Traditional model formulations will not reproduce the known spectra. Experiments revealed that the hydrostatic pressure assumption and rigid lid pressure formulation only permit a two-dimensional turbulence structure which is, of course, not observed in field data except during fluid acceleration. (Sims-ISWS)

ATTENUATION OF LIGHT AND DAILY INTEGRAL RATES OF PHOTOSYNTHESIS ATTAINED BY PLANKTONIC ALGAE,
Minnesota Univ., Minneapolis. Dept. of Ecology and Behavioral Biology.
R. O. Megard, W. S. Combs, Jr., P. D. Smith, and A. S. Knoll.
Limnology and Oceanography, Vol 24, No 6, p 1038-1050, November 1979. 9 Fig, 3 Tab, 31 Ref. OWRT A-026-MINN(4).

Descriptors: *Photosynthesis, *Light, *Algae, *Plankton, Chlorophyll, Model studies, Mathematical models, Radiation, Irradiation, Equations, Theoretical analysis, Sampling, On-site investigations, Lakes, Organic matter, Attenuation, Limnology.

The daily integral rate of photosynthesis attained by planktonic algae in Lake Minnetonka, Minnesota, conforms to an equation for a rectangular hyperbola proposed by Bannister. The rate depends on the concentration of chlorophyll a in the mixed layer and also upon 2 kinetic parameters that are analogous to the kinetic constants in equations for reactions catalyzed by enzymes. One parameter is an upper limit, psi, that would be attained by very dense populations, and the other is a concentration of chlorophyll, c', at which attenuation of photosynthetically active radiation (PhAR) by the algae equals background attenuation by the water. The parameters were evaluated with the same statistical procedures used to evaluate the kinetic constants for enzyme reactions. The limit, psi, for the daily integral rate in this lake would be about 0.5 mol

02/m sq/d. Observed daily rates are usually less than 0.7 psi, because chlorophyll in the water usually intercepts less than 70% of the radiant energy. Coefficients for the attenuation of PhAR by chlorophyll, epsilon sub c, and by the water, epsilon sub w, were estimated from the linear regression of the total attenuation coefficient, epsilon, on chlorophyll concentration. The estimate of epsilon sub c is 0.022 + or - 0.005/m/mg Chl/m cu. Background attenuation, epsilon sub w, affects integral photosynthesis in the same way as a competitive inhibitor affects enzyme reactions: it is a constituent of c' = epsilon sub w/epsilon sub c which, together with chlorophyll concentration, determines the fraction of underwater PhAR intercepted by planktonic algae. PHOTOSYNTHETICALLY ACTIVE RADIATION IN A STAND OF PHRAGMITES COMMUNIS TRIN. II. MODEL OF LIGHT EXTINCTION IN THE STAND,
Ceskoslovenska Akademie Ved, Trebon. Dept. of Hydrobotany.
J. P. Ondok.
Photosynthetica, Vol 7, No 1, p 50-57, 1973. 6 Fig, 2 Tab, 7 Ref.

Descriptors: *Marsh plants, *Energy conversion, *Model studies, Wetlands, Photosynthesis, Light intensity, Plant physiology, Primary productivity, Leaves, Structure.

A model of extinction of photosynthetically active radiation in a Phragmites stand is constructed on the basis of relative volume of shading (Vr) defined by the size of the plant aerial organs, their spatial distribution and by sun position. The suggested extinction law: R sub i = e to the (- sub i Vr) power (i = 1,2) is verified by experimental data and compared with other empirical formulae. Subscripts i specify the equation for extinction of both diffuse and direct radiation. (Steiner-Mass)

DIATOM FLORISTICS AND SUCCESSION IN A PEAT BOG NEAR LILY LAKE, SUMMIT COUNTY, UTAH,
Brigham Young Univ., Provo, UT. Dept. of Botany and Range Science.
S. A. Jatkar, S. R. Rushforth, and J. D. Brotherson.
Great Basin Naturalist, Vol 39, No 1, p 15-43, March, 1979. 8 Fig, 5 Tab, 43 Ref.

Descriptors: *Lake stages, *History, *Bogs, *Utah, Wetlands, Peat, Palynology, Succession, Lakes, Diatoms.

Diatoms from core samples obtained from the edge of Lily Lake, Summit County, Utah, were studied. Populations from each 15 cm of the core and niche metrics of the important species were analyzed. This study demonstrates four periods of history in the lake as mirrored by the diatom populations. The first period was mesotrophic and alkaline. This graded into an acidic, cystrophic period which in turn yielded again to a mesotrophic alkaline period. The most recent period can be characterized by a return to dystrophy. (Steiner-Mass)

2I. Water In Plants

HARPER SEEKS CLIMATE CONTROL WITH SPRINKLED VEGETABLES,
Arizona Farmer-Ranchman, p 12-15, August 1979. OWRT A-101-ARIZ(1), 14-34-0001-0103.

Descriptors: *Sprinkler irrigation, *Temperature control, *Soil temperature, *Vegetable crops, Irrigation efficiency, Arid climates, Arizona, Soil-water-plant relationships, Crop response, Evaporative cooling, Intermittent sprinkling, Water application.

Fred Harper and Dr. Arthur Pratt have been working on a 16-acre test with evaporative cooling via solid set sprinklers, west of Litchfield Park, Arizona, trying to get eight different vegetables to think they aren't being grown in Arizona summers where temperatures have been hitting 116 degrees. Harper and Pratt's work is designed to determine the effect of soil, filiage and fruit cooling through the use of sprinkler irrigation. They're also interested in determining whether water quality in terms of salt level has any adverse effect on plant growth and development when applied during high temperature periods. They want to know the effect of high humidity on pests and diseases; its effect on weeds; whether or not cooling growing conditions means better quality or eye appeal; and if cooling will allow growers to either extend their growing seasons further into the spring or plant earlier in the fall.

PHYTOMECHANICS--PLANT PHYSIOLOGY AND APPLIED MECHANICS,
Iowa State Univ., Ames.
D. B. Johnson, and C. P. Burger.
In: 'Developments in Theoretical and Applied Mechanics', Proceedings of 9th South Eastern Conference on Theoretical and Applied Mechanics, Vanderbilt Univ. Nashville, Tennessee, May 1978. Vol 9, p 553-562. OWRT B-062-IA (6), 14-34-0001-8086.

Descriptors: *Plant growth, *Plant physiology, *Growth rates, Soil-water-plant-relationships, Strain gage dendrograph, Dendromenter, Stress, Fatigue(Mechanics), Xylem, Water storage.

In plant physiology, the need for a simple, inexpensive, nondestructive method for continuously and accurately recording changes in stem diameters of woody plants has been recognized for nearly 100 years. A dendrograph which utilizes strain gages mounted directly on plant material appears to answer this need. Samples of data obtained with a strain gage dendrograph reveal that it is capable of recording complex dynamic changes in stem strain with an unprecedented degree of sensitivity.

CHEMICAL FLUCTUATIONS DUE TO SEASONAL AND CROPPING EFFECTS ON AN ALGAL-SEAGRASS COMMUNITY,
University of South Florida, Tampa. Dept. of Biology.
C. J. Dawes, K. Bird, M. Durako, R. Goddard, and W. Hoffman.
Aquatic Botany, Vol 6, No 1, p 79-86, January, 1979. 1 Fig, 3 Tab, 15 Ref.

Descriptors: *Benthic flora, *Tarpon Springs(FL), *Energy, *Plant growth, *Marine plants, Algae, Biomass, Energy conversion, Plant tissues, Plant physiology, Proteins, Marine algae, Primary productivity, Seasonal, Carbohydrates, Cutting management, Biochemistry, Growth rates.

Although total carbohydrate and protein levels vary between Thalassia and algal components in a seagrass bed off Tarpon Springs, Florida, 1977, final energy levels are roughly equal (4.2-4.3 kcal/g organic wt) for both components collected from plots before and after cropping or clearing. The seagrass bed is located 200 m offshore in one m of water at Sunset Park, Tarpon Springs on Florida's west coast. Highest protein levels occur in spring and range 3.2-10.6% for Thalassia (turtle grass) and 1.8-4.0% for algae. Protein levels are highest in regrowth collections from both totally cleared and cropped plots, suggesting protein synthesis during growth. Ash levels are 30-40% in turtle grass while algal ash levels are 60-70%. Ash levels are generally lower in turtle grass regrowth collections while algal regrowth has higher ash levels. No seasonal changes in ash content are evident for either component. Soluble carbohydrate levels are 3-12% for turtle grass and 6-10% for algae with highest levels in late spring and fall. Regrowth is very rapid in spring months and carbohydrate reserves can be replenished in four weeks. Results demonstrate that the algal component is energentically equal in importance to Thalassia. THE NUTRITIONAL ECOLOGY OF CYPERUS ESCULENTUS, AN EMERGENT AQUATIC PLANT, GROWN ON DIFFERENT SEDIMENTS,
Army Engineer Waterways Experimental Station, Vicksburg, MS. Environmental Lab.
J. W. Barko, and R. M. Smart.
Aquatic Botany, Vol 6, No 1, p 13-28, January, 1979. 5 Fig, 7 Tab, 33 Ref.

Descriptors: *Emergent plants, *Sediments, *Laboratory tests, *Nutrients, *Growth rates, Aquatic plants, Cultures, Nitrogen, Phosphorus, Limiting factors, Biomass, Organic matter, Nutrient requirements, Plant growth, Plant tissues, Soil chemistry, Sands, Bottom sediments, Rooted aquatic plants.

Nitrogen is growth-limiting for Cyperus esculentus, an emergent plant, grown in a greenhouse investigation with sediments obtained from Detroit River, Indiana Harbor, Michigan City Harbor, and Milwaukee Harbor. In sand cultures, Cyperus is similarly affected by selective removal of either nitrogen (N) or phosphorus (P). Shoot and tuber biomass directly correlate to both N and P supply. Critical concentration of N is 5.7 g/kg dwt and P is 0.95 g/kg dwt for Cyperus total biomass. Critical concentrations for shoots, tubers, and roots are 5.9, 5.2, 6.9 g/kg dwt, for N, respectively, and 0.79, 0.96, and 1.00 g/kg for P, respectively. Ratios of N:P are 7.5, 5.4, 6.9, and 6.0 for shoots, tubers, roots and total biomass, respectively. Sediments are predominatly fine textured but vary considerably in organic matter, P and N contents. Cyperus biomass ranges after three months growth on different sediments are substantial (0.6-18 kg/sq m). In general, shoot and tuber biomass are comparable at each site, and each exceeds root biomass. In

Cyperus both N and P are more concentrated in roots than in shoots and tubers. Tissue concentrations of N are less and P greater than the critical concentrations of these nutrients, suggesting that Cyperus growth is limited by N on most sediments used. Ratios of tissue N:P, when compated with sand culture values, substantiate N as the growth-limiting element. Ratios of belowground to aboveground biomass correlates negatively with plant growth. EXPERIMENTAL ECOLOGY WITH PARTICULAR REFERENCE TO PROPOSED COMMERCIAL HARVESTING OF DURVILLAEA (PHAEOPHYTA, DURVILLEALES) IN NEW ZEALAND,
Canterbury Univ., Christchurch (New Zealand). Dept. of Zoology.
C. H. Hay, and G. R. South.
Botanica Marina, Vol 22, No 7, p 431-436, October 1979. 5 Fig, 2 Tabb, 5 Ref.

Descriptors: *Plant growth, *Harvesting, *Colonization, *Phaeophyta, Ecology, Growth rates, Density, Littoral, Reproduction, Seasonal, Timing, Algae, Size, Weight, Methodology, Harvesting of algae, Biomass, Productivity, New Zealand, Durvillaea antarctica, Durvillaea willana.

Harvesting experiments on Durvillaea antarctica and D. willana, massive brown algae of lower littoral and upper sub-littoral rocky New Zealand coasts, respectively, show that year-round harvesting depletes standing stocks of both plants since harvesting time is critical in determining whether recolonization occurs the following season. Main study areas Tautuku and Kaikoura, localities 600 km apart on South Island east coast, were harvested 1972-1974. D. antarctica recolonization corresponds with the period of gamete release. Areas cleared April-June are recolonized by dense settlements: 7,000/sq m on Kaikoura and 1,400/sq m on Tautuku. Areas cleared after ganete release periods are poorly recolonized the following season (10/sq m) due to space competition with associated flora and invasion by other species. Although individual plant growth rates are highly variable, recolonizing D. antarctica stands are more uniform and compact than natural stands. Standing crops in experimental areas may be greater than in adjacent unmodified areas after 18 months. Harvesting methods are also important; removing holdfasts after harvesting causes dense recolonization and fast growth. Culling (removing only large fronds) increases small plant growth in the understory, but almost all those attached to composite holdfasts are later lost when holdfasts decay. Total reharvest of an area (Kaikours) culled 15 months previously is 32% of initial harvest. Whereas, 18 months regrowth on areas with removed holdfasts (Tautuku) weighs 1.5 times original wet weight. (Danovich-Wisconsin)

A NUTRITIONAL ANALYSIS OF A SUBLITTORAL DIATOM ASSEMBLAGE EPIPHYTIC ON ENTEROMORPHA FROM A LONG ISLAND SALT MARSH,
City Univ. of New York. Dept. of Biology.
J. J. Lee, M. E. McEnery, E. M. Kennedy, and H. Rubin.
Journal of Phycology, Vol 11, p 14-49, 1975. 97 Fig, 8 Tab, 80 Ref.

Descriptors: *Nutrient requirements, *Epiphytology, *New York, *Salt marshes, Wetlands, Biological communities, Marshes, Marine microorganisms, Marsh plants, Marine bacteria, Diatoms.

The diatom population structure of a salt marsh epiphytic community growing on Enteromorpha intestinalis was studied. A total of 218 species or varieties were recognized. The distribution of many species in the community was seasonal. Changes in the population structure of the community were reflected by changes in the nutritional patterns as judged by differences in the growth of diatoms and bacteria on different media. Almost half of the colony types grew on either unenriched seawater or basal synthetic seawater. Nitrite inhibited algal growth. Soil extract or acetone extract of Enteromorpha tripled growth; a complex vitamin extract mixture, glycerol, mannitol, or an autoclaved extract of Enteromorpha doubled colony numbers. The greatest number of diatom types and total colonies were recovered on media enriched with acetone extract of Enteromorpha, suggesting a possible nutritional relationship between Enteromorpha and its epiphytes. The algal assemblage growing epiphytically on Enteromorpha has a diverse auxotrophic profile which contributes to the productivity and stability within this important component of the epiphytic community and that much of the organic substrates used by individual species originate within and are recycled among the community members. EARLY GROWTH OF PICEA SITCHENSIS (BONG.) CARR ON DEEP OLIGOTROPHIC PEAT IN NORTHERN IRELAND,
Ministry of Agriculture, Belfast (Northern Ireland).
D. A. Dickson, and P. S. Savill.
Forestry, Vol 47, No 1, p 57-88, 1974. 9 Fig, 25 Tab, 18 Ref.

Descriptors: *Peat, *Plant growth, *Nitrogen, *Trees, Wetlands, Bogs, Minerals, Potassium, Phosphorus, Softwood, Deficient elements, Fertilizers, Herbicides, Forest management.

Relationships were examined between growth of young Sitka spruce, planted on deep oligotrophic blanket peat, and uptake of N, P, and K by the trees under various fertilizer and herbicide regimes. Despite the provision of adequate P, tree growth eventually becomes limited by a shortage of available N. This can be overcome at present only by repeated applications of fertilizer N. The use of herbicides to kill heather in checked crops increases the availability of N temporarily, and fertilizer K in all situations improves growth, though often only slightly. It is suggested that following the initial application of phosphate a finite fraction of the total N content of the peat becomes available to the trees. Once this has been used the release of mineral nitrogen is so slow that crops become N-deficient and growth is limited. (Steiner-Mass)

COMPARATIVE BIOMASS AND GROWTH OF CYPRESS IN FLORIDA WETLANDS,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
W. J. Mitsch, and K. C. Ewel.
American Midland Naturalist, Vol 101, No 2, p 417-426, 1979. 2 Fig, 4 Tab, 21 Ref.

Descriptors: *Florida, *Swamps, *Plant growth, Wetlands, Biomass, Water pollution effects, Water levels, Environmental effects.

Lowest biomass and tree growth rates were found in cypress-pine associations indicative of low water, in monospecific stands of cypress that are indicative of high water levels, and in a poorly drained cypress dome. Increases in individual tree growth ranged from 1.0 to 3.5 kg/year in these groupings. Highest cypress tree growth rates were found in cypress-tupelo systems and cypress-hardwood systems. The latter are less dominated by cypress, however, so individual tree growth is greater. Cypress-hardwood associations are known to be generally better drained than cypress-tupelo systems. Two experimental cypress domes currently receiving treated sewage effluent and groundwater showed high individual tree growth (5.0 and 4.2 kg/year, respectively), but little difference was noted between the two domes. Tree diameter increase showed normal cypress tree growth to be 1.0-2.0 mm/year with higher values of 2.8-3.3 in cypress-hardwood associations and the experimental cypress dome. Cypress in the poorly-drained dome increased by only 2.0 mm/year. (Steiner-Mass)

A LOWLAND VEGETATION SEQUENCE IN SOUTH WESTLAND: PAKIHI BOG TO MIXED BEECH-PODOCARP FOREST. PART 1: THE PRINCIPAL STRATA,
Otago Univ., Dunedin (New Zealand). Dept. of Botany.
A. F. Mark, and P. M. F. Smith.
Proceedings of the New Zealand Ecological Society, Vol 22, p 76-92, 1975. 11 Fig, 2 Tab, 21 Ref.

Descriptors: *Bogs, *Forest, *Distribution patterns, Wetlands, Peat, Palynology, History, Vegetation, Biomass.

Six stands of lowland vegetation representing transitions from pakihi bog to mixed beech-podocarp forest are described quantitatively from the coastal plain of the Arawata and Jackson Rivers in South Westland. The sequence depicts progressive changes in canopy height, biomass and floristic richness, and appears to involve, at least in part, a primary succession. Some boundaries have been sharpened by periodic fires but the long-term trend remains unobscured. Pollen evidence indicates that the pakihi bog began as a lake when the surrounding area was forested by both podocarps and silver beech. The bog seems never to have supported a woody vegetation but in the absence of fire, forest would slowly encroach on it. With a highway traversing the sequence, its reservation for educational and scientific purposes has been proposed. (Steiner-Mass)

DISTRIBUTION OF MACROFAUNA ON A MALAYAN MANGROVE SHORE,
Malaya Univ., Kuala Lumpar (Malaysia). School of Biological Sciences.
A. Sasekumar.
Journal of Animal Ecology, Vol 43, No 1, p 51-69, February, 1974. 7 Fig, 5 Tab, 17 Ref.

Descriptors: *Mangrove swamps, *Distribution patterns, *Aquatic animals, Wetlands, Mollusks, Tidal effects, Swamps, Spatial distribution, Gastropods, Crabs, Environmental effects.

Environmental parameters and distribution of macrofauna in a Malayan mangrove shore were studied. The environment is characterized by plant cover, fine sediments with high water-contents, rich organic deposits and variable, often low salinity. Most of the mangrove shore is in the high tide range and is exposed to the air for over 90% of the time. The fauna consists predominantly of decapod crustaceans and gastropods with polychaetes in less variety but in significant numbers. The intertidal vertical range of a species is largely determined by tidal exposure time. Plankton feeders such as barnacles and oysters grow abundantly on the lower stems of trees (below high water of neap tides) on sea-facing edges where there is presumably a steady supply of plankton food. Other animals, including several species of polychaetes and grapsid crabs, occur in areas with over 90% exposure time. Considering the crabs, ten species of grapsids and five of ocypodids have successfully colonized the high shore, while ten species of ocypodids and three grapsids have remained at lower levels in streams and on the pioneer mangrove shore. Most gastropods occur in areas with over 90% exposure time. (Steiner-Mass)

THE ECOLOGY OF A SALTMARSH IN SRI LANKA,
Sri Lanka Univ., Peradeniya. Dept. of Botany.
M. A. Pemadasa, S. Balasubramaniam, H. G. Wijewansa, and L. Amarasinghe.
Journal of Ecology, Vol 67, No 1, p 41-63, 1979. 10 Fig, 1 Tab, 31 Ref.

Descriptors: *Salt marshes, *Ecology, *Ecological distribution, Wetlands, Marshes, Marsh plants, Distribution patterns, Environmental effects, Zoning, Topography, Tidal effects.

The ecology of a saltmarsh system on a small islet on the north-west coast of Sri Lanka was investigated, using association-analysis and reciprocal averaging to order the floristic and edaphic data. Six chief plant communities--thorn scrub, dry saltmarsh pasture, an Arthrocnemum consociation, Suaeda communities, damp saltmarsh pasture and depressions--were tentatively recognized, and their ecological and floristic distinctiveness and interrelationships were further elucidated by the multivariate analyses. The distribution within the saltmarsh system of some selected edaphic factors such as moisture regime, water-retaining capacity, textural properties, organic-matter content, pH, and calcium, carbonate and chloride concentrations was established. The zonation of the saltmarsh vegetation is discussed in relation to the individual and integrated effects of several ecological factors, of which topography, textural variations of the soil, and exposure to floods, tides and winds, appear to be of particular importance. PHYTOSOCIOLOGICAL STUDIES OF URYU-NUMA MIRE STUDIES OF UPLAND BOG VEGETATION IN HOKKAIDO (II), (IN JAPANESE),
Hokkaido Univ., Sapporo (Japan). Lab. of Plant Ecology and Taxonomy.
K. Ito, and A. Umezawa.
Japanese Journal of Ecology, Vol 23, No 1, p 1-22, February, 1973. 2 Fig, 12 Tab, 25 Ref. (English summary).

Descriptors: *Bogs, *Marsh plants, *Japan, Wetlands, Fens, Distribution patterns, Systematics, Classification.

A marsh plant community classification was made of the Uryu-Numa mires, Japan. In the classification, sociations are first distinguished by the dominant or constant species, or by a combination of them, with the habitat indicators. The sociations distinguished are then grouped into associations by the characteristic species or sometimes by their combination with the plants which are usually conspicuous physiognomically. Five associations were recognized: (1) Hydrophytic community (5 sociations), (2) Hygrophytic community (4 sociations), (3) Fen vegetation (4 sociations), (4) Moss vegetation (12 sociations), and (5) Substitute community (2 sociations). (Steiner-Mass)
W80-03874

OPTIMAL NICHE SPACE OF THE RED-WINGED BLACKBIRD (AGELAIUS PHOENICEUS), I. NESTING SUCCESS IN MARSH AND UPLAND HABITAT,
Queen's Univ., Kingston (Ontario). Dept. of Biology.
R. J. Robertson.
Canadian Journal of Zoology, Vol 50, p 247-263, 1972. 3 Fig, 6 Tab, 50 Ref.

Descriptors: *Nesting, *Non-game birds, *Marshes, Wetlands, Wildlife, Wildlife habitat, Water birds, Nests, Vegetation effects, Water levels.

Survival value of different parts of the fundamental niche of the redwinged blackbird was determined by comparing nesting success in marsh and upland habitats. Marsh nesting populations had greater success than those in uplands because of a smaller proportion of nests destroyed by predators. Predation pressure in marshes was negatively correlated with the depth of water beneath the nest, and the synchrony and density of nesting in marshes in some cases has a swamping effect on local predator populations. The structure and phenology of marsh compared with upland vegetation is an important factor in determining nesting density and synchrony. Growth rates of nestlings and weight at fledging are similar between habitats. Genetic separation between marsh and upland populations is unlikely. Territoriality probably results in a limitation to breeding density in both habitats. The results support the hypothesis that where sympatric, redwings are excluded from their optimal niche space by yellow-headed blackbirds. (Steiner-Mass)

FACTORS AFFECTING TISSUE NUTRIENT CONCENTRATIONS IN A SCIRPUS-EQUISETUM WETLAND,
McGill Univ., Montreal (Quebec). Dept. of Biology.
N. D. Auclair.
Ecology, Vol 60, No 2, p 337-348, 1979. 5 Fig, 6 Tab, 39 Ref.

Descriptors: *Distribution patterns, *Nutrients, *Wetlands, Canada, Marsh plants, Succession, Rooted aquatic plants, Potassium, Plant physiology, Plant tissues.

Potassium and nitrogen (12.0-23.5 mg/g) had the highest tissue concentrations followed by Ca Na P Mg. Micronutrient concentrations (Fe Mn Zn Cu) ranged from 0.003-0.532 mg/g. Macronutrients were 1.3-6 times and micronutrients 2-20 times greater than reported in Carex, Fagus, and Quercus dominated ecosystems. All elements except Cu, Na, and Zn had closely similar patterns of interspecies variation. Chelation, ion antagonism, and increased solubility of micronutrients in flooded soils were possible mechanisms accounting for the unique patterns of Cu, Na, and Zn accumulation. Equisetum fluviatile had the highest level of total nutrients in green tissue. This was over twice that in Phragmite communis which had the lowest level. Element concentrations were 22.3% higher in pioneer species and 21.9% lower in mature species when compared to the community average. Edaphic parameters were 4 to 5 times more important than community structural attributes in varying tissue element concentrations. Among soil elements, potassium had the highest correlation with tissue P, K, Ca, and Mg concentration. Soil calcium had the highest correlation with tissue nitrogen and the micronutrients Cu, Fe, and Mn. (Steiner-Mass)

STRUCTURE OF MANGROVE FORESTS IN FLORIDA, PUERTO RICO, MEXICO, AND COSTA RICA,
Puerto Rico Dept. of Natural Resources, San Juan.
D. J. Pool, S. C. Snedaker, and A. E. Lugo.
Biotropica, Vol 9, No 3, p 195-212, 1977. 12 Fig, 5 Tab, 22 Ref.

Descriptors: *Plant morphology, *Mangrove swamps, Wetlands, Trees, Density, Height, Plant growth.

Structural parameters of mangrove forests were measured at seven geographical locations in Florida, Puerto Rico, Mexico, and Costa Rica. The largest basal area and most structurally developed mangrove forests were the riverine forests of the Atlantic coast of Costa Rica and the Marismas Nacionales, Mexico. The smallest basal area was measured for the dwarf mangroves in southeastern Florida and the fringe mangrove on the dry coast of Puerto Rico. Riverine and basin mangrove types had taller canopies than the scrub, fringe, and overwash types. Stand densities were greatest for the fringe forest at Jobos Bay, Puerto Rico and for the dwarf forest or scrub mangroves in Florida. No individual trees greater than 10 cm DBH were reported for either of these sites. Complexity indices ranged from 0.9 (Punta Gorda, Puerto Rico) to 97.5 (Jobos Bay, Puerto Rico). (Steiner-Mass)

COMPARISON OF THE ASSEMBLAGES OF SAP-FEEDING INSECTS (HOMOPTERA-HEMIPTERA) INHABITING TWO STRUCTURALLY DIFFERENT SALT MARSH GRASSES IN THE GENUS SPARTINA,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Entomology and Economic Zoology.
R. F. Denno.
Environmental Entomology, Vol 6, No 3, p 359-372, June, 1977. 12 Fig, 40 Ref.

Descriptors: *Biological communities, *Insects, *Marsh plants, *Salt marshes, Habitat, Wetlands, Marsh management, Marshes, New Jersey, Grasses, Distribution patterns, Spatial distribution.

The vegetation of New Jersey tidal salt marshes is composed primarily of 2 grasses; Spartina patens, which occupies a narrow elevational zone of high marsh and Spartina alterniflora, an intertidal species. S. patens forms a dense, persistent, thatch, while S. alterniflora produces only a loose lattice of litter which rapidly decomposes. A comparison between the guilds of sap-feeding insects (for the most part, Delphacidae, Cicadellidae, Issidae, and Miridae) inhabiting these grasses reveals S. patens housing a much more diverse assemblage of herbivores than S. alterniflora. S. alterniflora-inhabiting species are exclusively bi- or trivoltine, while on S. patens, sap-feeders possess a greater variety of life history types and show a specialized trend toward univoltinism. Removal of only the dead thatch portion of S. patens results in reduced species diversity and evenness of sap-feeders on the living grass system. Trivoltine species, which normally inhabit the upper strata of S. patens, increase their populations on dethatched grass compared to the unaltered grass system. Both empirical and experimental evidence suggests that the complex microstructure and thatch of S. patens provide a more heterogeneous and protective resource which supports a more diverse and specialized fauna of sap-feeders than S. alterniflora. (Steiner-Mass)
W80-03881

PATTERN AND DIVERSITY IN SWAMP AND DUNE VEGETATION, NORTH STRADBROKE ISLAND,
Queensland Univ., Brisbane (Australia). Dept. of Botany.
W. E. Westman.
Australian Journal of Botany, Vol 23, No 2, p 339-354, 1975. 3 Fig, 2 Tab, 23 Ref.

Descriptors: *Distribution patterns, *Marsh plants, *Dunes, Wetlands, Spatial distribution, Swamps, Grasslands, Competition.

The pattern of plant species distribution, species richness, the distribution of resources among species, and the manner of change of these parameters are examined in the closed-heath vegetation of a freshwater swamp, the grassland and low closed-forest of a frontal low dune sequence and the closed sclerophyllous forests of inland high dunes. The floristic diversity and complexity of spatial patterning within a small area is highest in the freshwater swamp vegetation. The complexity of the swamp vegetation is enhanced by a remarkable high species richness, a very low concentration of dominance and a high degree of intermingling of species. The swamp vegetation appears to have undergone a high degree of speciation; at the same time, intermixture of species and the small scale of patterning have served as a means of minimizing intraspecific competition. A REEXAMINATION OF BAGNOLD'S GRANULAR-FLUID MODEL AND BED LOAD TRANSPORT EQUATION,
Scripps Institution of Oceanography, La Jolla, CA.
J. A. Bailard, and D. L. Inman.
Journal of Geophysical Research, Vol 84, No C12, p 7827-7833, December 20, 1979. 6 Fig, 13 Ref.

Descriptors: *Bed load, *Sediment transport, *Model studies, Mathematical models, Flow, Streamflow, Stress, Energy, Sediments, Sands, Rivers, Beds under water, Sedimentology, Bed load transport.

Bagnold's bed load transport model was reexamined by using only the momentum equation, the Coulomb yield criteria, and the definition of the rate of energy dissipation for a shearing fluid. The general form of Bagnold's bed load equation was rederived but with two specific differences: Coulomb's yield criteria, tan phi = T/P, holds only at the interface between regions of shearing and non-shearing grains, and the ratio of the mean to maximum granular velocity enters as an additional factor. (Sims-ISWS)

PARTICLE REWORKING IN SEDIMENTS FROM THE NEW YORK BIGHT APEX: EVIDENCE FROM 234TH/238U DISEQUILIBRIUM,
Yale Univ., New Haven, CT. Dept. of Geology and Geophysics.
J. K. Cochran, and R. C. Aller.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 739-747, December 1979. 5 Fig, 1 Tab, 21 Ref. NOAA 04-4-022-35.

Descriptors: *Sediments, *Cores, *Radioisotopes, *Benthic fauna, Sampling, Data collections, On-site investigations, Coasts, Sludge disposal, Sewage sludge, Water pollution, Uranium radioisotopes, Lead radioisotopes, Sedimentation, Sedimentation rates, Sedimentology, *New York Bight, Thorium radioisotopes.

Two diver-collected cores of mud-rich sediment from the New York Bight apex were analyzed for 238U and 232Th decay series nuclides with emphasis on 234Th/238U disequilibrium. Excess 234Th was present in both cores and showed exponential decrease in the top 4 cm. Biogenic reworking by a deposit-feeding community characterized by a Nucula proxima-Nephtys incisa assemblage apparently controls the form of the 234Th profiles. Mixing coefficients of 0.0000003-0.0000006 sq cm/s were calculated. No decrease of 210Pb with depth (0-11 cm) was found nor was there any vertical structure in profiles of 228Th. Episodic deposition followed by periods of stability cause the observed homogeneity of the longer lived nuclides as well as laminated horizons in the sediment. 234U/238U isotope ratios reflect addition of either seawater or sewage source uranium to the collection area. SUSPENDED MATERIAL DISTRIBUTIONS IN THE WAKE OF ESTUARINE CHANNEL DREDGING OPERATIONS,
Connecticut Univ., Groton. Marine Sciences Inst.
W. F. Bohlen, D. F. Cundy, and J. M. Tramontano.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 699-711, December 1979. 8 Fig, 1 Tab, 11 Ref. ONR N00140-77-C-6536.

Descriptors: *Dredging, *Suspended solids, *Sediments, Rivers, Estuaries, Sediment transport, Particle size, Carbon, Turbidity, Water pollution, Storms, Streamflow, On-site investigations, Sampling, Temperature, Water temperature, Salinity, Coasts, Tidal waters, Connecticut, *Thames River(CT).

Field sampling of the suspended material field downstream of a large volume bucket dredge operating in the Lower Thames River estuary near New London, Connecticut, was conducted in order to examine the magnitude and character of the dredge-induced resuspension and to evaluate typical operational efficiency. These data indicated that approximately 1.5 to 3% of the sediment volume in each bucket-load is introduced into the water column producing suspended material concentrations adjacent to the dredge of 200 mg/l to 400 mg/l. These values exceeded background levels by two orders of magnitude. Analysis of particulate organic carbon and grain size characteristics indicated that resuspension also alters suspended load composition increasing the percentage of inorganic materials and median grain size. Proceeding downstream, material concentrations along the centerline of the dredge-induced plume decrease rapidly approaching background within approximately 700 m. Compositional variations display similar trends with the major perturbations confined to the area within 300 m of the dredge. The observed spatial distributions indicated that the dredge-induced resuspension is primarily a near field phenomenon producing relatively minor variations as compared to those caused by naturally occurring storm events. Previous work has shown that these latter systems can produce estuary-wide variations in suspended material concentrations, increasing the mass of material in suspension by at least a factor of two. This increase in total suspended load is nearly an order of magnitude larger than that produced by the dredge. (Sims-ISWS)

ROLE OF RILL DEVELOPMENT IN SALT LOADING FROM HILLSLOPES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
G. K. Sunday.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-152044, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis, 1979. 107 p, 61 Fig, 13 Tab, 17 Ref, Append. OWRT B-170-COLO(1), 14-34-0001-8067.

Descriptors: Salinity, Water quality, Sediment, Channel behavior, Runoff conductivity, *Rill development simulation, *Sediment yield, Dissolved solids, Mancos shale, *Salt yield, Watershed, *Runoff, Slope, Colorado River Basin.

Field studies of salinity in runoff were conducted by applying runoff directly to the hillslope through a perforated pipe and, secondly, by rainfall simulation to produce runoff. Average electroconductivity (EC), a measure of total dissolved solids, was found to increase with increasing values of slope and after rilling of the hillslope. Rill development and flow velocities are further investigated since both are shown to be significant factors in high salt loads in runoff. Rill development is studied by computer simulation. The generated rill patterns are shown to be comparable to drainage systems measured in the field by Horton (1945). They also show characteristics similar to rill patterns generated in laboratory experiments by Mosley (1972). The results show that slope has a significant effect on the rill patterns as documented by geomorphologists (Zernitz, 1932; Howard, 1967). Keeping the sources fixed, the length of rills produced was shown to vary with slope and cross-slope and total rill length has been shown to be a factor in high sediment yields (Mosley, 1972). The computer simulation is shown to provide considerable promise for further studies of the relationships of geomorphic variables. A laboratory control situation was designed to isolate the effects of: (1) increased flow velocities; (2) different layers of Mancos shale (unweathered and weathered); and (3) particle size of shale. Linear relationships between electroconductivity and increasing flow velocities are provided. Further laboratory results indicated that for the same flow velocity, unweathered Mancos shale yields approximately twice as much salt to the flow as weathered Mancos shale if the two have a comparable size range (exposed surface area). Flow over large sizes of unweathered Mancos shale is shown to give slightly lower values of salinity compared to the weathered Mancos shale in the smaller size range.

SEDIMENTS SUSPENDED IN STREAM FLOW,
Akademiya Nauk SSSR, Moscow. Inst. Okeanologii.
S. M. Antsyferov, and R. D. Kos'yan.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY2, Proceedings Paper 15216, p 313-330, February 1980. 4 Fig, 1 Tab, 37 Ref, 2 Append.

Descriptors: *Sediments, *Suspended solids, *Diffusion, *Streamflow, Velocity, Suspension, Sediment transport, Model studies, Mathematical models, Laboratory tests, Equations, Mathematics, Sedimentology.

This paper considered a stationary translational sediment carrying flow. Correlation with experimental data enabled one to single out reliable solutions from a number of 'traditional' ones which were based on the concept of equality of moment transfer and sediment diffusion coefficients. By making use of energy considerations it became possible to delineate the area of applicability of the traditional diffusion model. An empirical expression was proposed to describe the distribution of concentration in the near-bottom region. The combination of the singled-out solution of the diffusion model with this empirical relationship allowed one to compile an expression describing the distribution of concentration over the entire depth of the flow, and to offer a suitable calculation procedure. SOIL AND WATER LOSSES FROM CORN-SOYBEAN ROTATIONS,
Science and Education Administration, Ames, IA.
J. M. Laflen, and W. C. Moldenhauer.
Soil Science Society of America Journal, Vol 43, No 6, p 1213-1215, November-December 1979. 2 Fig, 2 Tab, 10 Ref.

Descriptors: *Soil erosion, *Crops, *Soybeans, *Corn(Field), On-site investigations, Runoff, Suspended solids, Dissolved solids, Sediments, Sediment yield, Rainfall, Water loss, Agriculture, Erosion control, Soil science.

Many people have observed what they felt was greater soil erosion by wind and water following production of soybeans. This experiment was conducted to measure the actual erosion following soybean production compared to that following corn production. Using natural rainfall plots at Beaconfield, Iowa, soil and water losses were measured from soybeans in a corn-soybean rotation and from corn in this same rotation and grown continuously over a 7-year period. Soil losses were found to be greater following soybeans than following corn in either a corn-soybean rotation or in continuous corn. This means more precautions must be taken to control erosion when soybeans are grown on sloping lands than when corn is grown. (Sims-ISWS)

RECENT GEOCHEMICAL HISTORY OF FLOOD DEPOSITS IN THE NORTHERN CHESAPEAKE BAY,
State Univ. of New York at Stony Brook. Marine

Sciences Research Center.
D. J. Hirschberg, and J. R. Schubel.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 771-784, December 1979. 8 Fig, 26 Ref, 1 Append. NSF OCE7809645.

Descriptors: *Floods, *Sedimentation rates, *Estuaries, *Chesapeake Bay, Radioisotopes, Radioactive dating, Sediments, Geochemistry, Sampling, Cores, Data processing, X-rays, X-ray analysis, Sedimentation, Sedimentology.

210Pb and 137Cs dating of sediment cores from the extreme northern Chesapeake Bay has revealed that episodic sedimentation events associated with Susquehanna River floods in 1936 and 1972 have contributed half of all sediment deposited in this area since 1900. Much of this sediment was derived from resuspension of sediment trapped along the riverbed during years of normal riverflow. The normal 210Pb determined sedimentation rate in this region, excluding flood events, was 0.45 cm/year which is in good agreement with rates previously estimated from sediment budget models. The long term sedimentation rate is probably twice this value which is in agreement with drainage basin sediment yield and denudation rate studies. (Sims-ISWS)

EROSIONAL ASPECTS OF MANAGING URBAN STREAMS,
Rutgers - The State Univ., New Brunswick, NJ. Water Resources Research Inst.
W. Whipple, Jr., J. M. DiLouie, Jr., and T. S. Pytlar, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153422, Price codes: A05 in paper copy, A01 in microfiche. Completion report, January 1980, 76 p, 27 Fig. OWRT B-067-NJ(2), 14-34-0001-8100.

Descriptors: Engineering strucrtures, Channels, *Channel morphology, *Erosion control, Bank stability, *Erosion, Floods, *Stream stabilization, *Urban runoff, Urban drainage, *Urbanization, *Storm runoff, *Culverts, Channel erosion, Channel improvement, *Environmental effects.

The erosional aspects of streams in urbanizing areas were investigated by correlating land use information and physical data on a number of New Jersey streams and by modeling process based upon sediment transport therory. It was concluded (1) that processes of urbanization, by means of increasing rates of runoff, greatly increased bedload capacity and hence erosive capability of streams, (2) that urbanizing streams are vulnerable to channel degradation and increased bank erosion, (3) that in such cases culverts at road crossings which create a retarding effect upon flood flows have a beneficial effect, both in reducing flood peaks downstream and in reducing channel erosion potential, and (4) that in urbanizing areas, an integrated approach appears desirable, including desing of detention basins, design of culverts at road crossings, use of energy dissipating structures, and a program of land use control.

HOLOCENE SEDIMENTATION AT CAPE SABLE, SOUTH FLORIDA,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
H. H. Roberts, T. Whelan, and W. G. Smith.
Sedimentary Geology, Vol 18, p 25-60, 1977. 21 Fig, 4 Tab, 22 Ref.

Descriptors: *Intertidal zone, *Sedimentation, *Florida, Wetlands, Mud flats, Sediments, Shores, Beaches, Mangrove swamps.

A regionally distinct mosaic of sedimentary environments including beaches and beach ridges which formed under relatively high-energy conditions through low-energy, tide-dominated environments to quiescent inland lakes and ponds, exists at Cape Sable, south Florida. Environments of deposition from the sandy capes inland are: shell beaches and beach ridges, black mangrove mudflats, ponded mudflats, exposed mudflats, Lake Ingraham, coastal levees and supratidal plain, and ephemeral ponds. With exception of the beaches and beach ridges, sediments of the other environments are dominantly calcareous muds and silts and represent a depositional history related to frequency of tidal inundation and storms. Cores through the supratidal plain reveal a basal carbonate-mud sequence much like subtidal elements of modern Florida Bay. This unit has a typical marine carbonate-mineral suite, numerous shallow-marine molluscs, and an abundance of Thalassia root burrows. An intermediate intertidal unit characterized by marine-brackish carbonate sediments with algal laminations is overlain by massive aragonitic supratidal silts and silty clays. The entire sequence is capped by a dark, highly organic zone representative of the coastal levee and intervening algal-flat sediments. (Steiner-Mass)

LANGEBAAN LAGOON: A MIXED CARBONATE-SILICICLASTIC TIDAL ENVIRONMENT IN A SEMI-ARID CLIMATE,
Cape Town Univ. (South Africa). Marine Geoscience Unit.
B. W. Flemming.
Sedimentary Geology, Vol 18, p 61-95, 1977. 22 Fig, 1 Tab, 36 Ref.

Descriptors: *Sediment distribution, *Lagoon, Wetlands, Tidal effects, Mudflats, Hydraulics, Salt marshes, Sedimentation, Sediments.

Langebaan lagoon divides physiographically into a north-south sequence following the modern energy gradient. In contrast, sediment distribution is east-west aligned, dividing the lagoon into two major provinces that reflect a different, relict energy regime. The sediments consist predominately of a quartz-carbonate mixture. Both sedimentary components are in hydraulic equilibrium although concentration levels are diametrically opposed. The carbonate content decreases over 40% in the north to less than 5% in the south. The differential concentration is explained by selective separation of the carbonate component during the transportation phase of the sediment. The modern sand banks and intertidal flats are underlain by large fossil oyster reefs dating between 6,000 and 2,000 years B.P. Primary sedimentary structures are environmentally sensitive. Large underwater dunes occur in the channels. The upper intertidal flats, close to the lagoonal beaches are characterized by a distinct association of primary structures. (Steiner-Mass)

AGE, ORIGIN, AND PALAEO-ECOLOGICAL EVIDENCE OF BLANKET BOGS IN NORD-TRONDELAG, NORWAY,
Trondheim Univ. (Sweden). Dept. of Botany.
U. Hafsten, and T. Solem.
Boreas, Vol 5, p 119-141, 1976. 9 Fig, 1 Tab, 25 Ref, 2 Append.

Descriptors: *Bogs, *Stratigraphy, *History, Wetlands, Peat, Palynology, Geologic time, Soil profiles, Pollen, Fens, Succession, Palaeoclimatology.

Pollen diagrams, C14-datings, and peat stratigraphy are presented from three sides in the Forradal sub-oceanic area in Nord-Trondelag, a moorland complex of flat and sloping fens and blanket bogs. The vegetational and climatic history during the last 8500 years is described, together with a survey of present-day conditions. This origin of the blanket-bog areas is shown to agree generally in both time and mode of genesis, with similar bog types in Scotland and northern England. Dates are given for the expansion of both alder and spruce, the latter occurring more than 1000 years later than in southeastern Norway. The possible role of provenance formation and Roman Iron Age amelioration of the climate is discussed in this connection. The course of the alder pollen curve indicates a drier and probably colder type of climate about 3000-2400 B.C. (Steiner-Mass)

Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153232, Price codes: A02 in paper copy, A01 in microfiche. Completion Report 77-5, January 1980. 7 p. OWRT B-037-ALAS(1), 14-34-0001-8056.

Descriptors: Public health, Water, Domestic water, Potable water, *Arsenic, Gold, *Subsurface waters, Surface water, Alaska, *Path of pollutants, *Geologic mapping, *Ester Dome area(Alaska).

Geologic mapping of the Ester Dome area more clearly defined the previously recognized mineralized region there. Analyses of well cuttings from domestic wells show that the rocks in which some of the wells are drilled are enriched in arsenic and serve as an immediate source of arsenic to the groundwater flowing into the well. The primary source of arsenic in the waters is this arsenic-bearing sulfide mineralization. Stream sediments near mineralized areas tend to be enriched in arsenic, suggesting this analysis of stream sediments might be useful for geochemical prospecting for sulfide minerals and the accompanying gold mineralization. Garden vegetables grown with arsenic-enriched water tend to become somewhat enriched in arsenic, but a much greater health hazard comes from drinking this water.

Descriptors: *Mixing, *Model studies, *Geothermal studies, *Thermal springs, *Geochemistry, Springs, Aquifers, Stable isotopes, Thermometers, Groundwater recharge, Gases, Meteoric water, Sampling, Silica, *Israel, *Geothermometers, *Noble gases, Ionic ratios.

Mixing models and evaluation of Si02 contents of warm-water manifestations in the Jordan-Dead Sea Rift Valley indicate that these waters are fed by aquifers with estimated temperatures of up to 68C. These calculations and Na/K ratios; concentrations of Na, K, and Ca; concentrations of atmospheric Ne, Ar, Kr, and Xe; and concentrations of the stable hydrogen and oxygen isotopes all indicate below-boiling temperatures. No indications are available for the existence of above-boiling geothermal systems in the Jordan Rift Valley. Slightly higher than observed temperatures are concluded for a deep component at the springs of

Hammat Gader (67C), Gofra (68C), the Russian Garden (40C), and the Yesha well (53-65C). These temperatures may encourage further developments for spas and bathing installations and, to a limited extent, for space heating, but are not favorable for geothermal power generation. (Visocky-ISWS)

KINETICS OF CHEMICAL PROCESSES IN A CARBONATE AQUIFER: A CASE STUDY OF WATER-ROCK INTERACTION IN THE AQUIFER OF WESTERN AND CENTRAL GALILEE (ISRAEL),
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Inst. of Soil and Water.
A. Nadler, M. Magaritz, F. Mazor, and U. Kafri.
Journal of Hydrology, Vol 45, No 1/2, p 39-56, January 1980. 5 Fig, 7 Tab, 27 Ref.

Descriptors: *Kinetics, *Carbonate rocks, *Aquifers, *Chemical reactions, *Water chemistry, Geochemistry, Geologic control, Groundwater movement, Dolomite, Chemical analysis, Sampling, Retention, Bicarbonates, Alkalinity, Saline water, *Water-rock interaction, *Chemical processes, *Israel, Ionic ratios.

The origin of ions in the groundwater of the western and central Galilee (W.C.G.) aquifer is attributed to the dissolution of carbonate rock. Similar chemical compositions have been obtained in laboratory experiments that simulated natural conditions. The field and experimental data indicate the time dependency of ionic composition. A linear correlation was found between the Mg(2+) concentration and the aquifer decay time. The kinetic factors of the W.C.G. groundwater were found to resemble other carbonate-aquifer waters, e.g., in Pennsylvania and Virginia. (Visocky-ISWS)

EFFECT OF BENZOATE ON MICROBIAL DECOMPOSITION OF FULVIC ACIDS IN TJEUKEMEER (THE NETHERLANDS),
Institute of Limnology, Nieuwersluis (Netherlands).
H. de Haan.
Limnology and Oceanography, Vol 22, No 1, p 38-44, January 1977. 5 Fig, 1 Tab, 20 Ref.

Descriptors: *Micerobial degradation, *Tjeukemeer(The Netherlands), Netherlands, *Acids, *Molecular structure, Microbiology, Microorganisms, Cultures, Size, Growth rates, Bacteria, Fluorescence, Metabolism, Arthrobacter, Sewage effluent, Humic acids, Ecology, Distribution, Absorption.

Microbial processes as well as hydrology may play a role in seasonal fluctuations in fulvic acid molecular size distribution in Tjeukemeer, The Netherlands. Results of media gel filtration containing fulvic acid clearly demonstrate that Arthrobacter microorganisms from Tjeukemeer affect molecular size distribution of fulvic acids. Moreover, the elution pattern before and after Arthrobacter growth on concentrated lake water to which benzoate had been added shows that fulvic acid fraction II is dependent on microbial activity. Benzoic acid additions affect both bacterial growth and color changes in incubated Tjeukemeer water; flourescence also significantly decreases. The observed effects indicate benzoate stimulation of fulvic acid microbial decomposition. Benzoate has a priming effect; it enhances the slowly proceeding decomposition process by actively metabolizing microbes. Although Arthrobacter cell yield on fulvic acid alone is 25 micro g/ml, benzoic acid additions to fulvic acid medium increases cell yield to 100 micro g/ml. The medium Sephadex elution pattern is affected by growing Arthrobacter cells. Before growth the medium contains fulvic acid fraction FI and benzoate. After growth benzoate disappears and a second fulvic acid fraction FII appears. Fraction FII, formed during Arthrobacter growth, is a FI derivative of relatively smaller size. (Danovich-Wisconsin)

Descriptors: *Landslides, *Inlets(Waterways), *Waves(Water), On-site investigations, Mathematical models, Coasts, Shores, Bays, Estuaries, Canada, *Submarine slides, *Kitimat Inlet(British Columbia).

A major submarine slide occurred on April 27, 1975, in Kitimat Inlet in the Douglas Channel system on the west coast of Canada. Following this slide at least two water waves were observed, and it was estimated that the range (crest plus trough) of the first wave could have been 8.2 m. Two simple theories were used here to estimate the wave height. By considering the uncertainties both in the observed data as well as in the calculated wave height, there was reasonable agreement. Descriptors: *Oceanography, *Gulf of Mexico, *Remote sensing, Satellites(Artificial), On-site investigations, Currents(Water), Ocean currents, Meanders, Circulation, Ocean circulation, Water circulation, Water temperature, Infrared radiation, Loop Current(Gulf of Mexico).

Satellite infrared data and in situ data were combined to study synoptic-scale and mesoscale fronts in the Gulf of Mexico in the period 1973-1977. Deep northward penetrations of the Loop Current were noted in the winter, and a major warm gyre developed in the winter, 1974. Other major warm gyres were seen to develop in the early spring (1974 and 1977). In all cases, a very large meander developed off the southern part of the west Florida shelf prior to the development of the major warm gyre. Smaller meanders were seen to move along the Loop Current boundary at an average speed of 28 km/day and with an average wavelength of 210 km. (Sims-ISWS)

J. C. Duinker, R. Wollast, and G. Billen.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 727-738, December 1979. 9 Fig, 19 Ref.

Descriptors: *Manganese, *Estuaries, *Rivers, Sampling, On-site investigations, On-site data collections, Chemical analysis, Chemicals, Suspended solids, Dissolved solids, Salinity, Hydrogen ion concentration, Oxidation-reduction potential, Geochemistry, Sediments, Coasts, Oceans, Oceanography, Water chemistry, *North Sea coast, *Rhine Estuary, *Scheldt Estuary.

Measurements of dissolved and particulate suspended Mn concentrations throughout the Rhine and Scheldt estuaries were interpreted in terms of cycling processes of Mn. Dissolved Mn is removed in the lower estuary into particulate form. This gives rise to elevated Mn concentrations in coastal suspended matter; particulate Mn is also partially returned to the upper estuary by estuarine circulation processes. Dissolved Mn is produced in the upper estuary by dissolution of particulate Mn either in the water column owing to the low pH and Eh prevailing at low salinities or in the anoxic sediments, from where it subsequently diffuses into the overlying water. Budget calculations and other arguments showed that a significant part of the Mn carried down by the river is recycled between the lower and upper estuaries. An important part accumulates within the sediments; the fraction that escapes to the marine environment is mainly in particulate form. Very similar conclusions can be drawn for the two estuaries with quite different residence times of both water and particulates. (Sims-ISWS)

SURF ZONE DYNAMICS DURING UPWELLING ON THE OREGON COAST,
Williams Coll., Williamstown, MA. Dept. of Geology.
W. T. Fox, and R. A. Davis, Jr.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 683-697, December 1979. 9 Fig, 14 Ref. ONR N00014-69-C-0151.

Descriptors: *Coasts, *Beaches, *Upwelling, *Oregon, Beach erosion, Erosion, Deposition(Sediments), Sand bars, Winds, Weather, Tides, Atmospheric pressure, Waves(Water), Ocean waves, Currents(Water), Surf zone.

A 45-day time series study was conducted along the central Oregon coast during July and August 1973. The North Pacific Subtropical High dominated the weather pattern with strong north winds and coastal upwelling. Waves were 1-3 m high with periods of 6 to 9 s. The upwelling was interrupted when low pressure systems passed over the coast. With the low pressure, the wind shifted to the southwest, and the wave height increased. Rip currents and southward longshore currents in the surf zone reached 90 cm/s. The mixed diurnal-semidiurnal tide along the coast had a spring tide range of 4 m. Three beaches were mapped at low tide once every three days. At South Beach, Oregon, 2 sets of bars advanced shoreward at 1 to 5 m/day and expanded to the south at 5 to 15 m/day. A longshore trough and rip channel system which was active at mid-tide separated the bars. At Beverly Beach, a basalt ridge formed an island 400

m long and 730 m offshore. The island functioned as a detached breakwater and formed a protuberance on the beach. Sand bars and rip channels built up on the protuberance and migrated 200 m to the south. At Gleneden Beach, cusps with a wavelength of 40 m were formed on the steep foreshore. Rhythmic topography formed by bars and rip channels with a wavelength of 300 m developed on the nearshore. The bars advanced across the rip channel at 5 m/day and welded onto the foreshore. THE ECOLOGY OF SANDY BEACHES IN PENANG, MALAYSIA, WITH SPECIAL REFERENCE TO EXCIROLANA ORIENTALIS (DANA),
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
D. A. Jones.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 677-682, December 1979. 3 Fig, 21 Ref.

Descriptors: *Beaches, *Biological communities, *Isopods, *Asia, Shores, Physical properties, Sampling, Waves(Water), Tropical regions, Biology, *Malaysia, *Penang(Malaysia), Surf zone.

The physical characteristics of a series of beaches of differing exposure on Penang Island, Malaysia, were measured, and the macrofauna were collected quantitatively. The zonation of the fauna on the upper and mid-shore agreed with that described for other tropical beaches, but the sudden transition to mud on the lower shore was exceptional. Excirolana orientalis has a wide distribution on the shore, and its relationship with similar isopods in other areas, where they occur together on the beach, was discussed. (Sims-ISWS)

THE SUBLITTORAL ECOLOGY OF THE MENAI STRAIT, I. TEMPORAL AND SPATIAL VARIATION IN THE FAUNA AND FLORA ALONG A TRANSECT,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
R. Hoare, and M. E. Peattie.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 663-675, December 1979. 4 Fig, 3 Tab, 20 Ref.

Descriptors: *Biological communities, *Currents(Water), *Tidal waters, Spatial distribution, Temporal distribution, Current meters, Measurement, Sampling, Turbidity, Scour, Erosion, Data processing, Ecology, Marine biology, *Menai Strait(Wales), Sublittoral organisms, Tidal currents.

The Menai Strait is a narrow channel subject to strong tidal currents but little wave action. The major physical factors which interact to control the nature and distribution of the fauna and flora are turbidity, scouring, current strength, and substratum. A simple device, based upon a spring balance, was used to measure maximum current strength near the bottom. The distribution of the fauna was studied by a transect survey across the Channel and compared with a similar survey in the same place 20 years earlier. The results suggested a high biological stability although some population fluctuations do take place. It was suggested that such general surveys be supplemented by more detailed investigations of individual species. (Sims-ISWS)

Descriptors: *Tidal waters, *Tides, *Channel flow, *Estuaries, Coasts, Harbors, Water circulation, Analog models, Canals, Open channels, Dredging, Flood control, Hydrodynamics, Hydraulics, Coastal engineering.

Alternating hydraulic flow (typical of estuarine areas) cannot be accurately treated using techniques developed for open channels or for the open oceans. As tidal energy approaches our coastlines, the potential energy is converted to kinetic energy resulting in forced vibrations within our estuarine systems. These 'hydraulical vibrations' are periodic rather than truly harmonic but can be considered to be harmonic for a first-order approximation. By making the analogy to electrical alternating current flow with a quadratic resistance term the equation of motion of tidal channel flow can be written. Solution of this harmonic equation in simplified form leads to expressions for channel resistance, channel capacitance, and channel inductance which combine, according to the phase angle between tidal amplitude and tidal current, to form channel impedance. These equations reduce to the familiar Darcy-Weisbach equation for steady-state open channel flow. (Sims-ISWS)

Estuarine and Coastal Marine Science, Vol 9, No 6, p 713-726, December 1979. 12 Fig, 9 Ref.

Descriptors: *Phytoplankton, *Physical properties, *Oceans, Coasts, Continental shelf, Salinity, Temperature, Water temperature, Currents(Water), Ocean currents, Density, Nutrients, Oceanography, *Fronts(Oceanic), *Scotland coast, *Irish coast.

A shelf sea front exhibiting strong salinity influence was described. Temperature plays only a secondary role in controlling the density although the frontal position conforms to the h/cu u model. Velocity measurements by current meters and radio drogues have defined the tidal flow and indicated residual currents of about 20 cm/s parallel to the front. These flows were time dependent with flow reversal occurring in the lower part of the water column. The observed velocity shear was of the same order as, but not in precise agreement with, the geostrophic shear inferred from the density gradient. In vivo and extracted chlorophyll measurements showed that phytoplankton standing crop at the front was several times greater, and was healthier, than that in the mixed water inshore. Chlorophyll was vertically stratified at the front and in the density-layered water offshore. High standing crop at the front may be explained in terms of nutrient availability to algae in the euphotic zone. The complex physical and biological processes influencing frontal productivity were discussed. (Sims-ISWS)

THE EFFECTS OF OYSTER SHELL DREDGING ON AN ESTUARINE BENTHIC COMMUNITY,
University of South Florida, Tampa. Dept. of Biology.
W. G. Conner, and J. L. Simon.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 749-758, December 1979. 5 Fig, 1 Tab, 18 Ref.

Descriptors: *Dredging, *Effects, *Biological communities, *Benthic fauna, *Florida, Coasts, Bays, Estuaries, Oysters, Shellfish, Sediments, Cores, Sampling, On-site investigations, Biomass, Biology, *Tampa Bay(FL), Dredging effects, Oyster shells, Species composition.

This paper described the extent and nature of the effects on the benthos of physical disruptions associated with dredging fossil oyster shell. Two dredged areas and one undisturbed control area in Tampa Bay, Florida, were quantitatively sampled before dredging and for one year after dredging. The immediate effects of dredging on the soft-bottom community were reductions in numbers of species (40% loss), densities of macroinfauna (65% loss), and total biomass of invertebrates (90% loss). During months 6-12 after dredging, the analysis used (Mann-Whitney U Test, alpha = 0.05) showed no difference between dredged and control areas in number of species, densities, or biomass (except the E sub 1 area). Community overlap (Czeckanowski's coefficient) between dredged and control areas was reduced directly after dredging, but after 6 months the pre-dredging level of similarity was regained. (Sims-ISWS)

HYDROCHEMISTRY OF DISSOLVED INORGANIC CARBON IN THE ST. LAWRENCE ESTUARY (CANADA),
Quebec Univ., Rimouski. Dept. of Oceanography.
E. Pelletier, and J. Lebel.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 785-795, December 1979. 6 Fig, 2 Tab, 25 Ref.

Descriptors: *Water chemistry, *Estuaries, *St. Lawrence River, Chemicals, Alkalinity, Variability, Seasonal, Sampling, Chemical analysis, Temperature, Water temperature, Salinity, Carbon, Carbonates, Runoff, Discharge(Water), Hydrology, Dissolved inorganic carbon.

The concentration and the distribution of dissolved inorganic carbon were studied in the Upper St. Lawrence Estuary during three seasons in 1976. The data collected by the authors show that the dilution area directly influenced by the St. Lawrence River (mean annual discharge of 11300 cu m/s) is demarcated by the isohaline of 32.5 parts per thousand. The seasonal variations of the alkalinity of freshwater can attain 40%, but the quantity of bicarbonate ions brought by the river varies less than 8% from season to season. Budget calculations of dissolved CaC03 indicate that 45000000 tons per year is provided by the St. Lawrence River. This figure is almost 12 times more than all the suspended matter transported from the same source. (Sims-ISWS)

THE DESIGN AND USE OF AN OSCILLATING TROLLEY WAVE-SIMULATOR, FOR INSTALLATION IN UNIDIRECTIONAL FLOW FLUMES,
University Coll. of Swansea (Wales). Dept. of Geology and Oceanography.
T. M. Hammond, and M. B. Collins.
Estuarine and Coastal Marine Science, Vol 9, No 6, p 801-811, December 1979. 6 Fig, 19 Ref, 1 Append.

Descriptors: *Flumes, *Equipment, *Waves(Water), *Laboratory equipment, Sediment transport, Current meters, Flow, Shallow water, Hydraulic models, Oceanography, Wave generators.

The constructional details of an oscillating trolley arrangement, for installation in commercially available unidirectional flumes, was described. The apparatus was composed of commercially produced subassemblies and readily available materials. The oscillating trolley and flume were used to simulate combinations of oscillatory (representing near-bed oscillatory motion of waves in shallow water) and unidirectional flows in investigations concerned with the response of various current meter impellers and the threshold of (Woodhead) seabed drift-

ers and noncohesive sand-sized sediment; some of the results of these investigations, of particular relevance to coastal oceanographic investigations, were summarized. (Sims-ISWS)

WETLANDS OF THE SOUTH-WEST OF WESTERN AUSTRALIA WITH SPECIAL REFERENCE TO THE BUSSELTON AREA.
Australian Department of Fisheries and Wildlife, Perth, 1978, 18 p, 3 Fig, 2 Tab, 3 Ref.

Descriptors: *Wetlands, *Australia, Ecology, Wildlife habitat, Management, Wildlife, Marsh management, Estuaries, Swamps.

General information is given on the wetlands (swamps, rivers, estuaries) of the south-west of Western Australia, their value as wildlife conservation areas, their ecology, and some of the problems of their management. Particular attention is directed towards the wetlands of the Busselton area; namely, the Broadwater, Wonnerup and Vasse Estuaries. A brief account of their value to wildlife and their need for management is given. An outline of the future management trends of these areas is also provided. (Steiner-Mass)

LOW PRESSURE BRACKISH WATER REVERSE OSMOSIS MEMBRANE DEVELOPMENT - FINAL REPORT,
UOP, Inc., San Diego, CA. Fluid Systems Div.
C. E. Milstead, and R. L. Riley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153539, Price codes: A07 in paper copy, A01 in microfiche. Report to Office of Water Research and Technology, February 1980, 130 p, 40 Fig, 22 Tab. OWRT (No 7511) (1), 14-34-0001-7511.

Descriptors: *Membranes, *Reverse osmosis, *Brackish water, *Desalination, Spiral-wound elements, New Mexico, Arizona, *Roswell(N Mex), Yuma(Ariz), Composite membranes.

The principal objective of this three phase program was to develop a thin-film composite membrane system capable of yielding approximately 20 gal/ft to the 2nd power-day of product water from a brackish feed at 200 psi applied pressure with a rejection of 98%. Four types of composite membranes, prepared by interfacial polycondensation techniques on a fabric-reinforced porous polysulfone support, were evaluated. The optimum membrane, a polyamide, designated TFC-202, was successfully produced in large quantities for spiral-wound element fabrication. This membrane, yielding approx. 24 gal/ft to the 2nd power-day and approx. 98.5% rejection from a Yuma feedwater at 200 psi applied pressure, was fabricated into 2 1/2-,4-,and 8-in. diam. x 40-in. wide elements for field testing at the OWRT Test Facility at Roswell, N.M.

DESIGN OF AN INDIRECT FREEZING PROCESS PILOT PLANT BASED ON BULK CRYSTALLIZATION,
Johnson (Wallace E.) Co., Topsfield, MA.
W. E. Johnson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153596, Price codes: A04 in paper copy, A01 in microfiche. Final Report to Office of Water Research and Technology, December 1978. 36 p, 9 Fig, 3 Tab.

Descriptors: *Desalination, *Freezing, Indirect freezing, *Pilot plants, Design, Costs.

This report covers the rationale and design of a 2000 gpd pilot plant to demonstrate Indirect Freezing with bulk crystallization for desalination of water. During the 1950's indirect freezing processes utilizing film or block freezing were investigated and found to be uneconomical. This is a study of a process that employs the simplicity of indirect freezing without the cost of scraped surface heat exchangers on poor thermal efficiency of film or block freezing. An economic study made on the same basis as a recent OWRT commissioned report, showed a water cost of $1.74/1000 gallons at 5 MGD. Calculated energy consumption for a mature 1 MGD plant is 29.2 KW-HR/1000 gal. The pilot plant design is large enough to allow scaling to commercial size yet small enough to facilitate study of bulk crystallization. The estimated 1978 pilot plant cost is $225,000.

TECHNICAL AND ECONOMIC ASSESSMENT OF SOLAR DISTILLATION FOR LARGE SCALE PRODUCTION IN FRESH WATER.
Bechtel Corp., San Francisco, CA. Research and Engineering.
Available from the National Technical Information Service, Springfield, VA 22161 as SAND77-8176, Price codes: A05 in paper copy, A01 in microfiche. Document prepared for Sandia Laboratories, Livermore, California, December 1977, 68 p, 20 Fig, 9 Tab, 3 Ref.

Descriptors: *Desalination plants, *Desalination processes, *Comparative costs, *Distillation, *Solar distillation, Treatment facilities, Desalination, Water treatment, Water purification, Desalination apparatus, Fuel costs, Economics, Equipment, Evaluation, Separation techniques, Solar stills, Solar energy, Economies of scale.

A review of existing technology and of expected rises in fuel-oil costs reveals that, while it is presently cheaper to distill potable water by means of an oil-fired distillation plant (assuming plant size of 5 million gallons/day), costs of distilling water from solar-driven and oil-fired plants will by equal within 15 years. The study concludes: (1) Water costs from a solar-driven vertical tube evaporation (VTE) distillation unit will become competitive with those from oil-fired distillation units within 15 years if annual fuel escalation costs remain in excess of 5%. (2) A comparative assessment of competing solar collector designs should be conducted to identify the economic choice of solar energy collection systems for a distillation plant. (3) Performance of distillers operating with solar power plant waste heat should be evaluated. (4) Water costs from solar stills in some developing countries may be competitive with solar-driven and oil-fired conventional distillers. An existing facility cost audit adjusted to the present time

frame is needed. Research efforts included a literature survey of single- and multi-effect solar stills and solar-driven conventional distillation units. A simplified conceptual design is given of a candidate plant and of a non-solar distillation plant, and an economic comparison is made of alternative designs. (Harris-Wisconsin)

3B. Water Yield Improvement

INTERIM PROGRESS REPORT SUPPLEMENT A -- DATA ANALYSIS, SCPP DATA COLLECTION AND ANALYSIS FOR THE PERIOD 1 JANUARY 1979 THROUGH 30 JUNE 1979,
Atmospherics Inc., Fresno, CA.
M. E. Solak, R. B. Allan, and T. J. Henderson.
Prepared for the Office of Atmospheric Resources Management, Department of the Interior, Water and Power Resources, January 31, 1980. 107 p, 92 Fig, 1 Tab. 9-07-85-V0020.

Descriptors: *Mountains, *Hydrologic data, *Meteorological data, *Precipitation(Atmosphoric), Precipitation gages, Cloud seeding, Weather modification, Sierra Nevada, California, Ice, Snowfall, Rainfall intensity.

Precipitation measurements and ice nucleus counter data collected in the American River Basin in the Sierra Nevada during a six month period in 1978 and 1979 are analyzed. Data were collected from precipitation gages, surface meteorological stations, ice nucleus counters, high volume filter samples, and snow samplers. The data were prepared manually from manually-reduced records. Interpretation of precipitation measurements for the area are complicated by the mountainous terrain, however, the relationship between gage elevation and precipitation accumulation seen in the traverse profiles was considered during isohyetal map production. The manually-produced barrier traverse profiles reflect gage spacing along the traverse with precipitation amounts expressed in millimeters. A general seasonal pattern of increasing precipitation accumulations at increasing elevations is seen for the windward slopes of the barrier with decreasing amounts on the lee slopes, however, some cases differed substantially from this pattern. Precipitation rates analyzed represent the maximum houly accumulation. Ice nucleus measurements are plotted with concentrations expressed in numbers per liter at -20C. Data presented for priority 1, 2, and 3 cases and for significant precipitation periods include a brief description of the case, maps of gage locations, I-80 traverse precipitation profiles, and maps of ice nucleus counter sites with concentrations. 3C. Use Of Water Of Impaired Quality

ENTEROVIRUS INACTIVATION IN SOIL AND STRUCTURAL CHANGES ASSOCIATED WITH THE INACTIVATION OF SOIL-BOUND VIRUSES,
New Mexico State Univ., Las Cruces. Dept. of Biology.
J. G. Yeager, and R. T. O'Brien.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-149255, Price codes: A04 in paper copy, A01 in microfiche. New Mexico Water Resources Research Institute, New Mexico State University Report No 111, November 1979. 75 p, 12 Fig, 10 Tab, 62 Ref. OWRT A-052-NMEX(7), 14-34-0001-9033.

Descriptors: *Water reuse, *Sewage sludge, *Irrigation, *Soil bacteria, *Viruses, Soil types, Soil properties, Soil water movement, Evaporation, Soil moisture, Arid lands, Evaluation, Enterovirus, Coxsackievirus, Polio virus, *Virus inactivation.

The inactivation of polioviruses in soil was examined. It was shown that the inactivation of radioactively labeled poliovirus type-1 and coxsackievirus B-1 in soils saturated with surface water, groundwater and septic tank liquor was directly proportional to temperature. Virus persistence was also related to soil type and the liquid amendment in which viruses were suspended. No infectivity was recovered from dried soil regardless of temperature, soil type, or liquid amendment. Evaporation was largely responsible for the decreased recovery of infectivity from drying soil, however, increased rates of inactivation at low soil moisture levels may have amplified the virucidal effects of soil evaporation. The experimental results indicated that the loss of infectivity of poliovirus in moist and dried soils was a result of irreversible damage to the virus particles. Results suggest that polioviruses are inactivated by different mechanisms in moist and drying soils. Taken together, the findings suggest that any virus hazard associated with the application of wastewater or sewage sludge to agricultural land can be greatly reduced or eliminated by allowing the soil to dry after waste application. AN EVALUATION OF MARGINAL WATERS AS A NATURAL RESOURCE IN ISRAEL,
Technion-Israel Inst. of Tech., Haifa. Faculty of Agricultural Engineering.
N. Buras, and P. Darr.
Water Resources Research, Vol 15, No 6, p 1349-1353, December 1979. 1 Fig, 5 Tab, 5 Ref.

Descriptors: *Water reuse, *Brackish water, *Water resources, *Model studies, Mathematical models, Water demand, Water supply, Water sources, Evaluation, Costs, Cost analysis, Cost comparisons, Planning, Water importing, Arid lands, *Israel.

The scarcity of water in Israel and its possible effect on the socioeconomic development of the country have evinced considerable interest in the utilization of marginal waters. A nonlinear mathematical model was formulated, whose dual solution has shown that urban wastewater and brackish water have substantial values ranging up to 65% of the cost of imported freshwater. The nonlinear production function in the mathematical model permitted the detailed analysis of the impact of the economies of scale on the primal and dual solutions. The optimal allocation of water for the Central Negev in 1992 calls for 40% of the forecast total water demand to be supplied by 26 million cu m of treated urban wastewater and brackish water. (Sims-ISWS)

THE POTENTIAL FOR MUNICIPAL WASTEWATER REUSE BY INDUSTRY IN MASSACHUSETTS,
Massachusetts Univ., Amherst. Water Resources Research Center.
J. Pratte, and W. Litsky.
In: Proceedings Water Reuse Symposium, March 25-30, 1979, Washington, D.C., Vol 2, p 1235-1246, 1979. 1 Fig, 5 Tab, 5 Ref. OWRT A-114-MASS (2).

Descriptors: *Water reuse, *Waste water, *Water conservation, *Industrial water, Attitudes, Massachusetts.

This investigation sought to determine the suitability of wastewater reuse by industry as a water conservation measure in terms of social, economic, institutional and technological feasibility. Personal interviews, guided by a questionnaire, were held with industrial and public sector individuals. The results indicated that industry is more accepting of wastewater reuse than water resource officials if a project is cost-effective. Although there are few suitable industrial recipients of reclaimed water in Massachusetts, the concept is worthy of more attention as water costs increase, sewage treatment plants are upgraded and alternative water supplies are sought. ALGAE GROWN ON WASTEWATER AS A SOURCE OF PROTEIN FOR YOUNG CHICKENS AND RATS,
Technion-Israel Inst. of Tech., Haifa (Israel). Dept. of Food Engineering and Biotechnology.
S. Mokady, S. Yannai, P. Einav, and Z. Berk.
Nutrition Reports International, Vol 19, No 3, p 383-390, March 1979. 1 Fig, 4 Tab, 11 Ref.

Descriptors: *Wastewater treatment, *Beneficial use, *Feeds, *Aquatic algae, *Poultry, *Rodents, *Proteins, Micractinium, Chlorella, Oocystis, Scenedesmus, Chlorophyta, Foods, Sewage lagoons, Oxidation lagoons, Flocculation, Amino acids, Soybeans, Carp.

A study was made to estimate protein nutritive value of several algae species grown on wastewater, as a protein source in diets of young chickens. Rat feeding tests were also carried out, to determine the protein nutritive value of the different algae species and using PER values as a parameter. Results of the rat studies show that most algal samples have a fairly high protein nutritive value, as judged by PER values, even when algae was the only dietary protein source. However, best growth performance for chickens was obtained when algal protein was substituted only for 25% of soybean protein. Algae samples were incorporated into the rations of the experimental chickens as a partial replacement (25-50%) for soybean protein. In studying rat diets, dietary protein was derived from algae alone, from algae and soybean meal in equal parts and from algae supplemented by methionine and lysine; the latter substances are limiting amino acids in algal proteins. Algal samples used in feeding experiments were grown on sewage and drum-dried after harvest. Oocystis, Scenedesmus and Micractinium containing 38.5%, 48.7% and 51% protein, respectively, were harvested by flocculation with alum. Chlorella-euglena consisting mainly of Chlorella sp, containing 54% protein, was harvested by centrifugation. This study is presented as part of a two-paper series; other research discusses secondary toxicology and contaminants which algae pick up from wastewater and the degree to which these toxins are passed on to rats fed chicken and carp fish raised on wastewater algae. (Harris-Wisconsin)
W80-03817

SECONDARY TOXICOLOGY AND CONTAMINANTS OF ALGAE GROWN ON WASTEWATER,
Technion-Israel Inst. of Tech., Haifa (Israel). Dept. of Food Engineering and Biotechnology.
S. Yannai, S. Mokady, K. Sachs, B. Kantorowitz, and Z. Berk.
Nutrition Reports International, Vol 19, No 3, p 391-400, March 1979. 4 Tab, 20 Ref.

Descriptors: *Waste water treatment, *Toxicity, *Feeds, *Aquatic algae, *Human pathology, *Poultry, *Carp, Micractinium, Chlorella, Beneficial use, Chlorophyta, Oxidation lagoons, Sewage lagoons, Phosphates, Foods, Phosphorus, Mercury, Copper, Lead, Arsenic, Food chains, Rodents.

A study was conducted to evaluate the wholesomeness of animals (broiler chicken and carp fish) raised on rations containing a large quantity of algae of different species grown on wastewater. Results of secondary toxicity tests indicate that rats raised on diets containing chicken or fish which had been fed wastewater-grown algae did not differ significantly from rats fed chicken and fish which had received control rations. The amount of toxic metals in the unicellular algae (Chlorella and Micractinium) was high, but the only animal tissues affected were chickens' livers. Organochlorine pesticide levels in algae were low in all cases, but considerable PCB levels were found in all plants. There were large amounts of mercury, copper, lead and arsenic in muscle tissues of experimental chicken and mercury in experimental carp liver; these high concentrations did not bring about

corresponding high levels in animal tissues because unusually large amounts of phosphorus (especially as phosphate) occurred in all algae samples assayed. All four of the metals form water-soluble salts with phosphate; it is possible that these metals are thus rendered unabsorbable from the gastrointestinal tract. (Harris-Wisconsin)

3D. Conservation In Domestic and Municipal Use

RESIDENTIAL WATER REUSE,
California Univ., Los Angeles. School of Architecture and Urban Planning.
M. Milne.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-155377, Price codes: A23 in paper copy, A01 in microfiche. Technical Completion Report, California Water Resources Center, Davis Report No 46, September 1979. 553 p, 12 Fig, 4 Append. (California Water Resources Center Project UCAL-WRC-W-537).

Descriptors: *Water reuse, *Impaired water use, *Recirculated water, *Reclaimed water, *Water supply, *Architecture, Buildings, Construction, Construction materials, Structural design, Design, Planning, *Domestic wastes, *Domestic use, Beneficial use, *Water conservation, *Public health, *Water law.

Greywater, rainwater, groundwater, and surface water are sources of 'free' water already available to every homeowner on-site. This book explains the various ways to collect, store, treat, and distribute this water, and gives examples of how it has been successfully reused for toilet flushing, landscape irrigation, washing, bathing, or drinking. For many of these functions water can be reused directly without treatment. The argument in favor of water reuse is given along with a brief history of residential water reuse, how rainwater and groundwater can be developed as an on-site supply, the uses of greywater for garden irrigation, various residential-scale systems that have been designed for on-site reuse, and an explanation of the components needed to build such systems. The appendix contains a directory of manufacturers, a glossary of specialized terms, units of measure, and an annotated bibliography containing over 500 citations. The conclusion of this study is that residential on-site water reuse systems are already technically feasible and environmentally sound, and are becoming more economically attractive every day, due primarily to the rapidly increasing cost of energy required for pumping and treatment by centralized water and sewage systems. The objective of this book is to help homeowners, builders, developers, architects, planners, and lawmakers understand the design and installation of small on-site residential water reuse systems. (Snyder-California)

3F. Conservation In Agriculture

FLOW CONTROL DEVICES PARTICULARLY USEFUL FOR DRIP IRRIGATION,
M. Drori.
U.S. Patent No 4,173,309, 7 p, 25 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 988, No 1, p 103, November 6, 1979.

Descriptors: *Patents, *Irrigation, *Application equipment, *Flow control, Irrigation practices, Irrigation efficiency, Irrigation operation and maintenance, Drip irrigation.

The fluid flow control devices described are particularly useful as drip irrigation emitters provided with flow regulation to reduce their pressure-sensitivity, enabling them to be used in long lines and in undulating terrain. The disclosed devices include a first flexible plastic strip bonded on one surface to a second plastic strip along bond lines defining a pressure-dropping passageway. A third plastic surface is bonded to the opposite surface of the first flexible plastic strip along bond lines defining a static pressure chamber in which the first flexible plastic serves as a common wall with the chamber and the passageway for at least part of the length of the passageway. Thus variations in the velocity of the fluid through the pressure-dropping passageway causes the common wall to be flexed to vary the cross-sectional area of the passageway and to regulate the fluid flow. Both linear-source emitters and point-source emitters are described. (Sinha-OEIS)

LITIGATION OF THE RECLAMATION LAW IN THE IMPERIAL VALLEY: WHO HAS STANDING TO CHALLENGE WHICH LAW,
R. J. Michael.
California Water Law Review, Vol 14, No 3, p 563-589, 1979.

Descriptors: *California, *Federal reclamation law, *Irrigation programs, Judicial decisions, Federal jurisdiction, Agriculture reclamation, Water law, Legal aspects, Federal government, Legislation.

Since the early 1900's, the federal government has joined private efforts to improve agricultural reclamation in the Imperial Valley of California. Today, the government's involvement in the irrigation project is the object of judicial interpretation. One difficult issue is who has standing to challenge the various sections of reclamation law. The United States (U.S.) Supreme Court has recently tightened traditional standing requirements in the decisions of Worth v. Seldin and Simon v. Eastern Kentucky Welfare Rights Organization. The U.S. Ninth Circuit Court of Appeals has applied these standing requirements to efforts to challenge the 1902, Reclamation Act. In case of U.S. v. Imperial Irrigation District, the Court resolved the acreage limitation issue, but the Court refused to hear the residency requirements issue. Consequently the plaintiffs were denied access to the federal courts to challenge the nonenforcement of the Act. The present conflicts in the reclamation law should be resolved by congressional clarification instead of judicial interpretation. The Act's residency requirement and acreage limitations have not been amended since 1926. If not clarified the underlying purpose of the 1902 Reclamation Act assisting the family farmer will have been subverted. (Wilson-Florida)

AEROMONAS DISTRIBUTION AND SURVIVAL IN A THERMALLY ALTERED LAKE,
Du Pont de Nemours (E.I.) and Co., Aiken, SC. Savannah River Lab.
C. B. Fliermans, R. W. Gorden, T. C. Hazen, and G. W. Esch.
Applied and Environmental Microbiology, Vol 33, No 1, p 114-122, January 1977. 11 Fig, 5 Tab, 15 Ref.

Descriptors: *Heated water, *Fish parasites, *Fish populations, *Water pollution effects, *Epizootiology, Aeromonas hydrophila, Thermal pollution, Par Pond(SC), Nuclear reactors, Fishkill, Pest control, Water temperature, Distribution, Cooling water, Epizoites, Mortality, Aquatic bacteria, Dissolved oxygen.

The survival and distribution of Aeromonas hydrophila in heated natural waters was studied August 1975-1976 in Par Pond, a monomictic lake used as a cooling reservoir for a production nuclear reactor at Savannah River Plant, Aiken, South Carolina. Although it is unclear whether aeromonad survival in Par Pond is due directly to thermal inputs or indirectly related to flow rates and/or nutrient distributions caused by reactor operations, it is clear that aeromonads are ubiquitous throughout the pond and that bass populations are heavily infected by these etiological agents of red sore disease. Aeromonas is commonly pathogenic to fish, frogs, reptiles and humans. Fish populations in the lake have lesions of epizooty from which Aeromonas spp. are readily isolated. Distribution and population densities of this ubiquitous aquatic bacterium were measured seasonally in the water column along an oxygen and temperature gradient. Greater Aeromonas densities occur below the oxygen chemocline when the reservoir is stratified. Survival levels of pure A. hydrophila cultures correspond to distribution patterns of naturally occurring Aeromonas-like populations. Greater survival of A. hydrophila during full reactor operation suggests that fish populations may be exposed to Aeromonas for a longer period of time than when the reactor is not operating. MANAGEMENT OF ELODEA IN AUSTRALIAN IRRIGATION SYSTEMS,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Irrigation Research.
K. S. Bowmer, G. R. Sainty, G. Smith, and K. Shaw.
Journal of Aquatic Plant Management, Vol 17, p 4-12, June 1979. 2 Fig, 5 Tab, 53 Ref.

Descriptors: *Irrigation canals, *Australia, *Herbicides, *Aquatic weed control, Irrigation, Irrigation ditches, Irrigation systems, Aquatic plants, Submerged plants, Aquatic weeds, Plant growth regulators, Ammonia, Economics, Environmental effects, Management, Aromatic compounds, Ecology, Plant populations, Distribution.

Obstructuve elodea weed growth in Australian irrigation canals is temporarily controlled by injection of the herbivide acrylaldehyde (acrolein) and aromatic solvents or ammonia into flowing water; however, major research emphasis is on finding more economical and permanent controls. Other treatments considered economical for smaller irrigation canals include short-term, high-concentration injections of endothal alkylamine salts and simazine applications after canal drainage. However, acrolein is the only herbicide suitable for larger irrigation canals for reasons of convenience, economy, and safety. Chlorfenac is exceptionally effective for longer control and eradication, but due to its water solubility it is not available. Dichlobenil is only moderately effective and is expensive. Placement techniques and slow-release formulations

with alginates, polymers or invert emulsions may make other aquatic weed control methods available in the future. Elodea is not effectively controlled by non-chemical methods. Elodea is a native plant of North America; it was first noticed in Southeast Australian irrigation systems in 1957-1958 and is particularly troublesome in larger supply and drainage canals which carry water throughout the irrigation season. Elodea is a submerged perennial plant which thrives in temperate climatic zones. In Australia, it survives the winter in moist situations in a semidormant state. (Danovich-Wisconsin)

ASSESSMENT OF AQUATIC WEED PROBLEMS,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Irrigation Research.
D. S. Mitchell.
Journal of Aquatic Plant Management, Vol 17, p 19-21, June 1979. 1 Tab, 5 Ref.

Descriptors: *Aquatic weed control, *Data collections, *Analytical techniques, Ecology, Aquatic weeds, Economics, Size, Computer programs, Data processing, Developing countries, Decision-making, Inspection, Surveys, Testing procedures, Plant populations, Plant growth, Sites, Invasion.

A field assessment form for aquatic weed control characterizes the site, identifies weeds, assesses their nuisance status and appraises potential to promote or inhibit water quality. The field assessment form is useful for aquatic weed evaluations to be carried out systematically and objectively particularly in developing countries, since the sole assessment criteria in many cases is weed population size. The suggested form encompasses main data types likely to be important in full problem evaluation. The assessment form includes evaluation of ecological and economic factors on a quantitative basis and data is suitable for computer storage and analysis. Coding is employed for data such as type of water body, weed introduction method, and species name. Aquatic weed ecology factors include hydrological regime stability, nutrient status, climatic conditions, plant growth and reproduction potential, plant effects on environmental physicochemical and biotic factors and whether plants are alien species. An essential requirement for predicting increase in weed population size is an estimate of plant growth rate in the conditions present at the infestation site. Plant vigor, as shown by health and size, indicates site suitability. Temperature and nutrient availability varies seasonally, therefore, it is undesirable to measure growth rates at the most favorable and unfavorable seasons. (Danovich-Wisconsin)

A NEW APPROACH FOR SALVINIA CONTROL,
Queensland Dept. of Lands, Brisbane (Australia).
G. Diatloff, A. N. Lee, and T. M. Anderson.
Journal of Aquatic Plant Management, Vol 17, p 24-27, June 1979. 3 Fig, 2 Tab, 14 Ref.

Descriptors: *Herbicides, *Aquatic weed control, *Surfactants, *Salvinia, Chemcontrol, 2,4-D, Aquatic plants, Aquatic weeds, Environmental effects, Oil, On-site tests, Sulfonates, Floating plants, Kerosene, Toxicity, Water hyacinth, Australia.

Experiments show that a mixture of 20 g diuron and 150 g calcium dodecylbenzene sulfonate per liter of formulation with acetone and kerosene as cosolvents completely controls the aquatic weed salvinia. The above mixture is diluted 1 to 10 with kerosene and is available in Australia for large scale experimental purposes under the code name AF 101. Kerosene phytotoxic properties were recognized for many years but its ability to spread out as a very thin layer on water was limited. Oil-soluble surfactant calcium dodicylbenzene sulfonate additions in low concentrations to kerosene greatly increases it spread over both water and salvinia emergent fronds. The surfactant at 1.5%-2.0% W/V gives significantly better results than at lower concentrations. Additions of herbicides, 2,4-D and dishlorprop significantly improve kerosene/surfactant effects, but do not give complete control. Herbicide diuron additions at all levels give complete control. AF 101 is also successful for large scale experimental treatment of red azolla and water lettuce. Formula modification to incorporate 2,4-D instead of diuron completely controls water hyacinth problems. Submersed species are unaffected by the floating herbicide. Water contamination following AF 101 application is minimal implying that this technique is environmentally acceptable. (Danovich-Wisconsin)
W80-03827

THE USE OF MULTIPLE INVERSION AND CLEAN-FLO LAKE CLEANSER IN CONTROLLING AQUATIC PLANTS,
Clean-Flo Labs., Inc., Hopkins, MN.
R. L. Laing.
Journal of Aquatic Plant Management, Vol 17, p 33-38, June 1979. 7 Fig, 6 Tab, 9 Ref.

Descriptors: *Aquatic weed control, *Destratification, *Nutrient removal, *Crystal Lake(MN), Edina Pond(MN), Peavey Lake(MN), Aquatic plants, Aquatic weeds, Chemcontrol, Turnovers, Water circulation, Nutrients, Pondweeds, On-site tests, Chemical precipitation, Submerged plants, Plant growth regulators, Plant growth, Plant populations, Filamentous algae, Algae.

Monitoring of effects of Multiple Inversion and Clean-Flo Lake Cleanser upon aquatic plant communities in three Minnesota lakes June-October 1974 shows that in the long-term, submergent plants will probably respond to nutrient reduction. A Multiple Inversion system introduces microscopic bubbles into the bottom water, inducing turnover. Clean-Flo Lake Cleanser, a soluble calcium compound, accelerates phosphorus removal. Crystal Lake has 29.5 ha area and 10.7 m maximum depth. Edina Pond, 2.4 ha, serves as a storm sewer reservoir and has 1.0 m average depth and 2.0 m maximum depth. Peavey Lake has 2.6 ha area, is 27.4 m deep and is connected to 6444 ha Lake Minnetonka by a 100 m long channel. Until 1970, Peavey served as a sewage settling pond. Edina Pond responded least to treatment since it was completely flushed with storm water runoff after treatment. In Crystal Lake, filamentous algae completely disappeared after treatment but temporary regrowth occurred after heavy rains Flatstem pondweed declined 79% in Crystal Lake, but then recovered completely after June rains. Peavey Lake, treated after the rains, had an immediate 99% decline in filamentous algae compared to controls. After repeated treatment the following year, flatstem pondweed and filamentous algae were controlled 90-100% in Crystal Lake and coontail, Berchtold's pondweed, western pondweed, and filamentous algae were controlled 90-100% in Edina Pond. (Danovich-Wisconsin)

ESTABLISHMENT OF WATERHYACINTH WEEVIL POPULATIONS IN LOUISIANA,
Louisiana Dept. of Wildlife and Fisheries, Baton Rouge.
J. H. Manning.
Journal of Aquatic Plant Management, Vol 17, p 39-41, June 1979. 1 Fig, 1 Tab, 6 Ref.

Descriptors: *Water hyacinth, *Louisiana, *Aquatic weed control, *Biocontrol, *Plant growth regulators, Herbicides, 2,4-D, Aquatic plants, Aquatic weeds, Hosts, Integrated control measures, Biological treatment, Chemcontrol, Swamps, Insects, Population, Reproduction, Vegetative reproduction.

After two water hyacinth weevil species (Neochetina eichhorniae and Neochetina bruchi) were introduced in Louisiana in 1974, water hyacinth vegetative reproduction stress was observed. Flowering at Sorrento and Alexandria, nursery areas for N. eichhorniae weevils, was reduced in 1976. Damage by N. eichhorniae and the severe 1977 winter combined to elimate water hyacinth plants from Sorrento. N. bruchi populations are increasing but are presently being invaded by N. eichhorniae. Pure N. bruchi populations probably cannot be established in Louisiana to be used for collection and release on a large scale basis. The Louisiana Department of Wildlife and Fisheries is optimistic that both weevil species are aiding water hyacinth control programs, especially in areas inaccessible to herbicide spray crews. Aerial surveys in November 1977 disclosed an estimated 480,000 ha of water hyacinth in Louisiana. Much of this infestation occurs in dense South Louisiana swamps, where access by spray crews is limited by 5 cm-0.6 m water levels. Chemical control with 2,4-D began in 1946 and continues today. However, to control water hyacinth in inaccessible swamp areas, host-specific biological agents, two species of South American weevil, were introduced. (Danovich-Wisconsin)

BIOLOGICAL CONTROL OF HYDRILLA VERTICILLATA ROYLE WITH GRASS CARP (CTENOPHARYNGODON IDELLA VAL),
University of Central Florida, Orlando. Dept. of Biological Sciences.
J. A. Osborne, and N. M. Sassic.
Journal of Aquatic Plant Management, Vol 17, p 45-48, June 1979. 3 Fig, 4 Tab, 18 Ref.

Descriptors: *Biocontrol, *Carp, *Fish establishment, *Aquatic weed control, *Little Lake Barton(FL), *Fish stocking, Aquatic plants, Aquatic weeds, Integrated control measures, Plant growth regulators, Biomass, Plant growth, Water temperature, Primary productivity, On-site tests, Fish populations, Fish diets, Number fish per acre, Management.

Stocking of grass carp was the major factor in a decline of hydrilla during October 1976-October 1978 in Little Lake Baront, Florida. Annual mean hydrilla biomass was 1.700 kg fr wt/sq m for 1976-1977 and 0.923 kg fr wt/sq m for 1977-1978, representing an annual 45.7% decrease in biomass. Net primary productivity was -8.0 g/sq m/d for 1976-1977 and -22.0 g/sq m/d for 1977-1978 or approximately three-fold lower during the second study year. Hydrilla biomass in October, 1977 was 22.1% lower than in October, 1976; hydrilla biomass in October, 1978 was 55.5% lower than in October, 1977. Hydrilla biomass leveled off when it reached 2.2 kg fr wt/sq m in August, 1977, while it reached only 1.012 kg wt/sq m by October, 1978. Although the lowest temperature occurred during the second year, seasonal trends were similar between study years. Little Lake Barton, Orange County, Florida with 1.63 m mean depth, is a 5.42 ha solution basin which has had hydrilla infestation since 1971. Initial grass carp stocking in October 1976 consisted of 32 fish/ha with 2.6 kg/ha mean weight. During August 1977 a fish kill occurred and in October 1977, 15 fish/ha were placed in the lake. Selective grass carp removal at the end of two years provided a 13 fish/ha population estimate and 90.13 kg/ha biomass. (Danovich-Wisconsin)

TAXONOMIC CHARACTERISTICS OF AQUATIC PLANTS FROM THE ALIMENTARY TRACT OF GRASS CARP,
Florida State Game and Fresh Water Fish Commission, Eustis. Eustis Fisheries Research Lab.
C. C. Carter, and R. S. Hestand.
Journal of Aquatic Plant Management, Vol 17, p 49-53, June 1979. 10 Fig, 7 Ref.

Descriptors: *Classification, *Carp, *Aquatic weed control, *Digestion, *Plant tissues, Systematics, Aquatic plants, Animal physiology, Biodegradation, Food habits, Diets, Plant morphology, Plant physiology, Vascular tissues, Plant groupings, Leaves, Speciation, Macrophytes, Algae.

This paper constructs a taxonomomic key to help identify various plant species ingested by grass carp. Key characters in identifying macrophytes when masticated are included. Ten aquatic macrophytes and one high algae were selected for investigation: Brazilian elodea, hydrilla, eelgrass, pondweed, cabomba, Eurasian watermilfoil, common bladderwort, southern naiad, coontail, dwarf arrowhead and muskgrass. Larger pondweed fragments are obtained in the analysis; however, the

long and narrow thread-like capillary divisions of fanwort and Eurasian watermilfoil are easier to identify. These thread-like divisions are discernible and apparently pass through the mastication process almost intact. Plants with longer, broader leaves such as pondweed and eelgrass, suffer more damage in the grinding process. Discernible fragment characters are found for all hydrophytes investigated except common bladderwort where fragments are ground beyond recognition. Coontail leaf apex is rounded to truncate with two spines located an equal distance from apex producing a horned-like appearance. Minute subtle character differences are found between elodea and hydrilla. Brazilian elodea leaves exhibit a distinct smooth margin and surface texture and have small marginal teeth pointing forward. Hydrilla leaves exhibit a distinct scabrous or harsh marginal and surface texture and bear minute teeth directed outward. (Danovich-Wisconsin)

EFFECTS OF MECHANICAL CUTTING ON SUBMERSED VEGETATION IN A LOUISIANA LAKE,
Louisiana Dept. of Wildlife and Fisheries, Baton Rouge.
R. E. Johnson, and M. R. Bagwell.
Journal of Aquatic Plant Management, Vol 17, p 54-57, June 1979. 3 Fig, 3 Tab, 5 Ref.

Descriptors: *Mechanical control, *Harvesting, *Aquatic weed control, *Lake Bistineau(LA), *Black Bayou Lake(LA), Aquatic weeds, Aquatic plants, Biomass, Submerged plants, Plant growth, Costs, Plant growth regulators, Root development, Rooted aquatic plants, Eutrophication, Plant populations, Management, Control, Vegetation regrowth, Cutting management.

Large scale mechanical cutting of submersed vegetation in Louisiana reservoirs is not feasible. The limited period of control gained by cutting vegetation is offset by the comparatively slow machine operation rate. Using mechanical cutting machines to open or maintain boat roads through rooted, submersed vegetation could be beneficial; however, the area cut would have to be extremely large for cost/ha figures to be economically feasible. Costs for 86 operating days during the 1975 season on Lake Bistineau, Louisiana, amounted to $34.27/ha. Operating and maintenance expenses for this time period were $1,081 and labor costs were $1,541. Annual depreciation on equipment was $2,284 and down-time was 34.5% of project time cost. Vegetation cut in May was near the surface again in late August, indicating only temporary control over submersed rooted vegetation. On Black Bayou Lake, average egeria, coontail and bladderwort biomass varied 1036-1712 g/sq m in July 1975. Two months after cutting, biomass varied 834-1388 g/sq m. Regrowth from rooted plants began immediately and continued until September. Average regrowth length varied 29-30.5 cm. In order to evaluate egeria cutting survival, 500 cuttings were introduced into sample plots; 365 new plants were produced indicating that serious problems with new aquatic weed infestations could occur in non-infested portions of a water body by cut plant fragments movements. (Danovich-Wisconsin)

MECHANICAL HYDRILLA CONTROL IN ORANGE LAKE, FLORIDA,
Army Engineer District, Jacksonville, FL.
J. T. McGehee.
Journal of Aquatic Plant Management, Vol 17, p 58-61, June 1979. 1 Fig.

Descriptors: *Mechanical control, *Harvesting, *Aquatic weed control, *Orange Lake(FL), Aquatic weeds, Aquatic plants, Biomass, Plant growth, Costs, Cutting management, Plant growth regulators, U.S. Army Corps of Engineers, Equipment, Integrated control measures.

Aqua-Trio equipment controlled Hydrilla in 65 ha of Orange Lake, Florida for four months in 1977; this included 42 km of trail and 14 use areas. During this period 1100 loads of hydrilla were cut and disposed of either in openwater disposal areas or on upland. Load weights ranged 776-1869 kg indicating that 1,452,500 kg of hydrilla were removed. Total costs were $73,200; cost/ha was $1,125 for the full period. Costs are competitive with chemical control methods. Disposing cut vegetation in lake shallows and increasing the time between recuts can effectively double the work that can be performed. In areas of almost complete infestation, mechanical systems are effective tools in intergrated hydrilla control. Equipment results are direct and immediate. Orange Lake is located in north central Florida and has a 5,261 ha surface area. It is historically a prime fishing lake for largemouth bass and bream. The lake was over 90% infested with hydrilla in 1976. (Danovich-Wisconsin)

BRITISH COLUMBIA AQUATIC PLANT MANAGEMENT PROGRAM,
Department of the Environment, Victoria (British Columbia).
P. R. Newroth.
Journal of Aquatic Plant Management, Vol 17, p 12-19, June 1979. 3 Fig, 4 Tab, 24 Ref.

Descriptors: *Okanagon Valley, British Columbia, Canada, *Herbicides, Aquatic weed control, *Mechanical control, *Eurasian watermilfoil, Aquatic plants, Aquatic weeds, Lakes, Plant populations, Distribution, Plant growth regulators, Harvesting, Chemcontrol, 2,4-D, Water management(Applied), Project planning, Institutions, Administration, Control.

Main components of the British Columbia Aquatic Plant Management Program are: survey, mapping and documentation of Eurasian watermilfoil (Myriophyllum spicatum); ecological research; mechanical and chemical control technology evaluation; and attempts at containment and quarantine. Since 1975 detailed mapping of Eurasian watermilfoil populations has been performed and by 1977 this plant occupied 580 ha in Ikanagan Valley mainsten lakes, British Columbia. Approximately 205 ha were treated by mechanical methods in 1978. Equipment includes harvesters, rotovators, and small diver-operated suction dredges. Rotovators operate over a much longer season than harvesters; however, their speed is slow and costs are high compared to harvesting. Small diver-operated suction dredges are particularly valuable in removing plants adjacent to water intakes, around docks, breakwaters and other obstacles. Because of high diver pay rates and slow operation speed, these units are practical only in small new infestation areas. Fragments generated by harvesters and rotovators must be contained by floating barriers deployed around machine operation to prevent regrowth and further Eurasion watermilfoil expansion. Herbicide 2,3-D is effective and kills plant roots in most treatments. However, permits must be obtained to ensure that levels are below 0.001 ppm near public water intake systems. Buffer zones of 200-1500 m between treatment areas and active water intakes are recommended. (Danovich-Wisconsin)

FORMULATING AQUATIC WEED MANAGEMENT PROGRAMS,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Div. of Irrigation Research.
D. S. Mitchell.
Journal of Aquatic Plant Management, Vol 17, p 22-24, June 1979. 2 Tab, 7 Ref.

Descriptors: *Aquatic weed control, *Cost-effectiveness, *Cost-benefit analysis, *Analytical techniques, *Economics, Aquatic plants, Aquatic weeds, Management, Water management(Applied), Costs, Environmental effects, Methodology, Decision-making, Multiple-purpose projects, Evaluation, Testing procedures, Aesthetics.

Cost-effectiveness analysis provides a framework for systematic evaluation of both quantifiable and non-quantifiable data relevant to aquatic weed management. This approach is merited when expensive control measures are needed in complex situations. Cost-effectiveness analysis is a systematic method of selecting alternatives by rational evaluation and cost and effectiveness comparisons. Cost-effectiveness characteristics are: (1) objectives are carefully formulated and unambiguously stated; (2) both non-quantifiable and quantifiable factors are considered; (3) judgements based on experience are employed in the analysis; (4) alternative courses of action are explicitly evaluated; (5) alternative selection is based either on fixed costs or fixed effectiveness; and (6) all factors required to reach a sound decision are objectively displayed for the decision-maker. Weighting criteria may also be assigned by pair comparisons and sensitivity analysis may be performed on the tabulated data. A simplified cost-benefit analysis approach is also outlined. Its major disadvantage is that all factors are evaluated in commensurate money units; this is difficult for ecological and aesthetic benefits or detriments. It is also difficult to estimate, in financial terms, adverse effects of aquatic weed control measures. (Danovich-Wisconsin)

DEVELOPMENT OF GROUND WATER IN THE HOUSTON DISTRICT, TEXAS, 1970-74,
Geological Survey, Austin, TX. Water Resources Div.
R. K. Gabrysch.
Texas Department of Water Resources Report 241, January 1980. 49 p, 22 Fig, 6 Tab, 22 Ref.

Descriptors: *Groundwater, *Withdrawal, *Water supply, *Water level fluctuations, *Aquifer man-

agement, *Drawdown, Water quality, Saline water intrusion, Water resources development, Aquifer characteristics, Texas, *Houston district, Chicot aquifer, Evangeline aquifer, *Harris County(Tex), *Galveston County(Tex).

Total withdrawals of ground water in the Houston district, Texas, increased 9 percent from about 488 million gallons per day in 1970 to about 532 million gallons per day in 1974. The average annual rate of increase from 1960 to 1969 was about 6.3 percent. During 1970-74, increases in pumpage occurred in the Houston, Katy, and NASA areas; decreases occurred in the Pasadena and Alta Loma areas; and the pumpage in the Baytown-La Porte and Texas City areas remained almost constant. Water levels continued to decline throughout the district during 1970-74, but the rate of decline generally was not as great as in previous years. The greatest declines in the past several years were in the Houston area, but the center of decline is still in the Pasadena and Baytown-La Porte areas. The decrease in the rate of decline suggests that the aquifers in the Houston district could support the amount of pumping during 1970-74 with little, if any, further decline. Although saltwater encroachment has probably occurred in the district, particularly in Galveston County, no large increases in chloride were measured at the monitoring points. (Kosco-USGS)

DISSOLVED OXYGEN AND BIOCHEMICAL OXYGEN DEMAND,
Cook Coll., New Brunswick, NJ. Dept. of Environmental Science.
J. V. Hunter.
In: River-Quality Assessments; Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. p 73-83, 1978. 25 Ref.

Descriptors: *Water quality, *Biochemical oxygen demand, *Mathematical models, *Laboratory tests, Rivers, Measurement, Kinetics, Oxygen demand, Dissolved oxygen, Model studies, Mathematics, Analytical techniques, Methodology, On-site tests, Analysis, Aquatic environment, Benthal oxygen demand, Sediment oxygen demand.

As a measure of effluent and receiving water organic matter content, the BOD determination has been justifiably criticized. However, it is the only determination that indicates the oxygen consumptive capacities of organics in receiving water. The problems associated with the determination involve the mathematical description of the kinetics, extrapolation to actual stream conditions, and, in common with the benthal oxygen demand, difficulty in separating photosynthetic respiration from actual net oxygen consumption. THE EFFECT OF THE DEGREE OF MINERALIZATION OF WATER ON PHYTOPLANKTON,
Gosudarstvennyi Nauchno-Issledovanii Inst. Ozernogo i Rechnogo Rybnogo Khozyaistva, Gorkii (USSR). Gorkii Lab.
L. I. Pushchina.
Hydrobiological Journal, Vol 14, No 4, p 99, 1978.

Descriptors: *Phytoplankton, *Salinity, *Dominant organisms, Habitats, Water chemistry, Adaptation, Aquatic algae, Diatoms, Cyanophyta, Biomass, Salt tolerance, Seasonal, Ponds, Agriculture.

The algal flora in fish-breeding ponds was studied. Despite differences in salinity more than 40 species of algae were common to all the ponds. The number of Protococcaceae species decreased with increasing salinity. The Euglenophyceae and Volvocaceae were mainly freshwater forms found predominantly under conditions of minimum salt content. The content of dissolved salts also affects the quantitative development of the algae. The mean seasonal biomass of the phytoplankton was greatest in ponds with the lowest water salinity and least in those with the highest salinity. (Deal-EIS)

The Nautilus, Vol 94, No 1, p 1-2, 1980. 4 Ref.

Descriptors: *Clams, Fouling, *Water supply, Spatial distribution, Habitats, Delaware River, Chesapeake Bay, Ecological distribution, Migration, Benthic fauna, Oil refinery, *Rangia.

Rangia cuneata is commonly found in fresh and brackish coastal waters from Chesapeake Bay to Texas. This paper reports on the first appearance of R. cuneata in Delaware Bay. Adult specimens were collected from the water system of an oil refinery. It is assumed that the clams migrated through the Chesapeake-Delaware Canal which connects northern Chesapeake Bay with the Delaware River. The biofouling problems created by the clam are discussed. AN ARTIFICIAL MICROBIAL ECOSYSTEM FOR DETERMINING EFFECTS AND FATE OF TOXICANTS IN A SALT-MARSH ENVIRONMENT,
Environmental Research Lab., Gulf Breeze, FL.
A. W. Bourquin, M. A. Hood, and R. L. Garnas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 181, Price codes: A02 in paper copy, A01 in microfiche. Development in Industrial Microbiology, Vol 18, p 185-191, 1977. 4 Fig, 1 Tab, 13 Ref. EPA-600/J-77-075.

Descriptors: *Research equipment, *Bioassay, *Bacteria, *Salt marshes, Laboratory tests, Laboratory equipment, Metabolism, Mode of action, Toxicity, Radioisotopes, Radiochemical analysis, Tracers, Microbial degradation, Monitoring, Methodology, *Parathion.

An artificial laboratory environment designed to determine microbial interactions with pollutant chemicals is proposed. The system is designed to obtain maximum reproducibility between replicates by dividing a single tank into separate closed chambers. Radiolabeled toxicants are added directly to the core-chambers and monitored for metabolic breakdown. Further information is obtained easily on changes in microbial, physiological indexes induced by the toxicants. Techniques for monitoring effects on the methyl parathion on the microbial population and the fate of this chemical are given. (Deal-EIS)

COMPARISON OF VARIOUS METHODS FOR ESTIMATING THE QUALITY OF WATER BASED ON BOTTOM-DWELLING INDICATOR INVERTEBRATES,
Ukranian Hydrobiology Inst. Kherson (USSR). Kherson Hydrobiological Station.
T. G. Moroz.
Hydrobiological Journal, Vol 14, No 3, p 96-99, 1978. 1 Tab, 11 Ref.

Descriptors: *Bioindicators, *Analytical techniques, *Water quality, Benthic fauna, Rivers, Methodology, Monitoring, Mathematical models, Oligochaetes, Diptera, Mollusks, Aquatic insects, Dniepr River.

The application of a number of methods for the monitoring of pollution on various sections of the Lower Dniepr has made it possible to recommend the method of Gudnight and Whitley, which should be further perfected in accordance with the Drachev classification adopted in the Soviet

Union. Reasons are given why other methods described in the literature cannot be used for rivers of this type. (Deal-EIS)
W80-03673

QUANTITATIVE EXTRACTION OF CHLORINATED ORGANIC PESTICIDES AND POLYCHLORINATED BIPHENYLS FROM FISH ORGANS AND TISSUES,
Institute of Experimental Meteorology Obrinsk (USSR).
E. I. Babkina, and T. I. Bobovnikova.
Hydrobiological Journal, Vol 14, No 3, p 85-87, 1978. 2 Fig, 1 Tab, 7 Ref.

Descriptors: *Chemical analysis, *Methodology, *Solvents, Analytical techniques, Testing procedures, Chemical properties, Pesticide kinetics, Chlorinated hydrocarbon pesticides, Polychlorinated biphenyls, Gas chromatography, *Tissue analysis.

A relationship is shown to exist between the extracting agent and the rate of extraction of chlorinated organic pesticides (COP) and polychlorinated biphenyls (PCB). Maximum extraction can be achieved only with polar solvents (acetone, esters, alcohols), followed by redistribution of the pesticides from these solvents into nonpolar solvents (hexane, petroleum ether). A method is proposed for the separate determination of COP and PCB in fish organs and tissues. The sensitivity of this method is equal to 0.001-0.006 mg/100 g fish oil for COP and 0.01-0.02 mg/100 g fish oil for PCB. The detection of COP and PCB amounts to 70-90%. (Deal-EIS)
W80-03674

A METHOD FOR STUDYING THE EXCRETORY FUNCTION OF FISH KIDNEYS UNDER CHRONIC EXPERIMENTAL CONDITIONS,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
V. D. Romananko, and N. I. Kotsar.
Hydrobiological Journal, Vol 14, No 3, p 99-101, 1978. 2 Fig, 7 Ref.

Descriptors: *Analytical techniques, *Fish physiology, *Methodology, Laboratory tests, Testing procedures, Bioassay, Research equipment, Fish behavior, Aquaria, Sampling, *Fish kidney function, *Urinalysis.

A method is described for collecting urine samples in fish through a chronic bladder fistula applied in the abdominal wall region. The urine flowing through the fistula tube is collected in a special urine collector attached to the anal fin, from which it is taken out with a thin flexible tube, the free end of which is kept on the surface of the water with a float, while the other end is inserted into the urine collector. With the aid of the method proposed here, urine can be collected from free-swimming fish without taking them out of the water. (Deal-EIS)

VARIATION IN THE REACTIONS OF DAPHNIA MAGNA STRAUS TO THE EFFECT OF A TOXICANT AS RELATED TO ITS DELIVERY REGIME,
Kaspiiskii Nauchno-Issledovatelskii Inst. Rybnogo Khozyaistva, Astrakhan (USSR).
S. N. Kushnikova.
Hydrobiological Journal, Vol 14, No 4, p 86-91, 1978. 2 Tab, 11 Ref.

Descriptors: *Toxicity, *Daphnia, *Bioassay, *Methodology, Organic compounds, Acids, Analytical techniques, Testing procedures, Mode of action, Chemical properties, *Acetic acid.

The reaction of Daphnia to interrupted and intermittent regimes of exposure to a toxicant may differ appreciably from the reactions to constant exposure. The choice of a constant regime in toxicological experiments is not apparently always justified, since the interrelationship between the organism and the poison are more complex than would appear on the basis of data obtained from stable exposure. At the maximum concentrations of the toxicant (acetic acid) the exposure regime does not have a significant influence on Daphnia. The strength of the stimulating or inhibiting action of the toxicant is largely dependent on the frequency with which the solutions are changed. An interrupted regime has a lesser toxic effect than an intermittent regime. (Deal-EIS)

THE RELATIONSHIP BETWEEN VERTEBRAL NUMBER AND WATER TEMPERATURE IN COD,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Lab.
K. Brander.
J. Cons int Explor Mer, Vol 38, No 3, p 286-292, 1979. 3 Fig, 2 Tab, 1 App, 15 Ref.

Descriptors: *Water temperature, *Growth rates, *Toxicity, Marine fish, Fish physiology, Fish populations, Animal growth, Atlantic Ocean, Thermal stress, Adaptation, North Atlantic, British Isles, *Cod, Tissue analysis, *Vertebrae.

An inverse relationship between water temperature during early development and mean vertebral number (VS, includes urostyle) is established for cod populations throughout the North Atlantic, but the extent to which differences in VS are inherited is unknown. The VS of different year classes of cod from the North Sea shows some dependence on water temperature and the year class should therefore be taken into account, where possible, when seeking evidence of separation between stocks. Values of VS for populations around the British Isles are plotted on the chart of mean March surface temperature and in general agree with the established temperature-VS relationship. Two areas for which the vertebral numbers seem anomalous are the English Channel and the northeast Irish Sea and these anomalies are discussed. (Deal-EIS)
W80-03680

A REVIEW OF THE LETHAL AND SUBLETHAL EFFECTS OF MERCURY ON AQUATIC LIFE,
Imperial Chemical Industries Ltd., Brixham (England). Brixham Research Lab.
D. Taylor.
Residue Reviews, Vol 72, p 33-69, 1979. 6 Tab, 142 Ref.

Descriptors: *Mercury, *Toxicity, *Aquatic life, Mortality, Mode of action, Aquatic algae, Mollusks, Crustaceans, Freshwater fish, Salmonids, Water chemistry, Heavy metals, Water temperature, Salinity, Lethal limit, Bioassay, Chemical properties, *Bioavailability, *Methylmercury.

One hundred scientific papers published between 1937 and 1976 have been reviewed as part of an attempt to assess the environmental significance of mercury in natural waters. In general, the lethal effects on aquatic life of both inorganic and organic mercury compounds appear at concentrations greater than ten microg/l. Similarly, sub-lethal responses to inorganic mercury occur where concentrations are greater than three microg/l. Organic mercury is apparently more harmful, the corresponding concentration being greater than 0.1 microg/l. Aquatic algae and the larval stages of molluscs and crustaceans appeared to be the most sensitive organisms to mercury. The conclusions reached following investigations under controlled conditions in the laboratory do not necessarily apply in the natural environment and this is particularly true for mercury. Probably the most important factor to be considered is the form in which the mercury is present in the environment, since natural processes such as adsorption, precipitation, volatilisation, and complexation are likely to reduce the concentration of 'biologically available' mercury. In addition, antagonistic reactions may reduce its effect. (Deal-EIS)
W80-03683

IN VITRO INHIBITION OF THREE PHOSPHATASES BY MERCURIC CHLORIDE AND THEIR REVERSAL BY CHELATING AGENT EDTA,
D.A.V. Coll., Muzaffarnagar (India). Dept. of Zoology.
K. V. Sastry, and K. Sharma.
Bulletin of Environmental Contamination & Toxicology, Vol 23, p 741-746, 1979. 2 Tab, 23 Ref.

Descriptors: *Enzymes, *Inhibition, *Mercury, Phosphates, Organic compounds, Biochemistry, Proteins, Fish physiology, Animal metabolism, Heavy metals, Chelation, *EDTA, *Channa, *Tissue analysis.

In vitro studies revealed that mercury is quite effective in inhibiting the activities of three Channa punctatus brain enzymes (alkaline phosphatase, acid phosphatase, glucose-6-phosphatase). The degree of inhibition is directly proportional to the increase in the concentration of mercuric chloride in the culture medium. EDTA was found to be capable of restoring the activity of all three enzymes. The degree of restoration increased with the increase in EDTA concentration and time. (Deal-EIS)

THE EFFECTS OF THE ANAESTHETIC QUINALDINE ON OXYGEN CONSUMPTION IN AN INTERTIDAL TELEOST BLENNIUS PHOLIS (L.),
Plymouth Polytechnic (England) School of Environmental Sciences.
R. N. Dixon, and P. Milton.
Journal of Fish Biology, Vol 12, p 359-369, 1978. 3 Fig, 7 Tab, 32 Ref.

Descriptors: *Oxygen requirements, *Fish physiology, *Inhibition, *Organic compounds, Teleosts, Chemical properties, Mode of action, Respiration, Water chemistry, Animal metabolism, Marine fish, *Anaesthetics, *Quinaldine, *Blennius, Blennies.

The effects of the anaesthetic quinaldine on oxygen consumption in an intertidal teleost Blennius pholis (L) were investigated. Oxygen consumption generally decreases with increasing quinaldine concentration in environmental water. However, at low concentrations, oxygen consumption of smaller specimens is slightly increased. Generally, smaller specimens have their oxygen consumption affected less by a given quinaldine concentration than do larger specimens, as the former appear to be at less depressed stages of anaesthesia. This is thought to be due to smaller B. pholis becoming saturated with quinaldine more rapidly but simultaneously being afforded more rapid removal, because of their greater relative gill area per unit body volume. The reduction of oxygen consumption at high concentrations of quinaldine is great. (Deal-EIS)

THE FIELD ASSESSMENT OF EFFECTS OF DUMPING WASTES AT SEA: 3. A SURVEY OF THE SEWAGE SLUDGE DISPOSAL AREA IN LYME BAY,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Directrorate of Fisheries Research.
R. A. Eagle, P. A. Hardiman, M. G. Norton, and R. S. Nunny.
Ministry of Agriculture, Fisheries & Food, Directorate of Fisheries Research, Fisheries Research Technical Report No 49, ISSN 0308-5589, Lowestoft, 1978. 22 p, 20 Fig, 3 Tab, 1 App, 30 Ref.

Descriptors: *Sludge disposal, *Heavy metals, *Biological communities, Dominant organisms, Bioindicators, Benthic fauna, Path of pollutants, Sewage disposal, *Mercury, *Copper, *Zinc, *Lead, *Nickel, *Chromium, Nutrients, Nitrogen, Phosphorus, Sewage bacteria, Particle size, Bottom sediments, *Species diversity.

The survey of the area in Lyme Bay used for the dumping of sewage sludge shows dispersion processes to be ineffective in preventing accumulations of dumped material in the sediments. Despite the small quantity of sludge dumped (62,000 m3/year) levels of carbon, nitrogen and trace metals such as mercury, copper, zinc, lead, nickel and chromium are significantly elevated in the area most commonly used for dumping. The addition of organic materials by dumping does not appear to have been utilised by any of the benthic species and there is no evidence of enrichment of numbers of individual species or of the number of species. In the zone most contaminated by dumping, however, there appeared to be a slight reduction in the number of species present, caused by the absence of some of the rarer species found in other parts of the survey area. (Deal-EIS)

EFFECTS OF TEMPERATURE AND SALINITY ON PRODUCTION AND HATCHING OF DORMANT EGGS OF ACARTIA CALIFORNIENSIS (COPEPODA) IN AN OREGON ESTUARY,
Oregon State Univ., Corvallis. School of Oceanography.
J. K. Johnson.
Fishery Bulletin, Vol 77, No 3, p 567-584, 1979. 11 Fig, 3 Tab, 32 Ref.

Descriptors: *Copepods, *Hatching, *Inhibition, *Dormancy, Water temperature, Salinity, Toxicity, Growth stages, Growth rates, Embryonic growth stage, Mortality, Seasonal, Zooplankton, Oregon, Yaquina Bay, Estuaries, *Acartia.

Experimental results indicate that induction of dormancy in Acartia californiensis eggs is temperature dependent and occurs below 15C in two ways: (1) Cold adapted females spawn true resting eggs which exhibit major differences in hatching and survival rates from nondormant eggs under similar conditions. (2) Nondormant eggs spawned above 15C may become dormant and have short-term viability at temperatures below 15C. Salinity does not induce dormancy. Hatching results of field-collected resting eggs at naturally occurring temperature-salinity combinations demonstrate that termination of dormancy is also primarily temperature dependent. Salinity, however, regulates rate and success of hatching. In addition, heavy naupliar mortality occurs following hatching at low salinities. Substantial hatching must occur in the field over much of the year. Since subsequent survival and population growth depends on the presence of favorable temperature and salinity conditions, nauplii which hatch during the low salinity winter and spring months in Yaquina Bay must be lost. This phenomenon is viewed as a 'leaky' population diapause. Resting eggs were also demonstrated for Epilabidocera longipedata and Eurytemora affinis, an occurrence previously undescribed in the literature. (Deal-EIS)

EFFECTS OF DAMS AND IMPOUNDMENTS ON MIGRATIONS OF JUVENILE CHINOOK SALMON AND STEELHEAD FROM THE SNAKE RIVER, 1966 TO 1975,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
H. L. Raymond.
Transactions of the American Fisheries Society, Vol 108, p 505-529, 1979. 7 Fig, 13 Tab, 23 Ref.

Descriptors: *Fish migrations, *Fish barriers, *Columbia River, Chinook salmon, Rainbow trout, Dams, Impoundments, Juvenile growth stage, Mortality, Entrainment, Fish populations, Rivers, Flow rates, Steelhead trout, Pacific salmon, *Snake River.

Migrations of juvenile chinook salmon, Oncorhynchus tshawytscha, and steelhead, Salmo gairdneri, from tributaries of the Snake River were monitored as far downstream as The Dalles Dam on the Columbia River in most years during the period 1966 to 1975. New dams constructed on the Snake River adversely affected survival and delayed migrations of juveniles. Significant losses of juveniles in 1972 and 1973 were directly responsible for record-low returns of adults to the Snake River in 1974 and 1975. Major causes of mortality were passage through turbines at dams, predation, and delays in migration through reservoirs in low-flow years, and prolonged exposure to lethal concentrations of dissolved gases caused by spilling at dams during high-flow years. Migrations of juvenile steelhead were generally later than those of chinook salmon and generally coincided with maximum river discharge. Lack of river runoff in 1973 caused a significant number of steelheads to stop migrating and to hold over in reservoirs. Mortality of chinook salmon and steelhead resulting from new dams has differed with respect to area and cause. Magnitude and composition of seaward migration has changed from 3 to 5 million wild fish in the mid-1960's to 8 to 10 million fish of both wild and hatchery origin in the 1970's. (Deal-EIS)

ROTENONE RESISTANCE OF GOLDEN SHINERS FROM A PERIODICALLY RECLAIMED POND,
Connecticut Dept. of Environmental Protection, Middlebury.
R. D. Orciari.
Transactions of the American Fisheries Society, Vol 108, p 641-645, 1979. 1 Tab, 21 Ref.

Descriptors: *Shiners, *Resistance, *Rotenone, Adaptation, Pesticide toxicity, Piscicides, Bioassay, Mortality, Fish physiology, Fish populations, Fish management, Connecticut, Ball Pond, *Noxfish(Trade name).

Golden shiners (Notemigonus crysoleucas) generally reinfested Ball Pond, New Fairfield, Connecticut in greater numbers after each of six successive rotenone reclamations carried out from 1957 to 1974. To determine if Ball Pond golden shiners had developed resistance to rotenone, paired bioassays were completed with golden shiners from Ball Pond and from seven comparison ponds. Based on tolerance rations, Ball Pond golden shiners were 4.0-7.1 times more tolerant of synergized and unsynergized formulations of rotenone than were golden shiners from unreclaimed ponds. Fish from Ball Pond were only 2.4 times more tolerant of synergized rotenone than were only 2.4 times more tolerant of synergized rotenone than were golden shiners from a pond reclaimed once with synergized rotenone in 1974. Golden shiners from comparison ponds also succumbed earlier to the effects of both rotenone formulations than did fish from Ball Pond. These findings suggest that Ball Pond golden shiners developed increased resistance to rotenone through the selective forces of reclamation. (Deal-EIS)

DYNAMICS AND BEHAVIORAL TOXICOLOGY OF AQUA-KLEEN (TRADE NAME) (2,4-D BUTOXYETHANOL ESTER) AS REVEALED BY THE MODIFICATION OF RHEOTROPISM IN RAINBOW TROUT,
Waterloo Univ. (Ontario). Dept. of Biology.
J. J. Dodson, and C. I. Mayfield.
Transactions of the American Fisheries Society, Vol 108, p 632-640, 1979. 7 Fig, 1 Tab, 17 Ref.

Descriptors: *2,4-D, *Pesticide toxicity, *Rainbow trout, *Rheotropism, Fish physiology, Animal metabolism, Pesticide kinetics, Herbicides, Chlorinated hydrocarbon pesticides, Fish behavior, Lethal limit, Pesticide residues, Bioassay, *Aqua-Kleen(Trade Name).

The rheotropic response of rainbow trout (Salmo gairdneri) to a water current, simulated by a striped background moving past the fish, was observed following 24-hour exposures to field application concentrations of the aquatic herbicide 2,4-dichlorophenoxyacetic acid (2,4-D) butoxyethanol ester and its commercial formulation Aqua-Kleen (Trade Name). Toxicological modification of rhotropism occurred that would in nature lead to an increased incidence of downstream movement. With increasing concentrations of Aqua-Kleen, the rheotropic response became more variable. As concentrations approached lethal levels, rainbow trout became extremely lethargic and could not avoid capture. Aqua-Kleen was lethal to rainbow trout at concentrations approximately twice the suggested field application level. The ester was taken up rapidly by fish and hydrolyzed to 2,4-D that was secreted back into the water. (Deal-EIS)
W80-03703

THE INFLUENCE OF ACCLIMATION TEMPERATURE ON THE INTERACTIONS OF CHLORINE, ELEVATED TEMPERATURE, AND EXPOSURE DURATION FOR GRASS SHRIMP, PALAEMONETES PUGIO,
Academy of Natural Sciences of Philadelphia, Benedict, MD. Benedict Estuarine Research Lab.
L. W. Hall, Jr., D. T. Burton, and S. L. Margrey.
Transactions of the American Fisheries Society, Vol 108, p 626-631, 1979. 4 Fig, 3 Tab, 25 Ref.

Descriptors: *Water temperature, *Chlorine, *Adaptation, *Shrimp, Chlorination, Heated water, Thermal stress, Powerplants, Toxicity, Mortality, Bioassay, Mathematical models, Animal physiology, *Acclimation.

The effect of 15 and 27C acclimation temperatures on interactions of chlorine, elevated temperature (Delta T), and exposure duration was assessed for the grass shrimp. Test organisms were exposed to total residual chlorine (TRC) concentrations of 0.00, 0.15, and 0.30 mg/liter in combination with Delta T's of 2, 6, and 10C above acclimation temperature and exposure periods of 0.08, 2.0 and 4.0 hours. Chlorine concentrations were decayed over a 1 - 1.5-hour period to D0.01 mg/liter TRC and temperatures were decayed over a 4-hour period to 2C above acclimation. Mortality observations were conducted for 96 hours; however, most of the deaths occurred 36 hours after exposure to the three test variables. A percent mortality model for grass shrimp acclimated to 27C showed (1) the response to chlorine concentration alone and Delta T alone was proportional to the square root of either variable; (2) the exposure duration effect was linear; and (3) no second-order interactions occurred among the variables tested. The model for grass shrimp acclimated to 15C showed (1) Delta T had no effect; (2) the response to chlorine concentration was the dominant factor; and (3) there existed a two-way linear interaction between chlorine concentration and exposure duration. (Deal-EIS)

SEMICONTINUOUS OUTDOOR CULTIVATION OF SCENEDESMUS ACUTUS IN WASTE WATER,
Ceskoslovenska Akademie Ved, Trebon. Inst. of Microbiology.
K. Livansky, K. Veber, and B. Prokes.
Acta Hydrochimica et Hydrobiologica, Vol 7, No 4, p 369-378, 1979. 6 Fig, 6 Tab, 8 Ref.

Descriptors: *Scenedesmus, *Waste water treatment, *Microbial degradation, Chlorophyta, Aquatic algae, Sewage treatment, Farm wastes, Domestic wastes, Productivity, Biomass, Nutrients, Phosphorus, Nitrogen, Growth rates, Aquiculture.

The algae were cultivated in an outdoor cultivation unit in waste water from a sewage treatment plant processing city sewage and largescale hoggery effluent. The cultivation area (2 sq m) had a slant of 3% and the suspension layer thickness was about 5 cm. The total suspension volume in the cultivation device was 150 l. Mass balance served us for derivation of formulas for the average rate of algal biomass production and for the extent of nutrient removal from waste water. Experiments showed a considerable effect of dilution rate on individual parameters in these formulas. The removal of nitrogen and phosphorus is optimal at a dilution rate of 0.3/day whereas optimum biomass production lies at about 0.1/day. The nitrogen and phosphorus yield coefficient Y (g biomass/g element) are practically identical, both of them depending on dilution rate. The effect of the dilution rate on other characteristics of the effluent water has not yet been unambiguously proved. The results of bacteriological and mycological examinations and of the chemical analysis of resulting algal biomass are presented. (Deal-EIS)

W80-03705

STUDIES ON THE EFFECTS OF ACIDIC MEDIUM ON THE FRY OF CYPRINUS CARPIO,
Holkar Science Coll., Indore (India). Dept. of Zoology.
R. S. Shrivastava, and P. Dwivedi.
Acta Hydrochimica et hydrobiologica, Vol 7, No 4, p 421-430, 1979. 6 Fig, 1 Tab, 20 Ref.

Descriptors: *Acids, *Toxicity, *Fry, *Carp, Fish eggs, Growth stages, Animal growth, Hatching, Cytological studies, Biological membranes, Mode of action, Bioassay, Lethal limit, Chemical wastes, Industrial wastes, Hydrochloric acid, *Teratogens.

The effects of acidic medium on the fry of Cyprinus carpio have been studied. The eggs were put in various concentrations of HCl ranging from 0.0025 ppm to 0.0500 ppm. One specimen from each experimental group was sacrificed for histological studies every week. It was found that when the fry were kept in the acidic medium the following changes took place. The nucleus became inconspicuous and the cell wall became disorganised. The muscle layers of gut wall became indistinct and disorganised to some extent. The epithelial lining of the gut was partially destroyed. Vacuolation in the connective tissue of gut was seen due to destruction of some of the cells. Hepatic cells of the liver were destroyed at various spots to a varying degree. A comparative study of results showed that the percentage of hatching is inversely proportional to the strength of pollutant (HCl). The LD-50 period of fry is inversely related to the strength of HCl in ppm. (Deal-EIS)

MUTAGENICITY OF FLUORENE DERIVATIVES: A PROPOSED MECHANISM,
Massachusetts Univ., Amherst. Dept. of Botany.
D. E. Levin, W. S. Barnes, and E. Klekowski.
Mutation Research Vol 63; p 1-10 1979. 3 Fig, 2 Tab, 27 Ref. OWRT B-053-MASS (6).

Descriptors: *Mutagens, *Fluorene derivatives, *Salmonella, Water pollution, Pollutant identification.

Several derivatives of fluorene, a tricyclic, organic molecule, have been found to induce both frameshift mutations and base-pair substitutions in Salmonella typhimurium strains developed by Ames. Comparisons of the mutagenic potency of these derivatives for several strains of Salmonella suggest the importance of a carbonyl group substituted at the carbon-9 position of mutagenic derivatives, with respect to mutagenic potency. In this study, a feasible mechanism for the interaction of mutagenic fluorene derivatives with deoxyribonucleic acid is presented. This mechanism requres the interaction of the mutagenic molecule with carbon-8 of guanine and a second concurrent interaction with the C-4 amino group of an adjacent cytosine residue. (Godfrey-Mass)

MUTAGENS IN A RIVER HEAVILY POLLUTED WITH PAPER RECYCLING WASTES: RESULTS OF FIELD AND LABORATORY MUTAGEN ASSAYS,
Massachusetts Univ., Amherst. Dept. of Botany.
E. Klekowski, and D. E. Levin.
Environmental Mutagenesis Vol 1; p 209-219, 1979. 3 Tab, 19 Ref. OWRT B-053-MASS (7).

Descriptors: *Paper recycling, *Mutagens, *Water pollution, *Industrial wastes, *Pulp and paper industry, Environmental effects, Biota, Ecotypes, Pollutant identification.

A natural population of the fern Osmunda regalis growing in a river heavily polluted with paper recycling wastes had a high incidence of chromosome mutations. This population was monitored for four years for the frequency of two-break chromosome mutations. These mutations were postzygotic in origin and suggested the presence of mutagens in the river water. The fern population is downstream from the outfalls of a paper recycling mill, which was discharging 13.3 X 10 to the 6th power liters of untreated paper recycling waste per day. In 1977 a waste-water-treatment facility was constructed to remove the solid waste previously discharged into the river. This facility generates 69,300 kg of solid waste daily, which is taken to a landfill. Periodic samples of this solid waste were collected from the waste-treatment facility in the summer of 1978, extracted with various solvents, and the extracts tested for mutagenic activity with the Salmonella/mammalian microsome mutagenicity test (Ames et al, 1975). A majority of the solid waste samples contained mutagenic materials, but in all cases S-9 activation was required for mutagenic activity. The samples also were assayed with the soybean mitotic crossing-over assay (Vig, 1975). Four out of six samples were positive. These results document the presence of mutagens in the solids waste generated by a paper recycling industry and the genetic impact of these mutagens on the local biota. (Godfrey-Mass)

AN EMPIRICAL MODEL FOR PHYSICAL PARAMETERS OF RECENT SEDIMENTARY DEPOSITS OF LAKE EKOLN AND LAKE VANERN,
National Swedish Protection Board, Uppsala.
L. Hakanson.
Vatten, Vol 33, No 3, p 266-289, 1977. 27 Fig, 5 Tab, 33 Ref.

Descriptors: *Sediments, *Sedimentation, *Lake Ekoln, Sweden, *Interstitial water, *Lake Vanern, Sweden, Organic matter, Density, Depth, Particle size, Fetch, Equations, Erosion, Erosion rates, Lake beds, Curves, Correlation analysis, Compaction, Sedimentation rates.

In Lakes Ekoln and Vanern, Sweden, the internal physical sediment status of the biologically active sediment layer, indicated by water content, organic content, bulk density, inorganic matter density, grain size, sediment compaction and sediment depth, can be described by general empirical equations. Furthermore, the model shows that water content correlates with all internal variables. Internal sediment status also correlates with external governing parameters such as effective fetch, water depth, slope and distance from river mouth. This indicates that the bottom dynamic situation may be determined before sediment samples have been collected. This approach makes it possible to predict areal distribution of erosion, transportation and accumulation zones. Sediment samples must be collected to establish the physical status of accumulation bottom sediments. After empirical constants are determined, the gross variation of all internal sediment parameters throughout the active layer within accumulation zones may be calculated. Lakes Ekoln and Vanern differ significantly in terms of size, trophic status, bottom fauna and alloctonous influence. Lake Ekoln has 19 sq km area, 38.3 m maximum depth and is eutrophic. Lake Vanern has 5,650 sq km area, 106 m maximum depth and is oligotrophic. Work focuses on biologically active deposits within accumulation zones. (Danovich-Wisconsin)

VERY SIMPLE MODEL OF THE INITIAL STAGE OF OLIGOTROPHIC-EUTROPHIC SUCCESSION. IN BODIES OF WATER,
Moscow State Univ., (USSR).
V. V. Alekseev, and M. S. Polyakova.
The Soviet Journal of Ecology, Vol 9, No 1, p 1-5, January-February, 1978, 2 Fig, 5 Ref. Translated from Ekologiya, No 1, p 5-10, January-February, 1978.

Descriptors: *Succession, *Mathematical models, *Ecosystems, *Speication, Eutrophication, Oligotrophy, Biological communities, Biomass, Nutrients, Nitrogen, Phosphorus, Equations, Kinetics, Nutrient loading, Trophic level, Invasion, Food abundance, Food chains, Foods, Competition.

A succession process model in oligotrophic water bodies shows that increasing total mass of system-limiting biogenic elements increases the number of species. However, the maximal number of species in the climatic community differs; it is maximal when consumers are mainly specialized for a particular diet. If the character of trophic connections between species is known, matter circulation schemes can be compiled in certain limiting ecosystems containing all these species. Ecosystems biomass increase rates are determined by biogenic elements present in the ecologic minimum. In water ecosystems these biogenic elements are usually nitrogen or phosphorus. Dynamic model variables are ecosystem component masses such as species biomass. The model consists of differential equations describing ecosystem kinetics. It can predict tendencies taking place during natural or artificial species introduction. On introduction, one specie may be supplanted by another. Adaptation to abiotic environmental factors is exceptionally important for the immigrant species survival; however, the immigrant's biotic environment, principally food reserves and enemies, are also important to attain high abundance. The model predicts a given species ability to survive approximately, if trophic system connections between species and quantitative estimates of these connections are known. (Danovich-Wisconsin)

BODY SIZE AND FEEDING ECOLOGY AS ALTERNATIVES TO TAXONOMY FOR THE STUDY OF LIMNETIC ZOOPLANKTON COMMUNITY STRUCTURE,
Erindale Coll., (Ontario). Dept. of Zoology.
W. G. Sprules, and L. B. Holtby.
Journal of the Fisheries Research Board of Canada, Vol 36, No 11, p 1354-1363, November 1979. 1 Fig, 7 Tab, 51 Ref.

Descriptors: *Zooplankton, *Systematics, *Biological communities, *Size, *Food habits, *Ecotypes, Lakes, Bruce Peninsula, Ontario, Energy, Energy transfer, Food webs, Ecology, Ecosystems, Regression analysis, Correlation analysis, Dominant organisms, Food chains, Southeast Asia, Sri Lanka, Tropical regions, Canada.

Analysis of methods for characterizing limnetic zooplankton community structure in 44 water bodies of Bruce Peninsula, Ontario July and August 1975 show that in comparison with taxonomy, ecological and image analysis characterization reflect zooplankton community features better in terms of efficiency and energy flow. While patterns in taxonomic community structure are of interest, characterizations of zooplankton associations on the basis of body size and feeding ecology are of greater use because (1) they more closely reflect zooplankton community features which are related to efficiency and energy flow through pelagic ecosystems; (2) emphasis of simpler, more ecologically significant size characteristics results in stronger relations to lake limnological features; (3) they provide more informative comparisons of plankton communities from disparate zoogeographic regions; and (4) they require less money, expertise and time in community data acquisition. Excepting major equipment capital costs and presuming access to an image analyzer, individual sample processing time for image analysis is 25% that for ecological analysis which is 33% that for taxonomic analysis. Furthermore, body size-feeding ecology analysis or image analysis zooplankton associations more strongly correlate statistically to lake morphometric and hydrological properties. Body size-feeding ecology characterizations also provide more useful functional insights than taxonomically based ones when comparing zooplankton communities from Bruce Peninsula, Ontario and southeast Asia, particularly Sri Lanka. RIVER-QUALITY ASSESSMENTS.
Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. American Water Resources Association, St Anthony Falls Hydraulic Laboratory, Minneapolis, Minnesota, 1978. 190 p, Greeson, P.E., Editor.

Descriptors: *Water quality, *River basins, *Conferences, *Oregon, *Georgia, *Colorado, *Wyoming, *On-site investigations, Water resources, Water pollution, Water management(Applied), Water quality control, Low-flow augmentation, Water treatment, Water pollution sources, Erosion, Water properties, Dissolved oxygen, Biochemical oxygen demand, Thermal water, Model studies, Rivers, Watersheds(Basins), *Willamette River Basin(OR), *Chattahoochee River Basin(GA), *Yampa River Basin(CO), Secondary treatment, River-quality assessments, Pilot studies.

River-quality assessments were made during pilot studies on the Willamette River basin in Oregon, the Chattahoochee River basin in Georgia, and the Yampa River basin in Colorado and Wyoming. The ten papers presented at the symposium reported on these pilot studies in the broad subject areas of Concepts of River-Quality Assessments and Selected Methods for Addressing River-Quality Problems. AN INTERIM REPORT ON THE INTENSIVE RIVER-QUALITY ASSESSMENT OF THE UPPER CHATTAHOOCHEE RIVER BASIN, GEORGIA,
Geological Survey, Doraville, GA.
R. N. Cherry, R. E. Faye, J. K. Stamer, and R. L. Kleckner.
In: River-Quality Assessments; Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. p 22-42, 1978. 15 Fig, 4 Tab, 2 Ref.

Descriptors: *Water quality, *River basins, *Georgia, *On-site investigations, Water pollution sources, Urbanization, Pollutants, Water pollution, River regulation, Data collections, Biological communities, Water utilization, Dissolved solids, Dissolved oxygen, Water temperature, Phytoplankton, Algae, Sediments, Discharge(Water), Land use, Thermal water, Water supply, Hydroelectric power, Hydrology, *Chattahoochee River Basin(GA), River-quality assessment.

The purpose of this report was to present a general description of the area, present and future water uses in the basin, and findings of the study relating to water-quality problems. Urbanization and hydropower releases have a pronounced effect on the quality of the waters of the Chattahoochee River. Loads of total and dissolved constituents increase exponentially with increases in urbanization within the basin. Urban point and nonpoint waste sources contribute most of the dissolved solids and large amounts of the suspended loads to the river. Annually, point sources contribute about 53% of the total phosphorus and 47% of the total nitrogen loads determined at a station 30 miles downstream of Atlanta. Nonpoint sources contributed 78% of the dissolved solids and 72 to 89% of the heavy metal load. Point source discharges of carbonaceous and nitrogenous loads contribute about equally to low dissolved oxygen concentrations (4.6 mg/l) in the river during low flow. Heat loads from thermoelectric generating facilities increase the rate at which the dissolved oxygen in the river is depleted. Hydropower releases and regulation of flows from Buford Dam and Morgan Falls reduce the frequency and magnitude of high and low flows of the river. During low flow periods the net effect of the regulated flow is to cool the waters of the Chattahoochee River and dilute the waste discharges from urban areas. Sediment yields in the basin are primarily a function of drainage area, rainfall, and land use. (See also W80-03606) (Humphreys-ISWS)

TOWARD A CONCEPTUAL FRAMEWORK FOR RIVER-QUALITY TREND AND CAUSE-EFFECT ANALYSIS,
URS Co., Seattle, WA.
W. G. Hines, and D. A. Rickert.
In: River-Quality Assessments; Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. p 65-72, 1978. 2 Fig, 1 Tab, 7 Ref.

Descriptors: *Water quality, *Monitoring, *Rivers, *Hydrologic aspects, Water pollution, Planning, Management, Analysis, Streamflow, Water temperature, Channel morphology, Salinity, Toxicity, Algae, Dissolved oxygen, Water sampling, Analytical techniques, Methodology.

River-quality planning and management programs have been hampered by a general inability to analyze and document pollution trends and cause-effect relations. River-quality data programs historically have been based on routine monitoring approaches that provide poor capability for separating those quality variations caused by the natural hydrologic regimen from those caused by pollution loads. An outline for a new conceptual framework was proposed as a basis for improving the interpretive utility of river-quality data programs. The framework is based on (1) a hydrologic analysis focusing on streamflow and water temperature patterns and channel morphology characteristics, (2) the use of a multiple steady-state concept to 'keep track' of seasonal quality variations and to provide a guide for the timing of (3) intensive, synoptic sampling studies (in lieu of routine monitoring) made during the most critical times and pollution-prone river reaches. Viewed from the broadest perspective, a commitment to the program outlined would involve a shift to a flexible, opportunistic approach, and away from a rigidly structured routine approach. Importantly, however, the results from many different river systems would be bound by the common conceptual framework offered by the consideration of river hydrology and its intimate relation to the temporal and spatial form of each river-quality process and problem. ALGAL GROWTH POTENTIAL--LOWER WILLAMETTE RIVER, OREGON,
Portland State Univ., OR. Dept. of Biology.
R. Petersen.
In: River-Quality Assessments; Proceedings of a Symposium held in Tucson, Arizona, November 2-3, 1977. p 101-124, 1978. 14 Fig, 1 Tab, 36 Ref.

Descriptors: *Water quality, *Aquatic life, *Rivers, *Oregon, Ecosystems, On-site investigation, On-site data collections, Aquatic environment, Phytoplankton, Nutrients, Diatoms, Plankton, Primary productivity, Silica, Nitrates, Nitrogen, Phosphorus, Water sampling, Laboratory tests, Spatial distribution, Temporal distribution, Dissolved oxygen, Algae, *Willamette River(OR).

The growth of planktonic algae was investigated in the lower reaches of the Willamette River during 1973 and 1974. Primary productivity was not high, and the dominant species observed were diatoms. Orthophosphate, silica, and nitrate plus ammonia were present in concentrations well above levels that are considered limiting to algal growth. High inorganic turbidity and a relatively deep mixed layer evidently limited algal growth in the lower reaches of the Willamette River. (See also W80-03606) (Humphreys-ISWS).

TRACE ELEMENT LOADING OF SOUTHERN LAKE MICHIGAN BY DRY DEPOSITION OF ATMOSPHERIC AEROSOL,
Governors State Univ., Park Forest South, IL. Coll. of Environmental and Applied Sciences.
D. A. Dolske, and H. Sievering.
Water, Air, and Soil Pollution, Vol 12, No 4, p 485-502, November 1979. 2 Fig, 9 Tab, 29 Ref. EPA R00530101.

Descriptors: *Trace elements, *Lake Michigan, *Aerosols, *Water pollution sources, Metals, Chemicals, Sampling, Monitoring, Chemical analysis, Air pollution, Water pollution, Winds, Air temperature, Water temperature, Currents(Water), Pollutants, Path of pollutants.

Aerosol samples and meteorological data were collected at a mid-southern Lake Michigan site (87 deg 00 min W, 42 deg 00 min N) from May through September 1977. Hi-volume samplers with cellulose fiber filters and a digital meteorological data recording system were operated on board the U.S. EPA's R/V Roger R. Simons during four intensive sampling periods. Aerosol samples were analyzed by atomic absorption spectroscopy for seventeen trace elements. A diabatic drag coefficient method was used to determine aerosol deposition velocity (nu sub d) overlake. A mean nu sub d of 0.5 cm/s was found for the aerosol diameters between 0.1 and 2.0 micrometers. By relating the observed trace element concentrations and nu sub d to a long-term climatological record, annual dry deposition loadings to the southern basin for nine elements were estimated. For four elements, Fe, Mn, Pb, and Zn, dry deposition loadings to the southern basin alone of at least 500000, 30000, 250000, and 100000 kg/yr were found. For Fe and Mn, these loadings represent about 15% of the total of all inputs to Lake Michigan. For Zn and Pb, about one-third to one-half of the annual loading from all sources is from dry deposition of atmospheric aerosol. (Sims-ISWS)
W80-03621

ON THE VALUE OF SOIL COLUMNS FOR ASSESSING THE TRANSPORT PATTERN OF VIRUSES THROUGH SOILS: A CRITICAL OUTLOOK,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
G. Bitton, J. M. Davidson, and S. R. Farrah.
Water, Air, and Soil Pollution, Vol 12, No 4, p

449-457, November 1979. 2 Tab, 30 Ref.

Descriptors: *Soils, *Viruses, *Path of pollutants, *Waste disposal, Effluents, Sewage effluents, Sewage sludge, Pollutants, Water pollution, Soil contamination, Soil water, Groundwater, Soil water movement, Laboratory tests, On-site investigations, Monitoring, Reviews.

The U.S. Water Pollution Control Act Amendment of 1972 (PL 92-500) has made land disposal of wastewater effluents and residuals a viable and attractive alternative. Land spreading of wastewater effluents and residuals has many advantages, including the addition of plant nutrients, water conservation, improvement of soil physical properties, and increased soil organic matter. Public health risks associated with land disposal of wastes containing human pathogens can be assessed only through a thorough examination of the survival and transport pattern of these pathogens through soils. This topic has been thoroughly covered in recent reviews. In this review, the authors were primarily concerned with a critical examination of the various methods frequently used to assess soils' potential to retain viruses. Knowledge concerning the transport pattern of viruses through soils can be gained through field monitoring of these infectious particles in wastewater effluents, sludges, soils and groundwater, and/or through soil column experiments. The latter have been criticized, and our purpose was to examine these criticisms and suggest, if necessary, some alternate solutions. Furthermore, the authors reviewed the practical information gained through soil column studies and examined, with the aid of examples of land application sites across the country, the relationship between laboratory and field studies. INCIDENTS OF ELEVATED NITRATE IN SOUTHERN ONTARIO,
Ontario Ministry of the Environment, Toronto (Ontario).
K. C. Heidorn.
Water, Air, and Soil Pollution, Vol 12, No 4, p 417-429, November 1979. 11 Fig, 2 Tab, 19 Ref.

Descriptors: *Nitrates, *Air pollution, *Path of pollutants, *Canada, *Great Lakes, Water pollution sources, Nutrients, Acids, Nitrogen compounds, Weather, Winds, Meteorology, *Ontario.

A study of nitrate in suspended particulate in the lower Great Lakes region of southern Ontario, Canada, during the period 1976-1977 has indicated that elevated levels (in excess of 9.9 micrograms/cu m) occur simultaneously across the region on certain days. These days most frequently fall within the cold-season months of October to March. The most common weather situation on these days is the presence of an anticyclone over or to the east of southern Ontario. Case studies of three periods in early 1977 during which widespread elevated nitrates occurred showed nitrate levels to be dependent upon the previous history of the air mass. When back trajectories showed that the air mass had previously moved across the lower Great Lakes, nitrate levels were high. Low nitrate levels were most common when the air mass had moved across the upper Great Lakes. The low variability of nitrate concentration among the monitoring network and similar history of air mass movement indicates that long range transport is, in part, responsible for elevated ambient nitrate levels. CONTRIBUTIONS OF URBAN LAND USE TO STREAM WATER QUALITY,
Delaware Univ., Newark. Dept. of Civil Engineering.
D. L. Davis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-151178, Price codes: A08 in paper copy, A01 in microfiche. MS Thesis, 1979, 139 p, 80 Ref. OWRT B-018-DEL(2), 14-34-0001-8070.

Descriptors: *Urban runoff, *Path of pollutants, *Lead, Cadmium, Streams, Inflow, Surface runoff, Storm water, Delaware, *Christiana River(Del).

The impact of urban runoff on stream water quality with respect to cadmium and lead in both the particulate and liquid phase, was examined for the Christiana River in the Newark, Delaware area. Five stations were selected, each depicting a different degree of urbanization. Measured concentrations were correlated with stream volumetric flow rates so that storm discharge values could be calculated. Four complete storm events were sampled at appropriate time intervals with results indicating that lead pollution originated from surface stormwater runoff. Rainwater pH demonstrated a temporal variation within a storm event such that increasing pH during a storm controlled the liquid or solid phase concentrations of lead, but cadmium concentrations did not appear to exceed any possible solubility of pH-controlled precipitates. Stream sediment examination indicated primarily that lead was associated with the sediment solids while cadmium remained soluble. Analysis of stream sediments and soils at the sampling stations indicated that these solids, suspended during storm events possess significant adsorption capacity. Modeling efforts with the resulting data indicate the hydraulic dispersion and stochastic models were most appropriate for describing the stream response to storm events.

Data are presented on the uptake of 32p by the Black Sea alga Cystoseira barbata in the presence of compounds with one (phenol), two (hydroquinone) and three (fluoroglucin) hydroxy groups. Phenol and hydroquinone stimulate the uptake of 32p in sea water. Fluroglucin first inhibits its uptake, then later stimulates it. The uptake of 65Zn in the presence of hydrogen sulfide was likewise inhibited initially, but later facilitated. (Deal-EIS)

Hydrobiological Journal, Vol 14, No 3, p 68-73, 1978. 4 Fig, 1 Tab, 15 Ref.

Descriptors: *Rooted aquatic plants, *Absorption, *DDT, Pesticide kinetics, Pesticide toxicity, DDD, DDE, Chlorinated hydrocarbon pesticides, Root systems, Plant physiology, Tracers, Radiochemical analysis, Marsh plants, *Bioaccumulation, *Tissue analysis.

Pondweed and reeds absorb and accumulate significant quantities of DDT. The stability of the mechanism by which pondweed absorbs this pesticide--which we can judge by considering changes in the curves which represent the absorption of DDT-14C as a function of concentration and exposure time--enable us to postulate that this plant has no active mechanism for regulating DDT absorption. Its accumulation of the insecticide is governed by the latter's concentration and by the time the plant is exposed to it; absorption continues until it kills the plant. In reeds, an active protective mechanism was found which responds to high concentrations of DDT in the environment. This mechanism takes the form of an accumulation of large quantities of DDT by the root system so that large quantities of DDT do not reach the stems and leaves. Changes in the ratios of DDT, DDD and DDE in the water, roots and leaves indicate that partial dechlorination of the pesticide occurs in growing reeds. This suggests that reeds play a substantial role in the processes by which bodies of water cleanse themselves of DDT residues. (Deal-EIS)

IDENTIFICATION OF ORGANIC SULFUR COMPOUNDS TRANSFERRED TO FISH FROM PETROLEUM SUSPENSION BY MASS CHROMATOGRAPHY,
Okayama Univ. (Japan). Dept. of Public Hygiene.
M. Ogata, and Y. Miyake.
Water Research, Vol 13, p 1179-1185, 1979. 4 Fig, 1 Tab, 7 Ref.

Descriptors: *Pollutant identification, *Oil pollution, *Eels, Sulfur compounds, Chemical analysis, Oil, Gas chromatography, Mass spectrometry, Organic compounds, Path of pollutants, Chemical properties, Monitoring, *Tissue analysis, *Crude oil, *Naphthalenes, *Benzothiophenes, *Dibenzothiophenes.

The authors attempted to select organic sulfur compounds usually contained in crude oil as markers of oil pollution in fish. To confirm this, eels (Anguilla japonica) were maintained in a controlled laboratory environment in water with suspensions of crude oil. Gas chromatography-mass spectrometry and mass chromatography of eel flesh extract showed the presence of organic sulfur compounds of alkyl-(from mono- to pentamethyl) benzothiophenes, dibenzothiophene and alkyl-(from mono- to trimethyl) dibenzothiophene and of other organic sulfur compounds of alkyl-(from mono- to pentamethyl) naphthalene. Alkyl benzothiophenes or alkyl dibenzothiophenes of lower carbon numbers were more easily transferred to eel than those of higher carbon numbers. (Deal-EIS)

EXTRACTION AND ACCUMULATION OF 210PB BY AQUATIC ORGANISMS IN LAKES,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
R. F. Dusauskene-Duz, and G. G. Polikarpov.
Hydrobiological Journal, Vol 14, No 3, p 62-67, 1978. 1 Fig, 7 Tab, 17 Ref.

Descriptors: *Lead radioisotopes, *Absorption, *Aquatic algae, *Aquatic plants, Lead, Heavy metals, Radioecology, Radiochemical analysis, Tracers, Lakes, Plant physiology, Metabolism, Path of pollutants, *Tissue analysis, *Bioaccumulation, *Chara, Potamogeton.

Studies of four lakes with different natural thermal profiles showed that the concentration of Pb-210 in the water is independent of depth, and averages 0.26 picocuries per liter. Algae accumulate Pb-210 more actively and in larger amounts than do macrophytes. The accumulation coefficients (AC) are 650 and 300, respectively. The alga with the highest AC (1600) for this radioisotope is Chara contraria. Among macrophytes the highest AC (430) is found in a group of Potamogetonaceae. Extraction of 210Pb from water depends on the plants' absorption capacity and biomass. (Deal-EIS)

IMPACT OF NUTRIENT ENRICHMENT IN A WATERCHESTNUT ECOSYSTEM AT TAKAHAMA-IRI BAY OF LAKE KASUMIGAURA, JAPAN, II ROLE OF WATERCHESTNUT IN PRIMARY PRODUCTIVITY AND NUTRIENT UPTAKE,
Tsukuba Univ., Sakuramura Ibaraki (Japan). Inst. of Biological Sciences.
T. Tsuchiya, and H. Iwaki.
Water, Air, and Soil Pollution, Vol 12, p 503-510, 1979. 3 Fig, 1 Tab, 10 Ref.

Descriptors: *Plant physiology, *Nutrients, *Photosynthesis, Primary productivity, Trophic level, Eutrophication, Lakes, Aquatic plants, Rooted aquatic plants, Root systems, Growth rates, Inhibition, Cyanophyta, Metabolism, *Waterchestnut, *Trapa.

Waterchestnut was shown to be one of the most efficient agents to yield photosynthetic products among aquatic plants in littoral vegetation. Though the plant can be an agent to remove nutrients in agricultural and domestic wastes directly through its waterroots to some extent, waterchestnut plays a great role in removing nutrients through its roots from lake sediments to water-column of the lake. Waterchestnut can be choked to death when its leaves are covered completely by the heavy blue-green algal bloom typical in hypereutrophic lakes. (Deal-EIS)

MERCURY CIRCULATION IN AQUATIC ENVIRONMENT. PART 2: METABOLISM OF METHYL AND PHENYL MERCURY IN PHYTOPLANKTON,
Institut Hygieny a Epidemiologie, Prague (Czechoslovakia).
B. Havlik, J. Stary, J. Prasilova, K. Kratzer, and J. Hanusova.
Acta Hydrochimica et Hydrobiologica, Vol 7, No 4, p 401-408, 1979. 6 Fig, 28 Ref.

Descriptors: *Mercury, *Phytoplankton, *Metabolism, Chlorella, Scenedesmus, Cyanophyta, Aquatic algae, Path of pollutants, Radiochemical analysis, Tracers, Absorption, Radioisotopes, *Biotransformation, *Methylmercury, *Bioaccumulation, Inorganic mercury, Detoxification.

The biotransformation of phenyl and methyl mercury chloride was studied in experiments with planktonic algae Chlorella kessleri, Scenedesmus obliquus and blue-green algae Microcystis incerta. To algal cultures cultivated in an inorganic medium the labelled phenyl or methyl mercury hydroxide was added separately in the phase of the logarithmic growth, the resultant concentration being (3.2 times 10 to the minus 7th power). In intervals of 0, 1, 3, 7, 10 and 14 days samples of the algae and medium were analysed for the total amount of mercury and for the presence of phenyl or methyl mercury. It was found that both methyl and phenyl mercury had accumulated very rapidly in the algae and that up to 70% of 203Hg added was present in the algae during the first 72 hours of the experiment. From the 2nd day onwards, however, methyl and phenyl mercury changed rapidly into inorganic mercury so that by the end of the experiment almost all of the mercury present in algae and the medium was in the form of inorganic mercury. TRANSFER OF 14C-TOLUENE FROM MOSQUITO LARVAE TO BLUEGILL SUNFISH,
Aerospace Medical Research Lab., Wright-Patterson AFB, OH.
W. O. Berry, and J. W. Fisher.
Bulletin of Environmental Contamination & Toxicology, Vol 23, p 733-736, 1979. 1 Tab, 6 Ref.

Descriptors: *Food chains, *Path of pollutants, *Sunfishes, *Mosquitoes, Radiochemical analysis, Tracers, Larval growth stage, Fish food organisms, Absorption, Oil, *Toluene, *Bioaccumulation, *Tissue analysis.

Fourth-instar larvae of the mosquito Aedes aegypti were exposed to a toluene-water solution for 3h, then fed to bluegill sunfish under controlled conditions. At selected time periods (1,4,8,24 and 48 hrs) 5 fish were sacrificed and analyzed. With the exception of the stomach and intestine, there was no difference in the concentration of 14C-toluene in the organs of experimental and control fish. The accumulation of toluene in stomach and intestine would be expected as the ingested, toluene-treated larvae pass along the alimentary canal. These results support the contention that bioaccumulation of chemicals within aquatic food chains is insignificant when compared to accumulation directly from water. (Deal-EIS)

MOBILIZATION OF ORGANOCHLORINES FROM FEMALE LIPID TISSUE AND TRANSPLACENTAL TRANSFER TO FETUS IN A HARBOUR PORPOISE (PHOCOENA PHOCOENA) IN A CONTAMINATED AREA,
Nederlands Inst. voor Onderzoek der Zee, Texel.
J. C. Duinker, and M. Th. J. Hillebrand.
Bulletin of Environmental Contamination & Toxicology, Vol 23, p 728-732, 1979. 1 Fig, 1 Tab, 21 Ref.

Descriptors: *Pesticide residues, *Pesticide kinetics, *Marine animals, Mammals, Polychlorinated biphenyls, DDT, DDD, DDE, Dieldrin, Chlorinated hydrocarbon pesticides, Path of pollutants, Animal physiology, Animal metabolism, *Marine mammals, *Porpoise, *Tissue analysis, *Bioaccumulation, Harbor porpoise, Netherlands.

The fetus of a harbour porpoise from a female stranded on a beach was analyzed for organochlorine content. The highest concentrations of organochlorines are those of PCBs, DDT and dieldrin. The residue concentrations in the fetus are on the same order as the high values detected in adult specimens found dead along the Dutch coast. The results suggest that a significant fraction of the body burden of organochlorines in the female can be transferred to the fetus. (Deal-EIS)

ORGANOCHLORINE, FLUORINE, AND HEAVY-METAL LEVELS IN SOME BIRDS FROM NEW ZEALAND ESTUARIES,
Department of Agriculture, Wellington (New Zealand). Wallaceville Animal Research Center.
J. C. Turner, S. R. B. Solly, J. C. M. Mol-Krijnen, and V. Shanks.
New Zealand Journal of Science, Vol 21, p 99-102, 1978. 1 Tab, 18 Ref.

Descriptors: *Pesticide residues, *Heavy metals, *Fluorine, *Birds, Estuarine environment, Chlorinated hydrocarbon pesticides, DDT, Polychlorinated biphenyls, Dieldrin, Cadmium, Copper, Lead, Zinc, Mercury, *Arsenic, *Selenium, *Tissue analysis, *Bioaccumulation, *New Zealand.

Five species of birds collected from 7 estuarine areas of New Zealand were analysed for organochlorine residues, fluorine, and heavy metals. There were no significant differences in residue levels between the areas studied other than in that of dieldrin, which was detected only in birds from the Auckland and Christchurch estuaries. There were no significant regional differences in bone fluorine. Pukekos had lower levels of organochlorines than the other species. Species differences for fluorine and for some of the heavy metals were probably related to the type of diet. In general the survey indicated little pollution of the environment, even near the most highly industrialized areas of the country. (Deal-EIS)

CHEMOTHERAPEUTICAL STUDIES ON TRIMETHOPRIM AGAINST VIBRIOSIS OF POND-CULTURED AYU--II. TISSUE LEVELS AFTER ADMINISTRATION OF TRIMETHOPRIM-SULFADOXINE MIXTURE (IN JAPANESE),
National Research Inst. of Aquaculture (Japan).
H. Sako, R. Kusuda, and T. Tabata.
Fish Pathology, Vol 14, No 2, p 65-70, 1979. 1 Fig, 2 Tab, 7 Ref.

Descriptors: *Chemical properties, *Bactericides, *Fish diseases, Aquiculture, Chemical analysis, Pesticide kinetics, Pesticide residues, Fish physiology, Animal metabolism, *Tissue analysis, *TMP, *Ayu, *Plecoglossus, Trimethoprim, Fish hatcheries.

The present study was designed to investigate the pharmaco-dynamic properties of trimethoprim (TMP) in ayu, Plecoglossus altivelis, after oral administration of TMP-sulfadoxine (SDX) mixture for the control of vibriosis. The results obtained are summarized as follows: (1) Following a single administration of 30 mg of TMP-SDX(1:5) mixture per kg body weight, the highest tissue levels of TMP were obtained 2 hours after medication in the liver at the level of 10.8 mcg/g, 6 hours in the kidney at the level of 4.4 mcg/g, 2/3 hours in the muscle at the level of 1.8 mcg/g, and 1 hour in the blood at the level of 0.4 mcg/ml. (2) Following daily administration of 30 mg of TMP-SDX (1:5) mixture per kg body weight per day for 10 days, TMP level became undetectably low 24 hours after the last medication in the liver, 48 hours in the kidney and the muscle, and 6 hours in the spleen and the blood. (3) It is concluded that TMP is retained in the tissue for some hours, and is excreted almost completely from the fish within a day. Therefore, it is necessary to administer TMP-SDX mixture to ayu more than once a day to maintain constant tissue levels of TMP. (Deal-EIS)

STAGED MULTIPORT DIFFUSERS,
Texas Univ. at Austin. Dept. of Civil Engineering.
C. W. Almquist, and K. D. Stolzenbach.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY2, Proceedings Paper 15185, p 285-302, February 1980. 10 Fig, 3 Tab, 20 Ref, 2 Append.

Descriptors: *Diffusion, *Waste dilution, *Effluents, Thermal pollution, Pollutants, Entrainment, Jets, Mixing, Model studies, Laboratory tests, Mathematical models, Hydraulics, Coastal engineering, *Diffusers, Staged multiport diffusers.

A staged multiport diffuser was schematized as an equivalent line source of momentum, neglecting the effects of effluent volume and buoyancy fluxes. Centerline effluent concentrations inferred from the predicted volumetric dilution induced by the diffuser discharge were in good agreement with values observed in laboratory scale models of staged diffusers. The theory was found to be applicable to the design of staged diffusers in coastal receiving waters. (Sims-ISWS)

WATER-QUALITY ASSESSMENT OF THE L'ANGUILLE RIVER BASIN, ARKANSAS,
Geological Survey, Little Rock, AR. Water Resources Div.
C. T. Bryant, E. E. Morris, and J. E. Terry.
Available from: OFSS BX 25425, Fed. Ctr. Denver, CO paper copy $21.75 microfiche $3.50. Geological Survey open-file report 79-1482, 1979. 20 p, 22 Fig, 23 Tab, 45 Ref.

Descriptors: *Water quality, *Streams, *Arkansas, *Streamflow, *Channel morphology, Model studies, Surface-groundwater relationships, Effluents, Water analysis, Chemical properties, Physical properties, Biological communities, Water temperature, Sediment discharge, Nutrients, Pesticides, Dissolved oxygen, Data collections.

For several years, dissolved oxygen in the L'Anguille River has been reduced to concentrations of less than 5.0 milligrams per liter during the summer and fall. In addition, concentrations of pesticides have been reported consistently at one long-term station on the river, and trace metals have been reported at two long-term monitoring sites. The U.S. Geological Survey conducted an intensive study of the L'Anguille River basin during the summer and fall of 1978 in cooperation with the Arkansas Department of Pollution Control and Ecology. An assessment of the general water quality was made; the causes of stream dissolved-oxygen reductions were determined; and the occurrence of pesticides and trace metals in the basin was documented. A steady-state, segmented, dissolved-oxygen model was calibrated and used to project simulated dissolved-oxygen profiles. (Kosco-USGS)

THE INFLUENCE OF URBANIZATION OF THE TRANSPORT OF HEAVY METALS IN NEW JERSEY STREAMS,
Rutgers - The State Univ., New Burnswick, N.J. Dept. of Environmental Science.
W. G. Wilber, and J. V. Hunter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153570, Price codes: A07 in paper copy, A01 in microfiche. Water Resources Research Institute, Rutgers University, February 1980. Final technical completion report. OWRT A-050-NJ(5), 14-34-0001-8032.

Descriptors: *Heavy metals, *Water pollution sources, Chemical wastes, Sediment distribution, Sediment yield, Precipitation, Lead, Copper, Zinc, Urbanization, Urban runoff, Storm runoff, Water quality, *Saddle River basin(NJ), *Lodi(NJ), Street sweeping.

A study of the transport of heavy metals was performed on a highly developed 4.6-mile stretch of the Saddle River near Lodi, New Jersey. Heavy metal concentrations in stormwater runoff entering the study area varied significantly throughout runoff events and from storm to storm. Lead, zinc and copper contributed from 90 to 98 percent of the total metals measured. Distribution of metals in precipitation samples collected in the study was similar to that in runoff samples, with lead and zinc predominating, although concentrations of metals in rainfall were much lower than those in runoff. Base flow metal concentrations in tributaties to the Saddle River were variable, with highest levels occurring during wet weather. Metal concentrations in Saddle River sediments also varied; the importance of considering bottom scouring of relatively unconsolidated sediments in the transport of metals in river systems was noted.

PHOSPHRUS EXPORT FROM RURAL MAINE WATERSHEDS,
Maine Univ. at Farmington. Center fro Environmental Research and Education.
D. C. Schroeder.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-153208, Price codes: A03 in paper copy, A01 in microfiche. Land and Resources Center, University of Maine, Orono. Completion Report, December 1979. 46 p, 13 Tab, 6 Fig, 19 Ref, 1 Append.

Descriptors: *Phosphorus, *Maine, *Eutrophication, *Watersheds(Basins), Land use, Nutrients, Lake stages, Surface waters, Aquatic algae, Mathematical models, Hydrology, Seepage, Sediments, Runoff, Non-point sources.

Methods to quantify non-point source contributions of phosphorus from selected watersheds in Maine are examined. Direct measurement approaches to measure stream phosphorus delivery include factors for phosphorus concentrations and discharge both of which vary with time. Direct approaches described are simulatneous measurement, vojume interval measurement, and typical concentration, all of which are weak because they do not provide for the effects of unusual or changing hydrologic conditions. Also these methods do not consider atmospheric fallout and underground seepage. Indirect estimate methods described are land use, soil erosion, and loading by non-stream sources. All of the methods discussed are summarized in a table giving the situations to which they apply, the information they provide, and limitations. In selecting a method for a particular case a user must consider land use, phosphorus forms, source identification, resources, and accuracy. The methods described were tested over a two year period on four drainage basins and their streams in Maine. Conclusions include: (1) stream total phosphorus (TP) is not directly related to discharge but does depend on flow conditions; (2) wading livestock, logging, or construction can cause higher TP concentrations; (3) eroding soil was not a major source of phosphorus; (4) in a normal year an undisturbed basin exported about 0.19kg TP/ha; and (5) TP export control should be aimed at avoiding disturbances in the watershed. Two methods for estimating non-point source phosphorus loads are recommended. (Seigler-IPA)

FLOW IN THE SEA OF HEAVY METALS FROM A SMELTER INDUSTRY,
T. Hellstrom.
Publication No B 518, Swedish Water and Air Pollution Research Institute, Stockholm, October, 1979. 133 p, 51 Fig, 34 Tab.

Descriptors: *Skellefte Bay, Sweden, *Mineral industry, *Heavy metals, *Distribution, *Mathematical models, *Waste water(Pollution), Gulf of Bothnia, Metals, Copper, Lead, Cadmium, Sedimentation, Discharge(Water), Water pollution, Wastes, Ronnskar, Sweden, Leaching, Sediments, Settling velocity, Flocculation, Currents(Water), Sea water.

A mathematical model indicates that one-third of the heavy metals discharged into Skellefte Bay, Sweden, from the Ronnskarsverken smelter industry are leaving the Bay; however, less than 10% of the metals are leaving the total modeled area and flowing into the Gulf of Bothnia. Ronnskarsverken smelter industry in northern Sweden produces copper, lead, zinc, cadmium, gold, silver, selenium and sulfuric acid. This report deals with lead, copper and cadmium in ionic form and total concentrations and their transport from Skellefte Bay to 100 m depth into the Gulf of Bothnia. Atmospheric emissions for lead, copper, and cadmium are 20, 19 and 0.7 tons/mo, respectively, and sea waste water discharges are 1.0, 1.5 and 0.25 ton/mo, respectively. From the Skellefte River, lead, copper and cadmium discharges are 1.5, 2 and 0.04 ton/mo, respectively, originating from mining activities in the catchment area. A metal flow model was developed to predict metal concentrations and sedimentation rates. The model divides the area into 62 surface and bottom boxes. Each box is completely mixed and works as a combined flocculation and sedimentation tank. Processes modeled include current patterns, flocculation, settling and sediment leaching. Half of Skellefte Bay contains metal concentrations considerably higher than background levels. Even though sediment metal concentrations are high, sediment leaching rates are almost negligible in order to explain the free water concentrations. (Danovich-Wisconsin)

CHARACTERISTICS OF EFFLUENTS FROM GRAY AND BLACK WATER SEPTIC TANKS,
Ontario Ministry of the Environment, Ottawa.
M. Brandes.
Journal Water Pollution Control Federation, Vol 50, No 11, p 2547-2559, November 1978. 3 Fig, 6 Tab, 30 Ref.

Descriptors: *Effluents, *Ontario, Canada, *Septic tanks, *Domestic wastes, *Separated sewers, Sludge, Sewage, Phosphorus, Nitrogen, Coliforms, Water quality, Water pollution, Sewage disposal, Waste disposal, Sewage bacteria, Chemical analysis, Detergents, Decomposing organic matter, Excrement.

This project studies chemical and bacteriological effluent characteristics from an Ontario household septic tank where gray water is treated, compared

to effluent from another septic tank at the same house used only for black (toilet) wastewater treatment. Gray water includes discharge from the kitchen sink, tub and shower, bathroom lavatory, dishwasher, and clothes washing machine. Using separate systems extends detention time in the toilet septic tank. Where normal phosphorus containing detergents are used, total and soluble phosphorus in gray water tank effluent is 7.8 and 0.24 mg/l respectively, compared with 1.4 and 0.17 mg/l, respectively, for phosphorus-free detergents. Average total and soluble phosphorus concentrations in black water septic tank effluent is 18.6 and 15.2 mg/l, respectively. Average total Kjeldahl nitrogen concentration in gray septic tank effluent is 11.3 mg/l, 14 times lower than in black (toilet) effluent. Average concentrations of total and suspended solids, BOD, TOC, and COD in black and gray water effluents are the same order of magnitude. Average concentrations of total and fecal coliform organisms in gray water effluent is 240,000/ml and 14,000/ml, respectively. Kitchen wastewater contains large amounts of organic matter that have undergone little breakdown. Required time intervals between gray water septic tank cleanings are 8-10 times longer than cleaning time intervals recommended for normal household septic tanks. (Danovich-Wisconsin)

MICROBIAL IMPACT OF CANADA GEESE (BRANTA CANADENSIS) AND WHISTLING SWANS (CYGNUS COLUMBIANUS COLUMBIANUS) ON AQUATIC ECOSYSTEMS,
Maryland Univ., College Park. Dept. of Microbiology.
D. Hussong, J. M. Damare, R. J. Limpert, W. J. L. Sladen, and R. M. Weiner.
Applied and Environmental Microbiology, Vol 37, No 1, p 14-20, January, 1979. 1 Fig, 2 Tab, 24 Ref. EPA R804206 and R804207.

Descriptors: *Chesapeake Bay, *Canada goose, *Coliforms, *Whistling swan, *Excrement, Microorganisms, Bacteria, Geese(Wild), Migratory birds, Waterfowl, Water birds, Water pollution, Water pollution sources, Enteric bacteria, Pathogenic bacteria, Migration, Migratory patterns, Ecosystems, Environmental effects.

Healthy whistling swans and Canadian geese, migrating along the eastern U.S. Flyway in Chesapeake Bay, do not harbor detectable enteric, bacterial pathogens. Freshly collected fecal matter from caged birds and from autopsied wild swans and geese do not yield Salmonella sp. Furthermore, Salmonella sp was not recovered from the four aquatic roosting sites included in the study. A random selection of 75 E. coli isolates from various waterfowl yields seven enterotoxin-producing E. coli. Waterfowl harboring these enterotoxigenic E. coli are all confined to Lake Shore Pond. Most of the anaerobic bacteria isolated are Escherichia and Streptococcus sp. Wild birds harbor significantly more fecal coliforms that fecal streptococci while the reverse is true for captive and fasting birds. In a 24-h period, a single swan eliminates one billion and a goose 10 million fecal coliforms (FC). At an artificial pond, Lake Shore, 25 captive swans and geese were maintained. Before the birds entered Lake Shore Pond, FC was 1/100 ml and after 220 bird hours, the count rose to 2,400/ml. Despite waste quality deterioration, neither Salmonella nor Shigella were isolated from the water or sediment. At Canninghouse Cove, the largest natural waterfowl roosting site, sediment FC counts rose from 13 to 170 FC/100 ml during the bird season. This sufficiently high population index could result in shell-fishing restrictions. (Danovich-Wisconsin)

PREDICTION OF THE QUALITY OF WATER IN A PROPOSED IMPOUNDMENT IN SOUTHWESTERN WISCONSIN, USA,
Wisconsin Univ.-Madison. Dept. of Soil Science.
D. R. Keeney.
Environmental Geology, Vol 2, No 6, p 341-349, 1978. 4 Fig, 9 Tab, 17 Ref.

Descriptors: *Kickapoo River(WI), *Phosphorus, *Impoundments, *Impounded waters, *Nutrient loading, Nutrients, Nonpoint pollution, Eutrophication, Water quality, Nitrogen, Recreation, Lake La Farge(WI), Base flow, Forecasting, Agricultural runoff, Runoff, Flood control, Decision making, Multiple-purpose reservoirs, Vollenweider models.

Due to large estimates of nutrient loadings and resultant eutrophic water quality is proposed Lake La Farge impoundment on the Kickapoo River, Wisconsin, federal funding was withdrawn from the project. Phosphorus loadings to the impoundment are estimated to be 4.4 g/sq/ m/yr. To reach Vollenweider's permissible levels, P loadings must be 0.2 g/sq m/yr; this cannot be achieved since base flow contributes nearly one-third of total P loading. Runoff supplies a major portion of Nitrogen (39%) and P (30%) to the impoundment. Base flow is also an important nutrient source, providing 35% of N and 32% of P. Recognizable point sources (sewage treatment plants and farmyards) supply 26% and 37% of N and P, respectively. Tertiary sewage treatment for the small communities is difficult to justify economically. Area farms currently practice well-above-average conservation practices, and little improvement in nonpoint nutrient removal would occur without considerable expense. However, in-lake treatment to remove weeds and algae from high-use areas could be done at minimal costs. The large multipurpose impoundment providing flood control and reacreation was first proposed in the 1960s. Construction commenced in 1971-1972 while about 1970-1971 several environmental groups petitioned against completing the impoundment. Major contention involved recreational benefits which assumed water quality good enough for recreational use of the impoundment. (Danovich-Wisconsin)

ADSORPTION-DESORPTION OF DIURON BY FRESHWATER SEDIMENTS,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
D. E. Peck, D. L. Corwin, and W. J. Farmer.
Journal of Environmental Quality, Vol 9, No 1, p 101-106, January-March 1980. 3 Fig, 7 Tab, 18 Ref. (California Water Resources Center Project UCAL-WRC-W-485).

Descriptors: *Adsorption, *Herbicides, *Pesticides, Sediments, Water quality, California, Diuron, Organic carbon, Temperature.

Freshwater sediments were collected from eight different locations in California to study the influence of sediment properties on the adsorption and desorption of the model herbicide, diuron (3-(3,4 dichlorophenyl)-1,1 dimethylurea). The sediments were characterized as to physical and chemical properties using the same methods used for soils. The sediments had a range of organic carbon of 0.91 to 19% and were high in silt and clay. The adsorption of diuron was described by the Freundlich equation. Adsorption at 25C expressed as the Freundlich coefficient, k, was positively correlated to the amount of organic carbon present. There was no correlation with total CEC. The desorption of diuron was evaluated by taking the difference between the slopes of the adsorption and desorption isotherms. As the difference between these slopes increased, less diuron was desorbed. These differences were positively correlated to k and organic carbon. Adsorption at temperatures of 5, 25, and 40C on three sediments indicated that the adsorption of diuron decreased as the temperature increased. (Snyder-California)

THE EFFECTS OF BOTTLE VOLUME, THALLUS WEIGHT, OXYGEN SATURATION LEVELS, AND WATER MOVEMENT ON APPARENT PHOTOSYNTHETIC RATES IN MARINE ALGAE,
California Univ., Irvine.
M. M. Littler.
Aquatic Botany, Vol 7, p 21-34, 1979. 5 Fig, 2 Tab, 30 Ref. (California Water Resources Center Project UCAL-WRC-W-491). OWRT-A-054-CAL(9).

Descriptors: *Marine algae, *Photosynthesis, *Weight, *Volume, *Movement, Photosynthetic oxygen, Aquatic life, Aquatic plants, Photosynthetic rates.

The importance of container volume, thallus weight, O2 tension, and water motion to measurements of photosynthetic rates in Ulva lobata (Kutz.) Setchel and Gardner (a species with a relatively high photosynthetic rate) and Colpomenia sinuosa (Roth) Derb. and Sol. (relatively low photosynthetic rate) were examined by means of O2 changes in bottles and through pH and O2 flux in continuously monitored chambers. The photosynthetic rate of Ulva averaged 36% lower in 310-ml bottles than in 1220-ml jars. Apparent photosynthesis varied as a function of (1) the initial dissolved O2 levels (regardless of bottle size), and (2) the particular metabolic reactions of the individual producers to different O2 tensions. Although similar trends were observed for Colpomenia, the effects of bottle size and initial O2 concentration were not as pronounced as for Ulva. The larger thallus weights of both species resulted in lower photosynthetic values, even in the large containers, due to clumping and self-shading of individual thalli. Mixing had a greater effect on apparent photosynthesis than on dark respiration, and was more critical for Ulva than for Colpomenia. Specific recommendations are put forth to deal with problems arising from the variations in methodology examined. (Snyder-California)
W80-03659

SEASONAL VARIATIONS IN NET PHOTOSYNTHETIC PERFORMANCE AND COVER OF INTERTIDAL MACROPHYTES,
California Univ., Irvine. Dept. of Ecology and Evolutionary Biology.
M. M. Littler, S. N. Murray, and K. E. Arnold.
Aquatic Botany, Vol 7, p 35-46, 1979. 1 Fig, 2 Tab, 32 Ref. (California Water Resources Center Project UCAL-WRC-W-491). OWRT-A-054-CAL(10).

Descriptors: *Macrophytes, *Photosynthesis, *Seasonal, *Fluctuations, *Intertidal areas, Benthos, Aquatic algae, Benthic flora, *Marine algae, Marine plants, Aquatic productivity, *San Clemente Island(Calif).

Standing stocks and net photosynthetic performances were determined concurrently for the 13 most abundant intertidal macrophytes from San Clemente Island, California over a four-season period. Highest net production rates were measured during summer for nine of the 13 species and minimum rates were recorded in spring and to a lesser extent during winter. Correlations between seasonal fluctuations in standing stock and productivity were evident for only eight species. Total daily community production reached a peak in the fall and declined sharply through winter to a spring low, closely paralleling changes in ambient water temperature. Blue-green algae, C. officinalis var. chilensis, P. capillacea, and E. menziesii contributed 76% of the total community primary productivity for the year. Seasonal patterns of photosynthetic performances were highly variable with a tendency for most species to attain peak daily photosynthetic rates coincident with higher temperatures and longer daylength. (Snyder-California)

THE REACTION OF PHRAGMITES COMMUNIS ROOTS TO DDT AND HEXACHLORANE,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
A. I. Merezhko, T. I. Shokod'ko, N. N. Smirnova, and M. B. Dontsov.
Hydrobiological Journal, Vol 14, No 4, p 100, 1978.

Descriptors: *Root systems, *Absorption, *Pesticide toxicity, DDT, Plant physiology, Plant growth, Mode of action, Root development, Rooted aquatic plants, Chlorinated hydrocarbon pesticides, Marsh plants, *Hexachlorane.

The absorption capacity of the root system of the reed Phragmites communis was studied using concentrations of DDT and hexachlorane ranging from 25 to 2000 microg/l. Low concentrations of pesticides (25 and 50 microg/l) inhibit the growth of adventitions roots in soil and water and reduce the total and active absorbing surface. In addition the cation exchange capacity and the anion exchange capacity of the roots are increased. A further increase in the concentrations of pesticides increased the total and active absorbing surface of the roots in water but decreased the same values in soil. The different reaction of the root systems to a change in pesticide concentration is hypothesized as a protective function ensuring a definite level of activity. (Deal-EIS)

THE DISTRIBUTION AND ECOLOGY OF THE NAIDIDAE (OLIGOCHAETA) WHICH INHABIT THE FILTER-BEDS OF SEWAGE-WORKS IN BRITAIN,
University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
M. A. Learner.
Water Research, Vol 13, p 1291-1299, 1979. 2 Fig, 7 Tab, 20 Ref.

Descriptors: *Worms, *Dominant organisms, *Sewerage, Animal populations, Sewage treatment, Industrial wastes, Filtration, Oligochaetes, Water chemistry, Biochemical oxygen demand, Organic loading.

A survey of sewage filter-beds situated throughout Great Britain showed that naidid worms were frequently an important component of the faunal community. The three commonest species were Nais variabilis, N. elinguis, and Pristina idrensis. Their occurrence and abundance were determined principally by the organic loading received by the beds, the amount of film present, and the presence of industrial waste. All the species found are considered beneficial to the functioning of the filter-bed. (Deal-EIS)

MACROINFAUNAL STRUCTURE AND EFFECTS OF THERMAL DISCHARGES IN A MESOHALINE HABITAT OF CHESAPEAKE BAY, NEAR A NUCLEAR POWER PLANT,
Academy of Natural Sciences of Philadelphia, PA.
T-N. Loi, and B. J. Wilson.
Marine Biology, Vol 55, p 3-16, 1979. 11 Fig, 2 Tab, 61 Ref.

Descriptors: *Biological communities, *Toxicity, *Nuclear powerplants, *Chesapeake Bay, Maryland, Water temperature, Heated water, Thermal stress, Sampling, Benthic fauna, Dominant organisms, Bottom sediments, Seasonal, Mollusks, Clams, Habitats, Mathematical models, Calvert Cliffs Nuclear Power Plant, *Species diversity, *Species diversity indices, *Polychaetes, *Shannon-Wiener index.

The soft-bottom macroinfauna of the Chesapeake Bay near the Calvert Cliffs Nuclear Power Plant, Maryland, USA, was studied quarterly in 1977. A total of 42,900 organisms distributed among 55 taxa was taken in 180 Smith-McIntyre grabs. Two communities and an ecotone between these two communities were identified in association with three sediment types: sand, sand-clay, and clay. Reproductive activities of 8 numerically dominant species are described. The macroinfauna at Calvert Cliffs was largely seasonal; species richness and organism abundances were lowest in late summer. The polychaetes Scolecolepides viridis and Heteromastus filiformis and the bivalves Macoma balthica and Mya arenaria were dominant in March-June. In September-December, the polychaetes Neanthes succinea, Paraprionospio pinnata, and Glycinde solitaria and the bivalve Gemma gemma became dominant. There were clear indications of differences associated with sediment types in total number of species, total number of individuals, and abundances of the dominant species. The shallower and intermediate habitats had higher sand-clay ratios, lower organic carbon contents, and larger numbers of organisms than the deeper clay habitat. Within each depth, no apparent detrimental effects caused by the thermal discharges on total number of species, total number of individuals, abundances of the dominant species, species diversity or evenness were found. ZOOPLANKTERS AS BIOINDICATORS OF WATER QUALITY,
Akademiya Nauk URSR, Kiev. Inst. Hidrobiologii.
M. F. Polivannaya, and O. A. Sergeyeva.
Hydrobiological Journal, Vol 14, No 3, p 39-43, 1978. 3 Fig, 1 Tab, 8 Ref.

Descriptors: *Bioindicators, *Zooplankton, *Water quality, Biological communities, Dominant organisms, Toxicity, Mathematical models, Trophic level, Mesotrophy, Oligotrophy, Biomass, Daphnia, Aquatic insects, Nematodes, Crustaceans, Water pollution effects, Aquatic populations, *Species diversity, *Species diversity indices.

The purpose of this study was to conduct a comparative evaluation of methods of biological analysis of water quality by using, as an example, zooplankton of the Dnieper River and the Kanev reservoir (USSR). Our material consisted of samples collected in the river in 1969 and 1972, and in the reservoir in 1975. The results indicate that pollution leads to less varied species composition of the zooplankton. The first to suffer are crustaceans and, among them, the nonpredator forms. Polyphagous insects (Asplanchnidae, Brachionus calyciflorus, Brachionus angularis and predator Cyclopoidae) tend to maintain themselves in the plankton. The data indicate an abrupt dip of the number of zooplankton dominants in river zones subjected to pollution and that the percentage of a few species under these circumstances. Age composition, replenishment and loss, fertility, morphometric characters of populations of leading species under normal conditions and during disturbances associated with pollution may serve as supplementary indices of water quality that are calculated in terms of zooplankton. DEPENDENCE OF THE TIME OF GAMETE MATURATION AND SPAWNING ON ENVIRONMENTAL TEMPERATURE IN THE VIRGINIA OYSTER CRASSOSTREA VIRGINICA,
Akademiya Nauk SSSR, Petrozavodsk. Dept. of Water Problems.
Z. F. Kaufman.
Hydrobiological Journal, Vol 14, No 4, p 29-30, 1978. 1 Fig, 5 Ref.

Descriptors: *Water temperature, *Toxicity, *Growth rates, *Oysters, Animal growth, Spawning, Reproduction, Mathematical models, Thermal stress, Animal physiology.

An equation is given in which the rate of gametogenesis, and the time of the first spawning and of mass spawning are a function of environmental temperature. All three processes were governed by van't Hoff's rule in the 20-30C range, i.e., an increase in temperature by 10C increased their rate by 2-3 times. This pattern was significantly altered in the range 15-20C. The rate of appearance of the first eggs was speeded up 4-fold, the time to the first spawning was reduced 1/5, and the time to mass spawning to 1/8. (Deal-EIS)

INVESTIGATIONS ON THE EFFECTS OF DOMESTIC SEWAGE ON THE BENTHIC ECOSYSTEM OF MARINE INTERTIDAL FLATS (IN GERMAN),
Hamburg Univ. (Germany, F.R.). Inst. fuer Hydrobiologie und Fischerei-wissenschaft.
G. Otte.
Helgolander wissenschaftlichen Meeresuntersuchungen, Vol 32, p 73-148, 1979. 183 Ref.

Descriptors: *Sewage effluents, *Toxicity, *Aquatic life, Benthic flora, Benthic fauna, Intertidal areas, Outfall sewers, Domestic wastes, Sewage disposal, Waste water disposal, Water chemistry, Primary productivity, Bacteria, Dominant organisms, Bioindicators, Sylt, Germany, Vancouver, British Columbia, *Species diversity.

Primary productivity of microalgae on the sediment surface was positively correlated with the degree of pollution. In heavily and mediumly polluted zones, heterotrophic bacterial production exceeded primary production rates at the sediment surface. Compared with unpolluted intertidal flats the number of macro-benthic species was not reduced in polluted mud flats. In regard to overall species abundance, the macrofauna associations of the disposal area showed three distinct zones: (1) Heavy pollution around the outfall resulted in a degradation zone either without benthic invertebrates or with a very low density of individuals; (2) medium polluted areas were characterized by a zone of maximum density; (3) with decreasing or diminishing pollution the number of individuals returned to normal values ('background values'). The distribution of species within these zones indicated a significant difference between the response of the 'channel fauna' and the 'flat fauna' to pollution: while the number of species increased continously inside the channels with decreasing pollution, the species variety of the tidal flats was positively correlated with the number of individuals. The diversity of the benthos inside the channels was negatively correlated with the degree of pollution, whereas the diversity indices for the fauna on the tidal flats increased quickly from the centre of pollution, remained at a high level in the medium polluted zone, and decreased again to the area of diminishing pollution. EFFECTS OF ARTIFICIAL ACID RAIN ON MICROBIAL ACTIVITY AND BIOMASS,
Lund Univ. (Sweden). Dept. of Microbial Ecology.
E. Baath, B. Lundgren, and B. Soderstrom.
Bulletin of Environmental Contamination & Toxicology, Vol 23, p 737-740, 1979. 1 Tab, 9 Ref.

Descriptors: *Acidic water, *Acidic soils, *Rain, Acidity, Hydrogen ion concentration, Rainfall, Artificial precipitation, Water chemistry, Bacteria, Fungi, Respiration, Physiology, Growth rates, Biomass, Soils, *Acid rain.

Respiration, FDA-active fungal length and FDA-active bacteria are all parameters related to microbial activity in the soil. These parameters all decreased in the acidified plots (Tab. 1). Total fungal length and bacterial numbers did not change significantly in response to artificial acid rain, indicating that the microbial immobilization of mineral elements was little affected in this experiment. Bacterial cell size was smaller in the most acidified plots. Mean cell size in this treatment was 0.10, m3, compared to 0.13, m3 in the control and the pH 3 treated plot. The reduced cell size could be due to changes in the bacterial population, or it could reflect a lower bacterial growth rate after treatment with pH 2 water. It seems most likely that the decreased microbial activity, directly or indirectly, is a hydrogen ion effect. However, since pH was adjusted with sulphuric acid, it cannot be excluded that the added sulphate influenced the microorganisms negatively. (Deal-EIS)

COPPER TOXICITY TO THE BAY SCALLOP (ARGOPECTEN IRRADIANS),
Environmental Research Lab., Narragansett, RI.
G. Pesch, N. Stewart, and C. Pesch.
Bulletin of Environmental Contamination & Toxicology, Vol 23, p 759-765, 1979. 2 Fig, 1 Tab, 21 Ref.

Descriptors: *Copper, *Toxicity, *Mollusks, Growth rates, Mortality, Animal behavior, Juvenile growth stage, Animal physiology, Animal metabolism, Lethal limit, Bioindicators, Inhibition, *Bioaccumulation, *Tissue analysis, *Scallops, *Argopecten.

The purpose of this study was to examine the effect of copper on survival, growth, and byssal attachment, and copper accumulation of juvenile bay scallops in a flowing water exposure system. At each of the 4 highest concentrations (110, 48, 21, and 11 microg/l) more than half of the scallops died during the 42-day experiment. At the lowest concentration, 5 microg/l, 10% of the scallops had died by day 42. An incipient LC50 value of 9.3 microg/l Cu was estimated graphically from the toxicity curve. Growth was inhibited at all concentrations. At the 4 highest concentrations (110, 48, 21, and 11 microg/l), we observed that before death the scallops detach from their substrates and lie free on the bottom of the aquaria. The response of the scallops to copper indicates an initial acute effect as shown by the detachment. However, some of the survivors adjusted to the presence of copper and reattached. The relationship between detachment and death was linear. Accumulation of copper by bay scallops in this study is comparable to data from other studies that show molluscs accumulate copper readily and elevated copper concentrations in the environment are reflected by elevated copper concentrations in molluscs. EVALUATION OF SAPROBICITY OF THE VOLGOGRAD RESERVOIR IN TERMS OF THE PHYTOPLANKTON,
Akademiya Nauk SSSR, Borok. Inst. Biologii Vnutrennykh Vod.
A. G. Okhapkin, and G. V. Kuz'min.
Hydrobiological Journal, Vol 14, No 3, p 35-39, 1978. 2 Fig, 3 Tab, 11 Ref.

Descriptors: *Productivity, *Phytoplankton, *Reservoirs, Seasonal, Aquatic populations, Sewage effluents, Trophic level, Dominant organisms, Diatoms, Aquatic algae, Cyanophyta, Mesotrophy, Oligotrophy, Monitoring.

The saprobicity of the Volgograd reservoir and ratio of indicator species changed during the vegetative period. The peak saprobicity indexes in summer dropped due to intensification of self-purification processes. In autumn they were almost the same as in summer. The saprobicity of the water downstream of cities increased due to effluents. A comparison with the data available in literature showed a gradual rise in saprobicity of the Volga from 1902 to the present. (Deal-EIS)

Journal of Ichthyology, Vol 16, p 1001-1006, 1976. 5 Fig, 14 Ref.

Descriptors: *Carp, *Fish diseases, *Strontium radioisotopes, Absorption, Path of pollutants, Radiochemical analysis, Animal pathology, Radioisotopes, Growth stages, Fish physiology, Animal metabolism, *Tissue analysis.

An investigation was made of the distribution of strontium 90 in the eye tissues of the grass carp (Ctenopharyngodon idella) from the chronic uptake of this radionuclide. It was found that the nature of the distribution of strontium 90 in the eye tissues was not identical. The largest amount of the isotope is found in the lens, the least amount in the retina. Localization of strontium 90 is observed in the photoreceptor cells on the outer membrane of the segments of the cones and rods and on their disk membranes. The chronic uptake of the radionuclide by grass carp fingerlings over a period of 2 months led to pathological changes in the eye tissues. (Deal-EIS)

Catfishes, Cytological studies, Pesticide residues, Mortality, *Tissue analysis, *DDVP, *Parathion, *Phosphamidon, *Bioaccumulation, India, Punarbhava River.

A survey made in West Bengal to evaluate the influence of pesticides on aquatic ecosystems showed that pesticides killed many fishes in Punarbhava River, West Dinajpur, in August 1970. The paddy fields near the river recieved the insecticides: DDVP, phosphamidon and parathion. The tissues of gills, alimentary tract, liver and brain of the exposed carp (Labeo rohita) and catfish (Heteropneustes fossilis) were found severely damaged. The pesticide residue in fish was in levels that may cause hazard to fish eaters. (Deal-EIS)

TAXONOMIC NOTES ON EPIPHYTIC DIATOMS OF MISSISSIPPI SOUND, U.S.A.,
Mississippi State Univ., Mississippi State. Dept. of Biological Sciences.
M. J. Sullivan.
Nova Hedwigia, Vol 64, p 241-249, 1979. 1 Fig, 7 Ref, 4 Pl. OWRT A-114-MISS (3), 14-34-0001-8026.

Descriptors: *Diatoms, *Systematics, *Electron microscopy, *Sessile algae, *Rooted aquatic plants, Ecological distribution, Biogeography, Marine algae, Submerged plants, Aquatic habitats, Mississippi, *Epiphytic algae, *Seagrasses, Horn Island(Miss. Sound), Halodule, Syringodium, Thalassia.

Epiphytic diatoms were collected from the leaves of three seagrass species (Halodule beaudettei, Syringodium filiforme, and Thalassia testudinum) in Mississippi Sound during the summer of 1977. A previous paper by the author showed that nearly identical diatom communities were found on each seagrass based on the distribution of the more abundant taxa and statistical comparisons. The present paper provides taxonomic information on selected diatom taxa using light and scanning electron microscopy. Of the eight taxa treated, five are araphid forms. Descriptions of the majority of these taxa based on light microscope observations are herein amplified by examination of cleaned material under the scanning electron microscope.

EFFECTS OF DINOFLAGELLATE BIOLUMINESCENCE ON THE INGESTION RATES OF HERBIVOROUS ZOOPLANKTON,
Old Dominion Univ., Norfolk, VA. Inst. of Oceanography.
H. S. White.
Journal of Experimental Marine Biology and Ecology, Vol 36, No 3, p 217-224, February, 1979, 2 Fig, 22 Ref.

Descriptors: *Bioluminescence, *Dinoflagellates, *Grazing, *Predation, *Copepods, Zooplankton, Cytological studies, Regression analysis, Animal physiology, Florescence, Cultures, Digestion, Diets, Feeding rates, Food habits, Animal populations, Denisty, Swimming, Movement.

Acartia tonsa, a copepod, grazes more slowly on the Dingflagellate Gonyaulax excavata when the latter is highly luminescent, except at lowest experimental concentrations (<500 cells/ml). Natural zooplankton organism concentrations cannot exhaust bioluminescence of healthy Gonyaulax excavata cells. Highly luminescent culture depress grazing rates 50-75% relative to weakly and very weakly bioluminescent cultures. The regression line slope for highly luminescent cultures is significantly different from that of the other two ($P=0.99$). In-situ grazing rates on dinoflagellates fluctuate in response to changes in cell bioluminescent capacity. This is especially true at high cell densities, such as exist during a bloom. Culture experiments used one animal/3 ml (333 animals/1), however, normal natural concentrations are considerably lower. A. clausi stimulates 0.3-2.2% (average 1.1%) of the luminescent capacity per minute, while Pseudocalanus minutus stimulates only 0.0-0.1%, indicating interspecific differences. Therefore, bioluminescence may not equally deter all predator types. A. clausi copepods move in a series of short darts forward, while P. minutus moves in a smooth glide. The latter swimming apparently does not shear cells with a force above emission threshold. Results suggest dinoflagellate bioluminescence effectively reduces predator grazing and cell populations have sufficient emission capacity to respond to continual animal activity. (Danovich-Wisconsin)

CARNIVOROUS FEEDING BEHAVIOR OF THE ADULT CALANOID COPEPOD ACARTIA TONSA DANA,
Maryland Univ., Solomons. Chesapeake Biological Lab.
D. J. Lonsdale, D. R. Heinle, and C. Siegfried.
Journal of Experimental Marine Biology and Ecology, Vol 36, No 3, p 235-248, February, 1979. 7 Fig, 2 Tab, 42 Ref. ERDA AT-(401-1)14848, NSF SMI76-03130.

Descriptors: *Copepods, *Predation, *Food habits, *Animal behavior, Size, Algae, Diets, Digestion, Speciation, Denisty, Growth stages, Foods, Food abundance, Carnivores, Omnivores, Cultures, Laboratory tests, Ecology, Regression analysis.

Significantly high predation rates of Acartia tonsa on its potential competitors may affect copepod seasonal variation and species composition. A. tonsa flexibility in exploiting food resources may be the major reason why this copepod dominates estuarine and coastal waters. Laboratory experiments observed carnivorous feeding behavior of A. tonsa, a calanoid copepod known to be omnivorous. A. tonsa adults feed on various copepod nauplii species including A. tonsa, Scottolana canadensis, Oithona colcarva, and Eurytemora affinis. Selection experiments show A. tonsa adults avoid A. tonsa nauplii as prey and prefer E. affinis and S. canadensis nauplii. Preconditioning A. tonsa adults with one of the three nauplii species does not alter this selection against A. tonsa nauplii. Naupliar size is also important; smaller sized prey are usually preferred. Ingestion rate of Pseudoisochrysis (algae) by adult A. tonsa (0-1.23 million cu micro m/adult h) with no nauplii available increases with algal concentration (0.16-1.51 ppm). Ingestion rate of algae (0-1.48 million cu micro m/adult h) with an alternate food source, either A. tonsa or S. canadensis nauplii, also increases with algal concentration (0.14-2.35 ppm). A. tonsa adult predation rates on A. tonsa nauplii increases with greater prey densities. This is observed with algae present or absent. (Danovich-Wisconsin)

THE EFFECTS OF VERTICAL STABILITY ON PHYTOPLANKTON DISTRIBUTIONS IN THE SUMMER ON THE NORTHWEST EUROPEAN SHELF,
Institute of Oceanographic Sciences, Wormley (England).
R. D. Pingree, P. M. Holligan, and G. T. Mardell.
Deep-Sea Research, Vol 25, No 11, p 1011-1028, November 1978. 11 Fig, 2 Tab, 28 Ref.

Descriptors: *Phytoplankton, *United Kingdom, *Continental shelf, *Water circulation, *Vertical distribution, Mixing, Distribution, Tides, Tidal effects, Water temperature, Chlorophyll, Depth, Nutrients, Winds, Thermal stratification, Mathematical models, Hydrologic aspects, Growth rates, Upwelling, Wind tides, Summer, Primary productivity, Diatoms, Dinoflagellates.

Phytoplankton distributions in frontal regions on the Northwest European Shelf, July 1977, are interpreted in terms of tidal energy dissipation rate per unit mass, E, and water depth scaled by the extinction coefficient. These two parameters largely determine the physical environment in which phytoplankton growth and the area between $-2.0<\dot{E}<-1.0$, which includes frontal boundaries and shallow thermoclines, defines the most productive region during summer months. Data were analyzed for separate geographical areas; western North Sea, northwestern North Sea, between Scotland and Ireland and Celtic Sea and western English Channel. In weakly-stratified and well-mixed waters diatoms are most abundant. Species composition varies from benthic types inshore to neritic and more oceanic communities; few dinoflagellates are found. In surface waters overlying well-developed thermoclines, chlorophyll-a levels are generally low and dinoflagellates are dominant. Phytoplankton populations in the thermocline are in three groups according to surface-to-bottom temperatures differences (TD): $TD<3$ C, dinoflagellates and diatoms; TD 3-6 C, dinoflagellates; and $TD>6$ C, flagellates. In frontal regions, mixed populations of dinoflagellates and diatoms form high chlorophyll concentrations. Species composition differences probably reflect variations in nutrients. Chlorophyll-a distributions relate to availability of light and inorganic nutrients for phytoplankton growth which, in turn, are determined by vertical stability, depth and turbidity of the water column. (Danovich-Wisconsin)

NITRATE AND PHYTOPLANKTON PRODUCTION IN SOUTHERN CALIFORNIA COASTAL WATERS,
Scripps Institution of Oceanography, La Jolla, CA.
R. W. Eppley, E. H. Renger, and W. G. Harrison.
Limnology and Oceanography, Vol 24, No 3, p 483-494, May, 1979. 7 Fig, 40 Ref. USDOE EY-76-C-03-0010, PA20.

Descriptors: *Nitrates, *Primary productivity, *Phytoplankton, *Coasts, *Southern California, *Euphotic zone, Standing stocks, Equations, Environmental gradient, Carbon, California, Photosynthesis, Diffusion, Correlation analysis, Testing, Upwelling, Nutrients, Nutrient transport, Depth, Diffusivity, Biochemistry, Marine biology.

Nitrate transport into the euphotic zone is the major factor regulating phytoplankton standing stock and production in southern California coastal waters. This was tested by examining the null hypothesis that phytoplankton production is independent of nitrate input rates to the euphotic zone. The null hypothesis is rejected due to the low surface nitrate concentration, 0.5 micro g-at/l, in southern California coastal waters, except during strong upwelling. Carbon and nitrate assimilation rates are related; rank difference correlation coefficient is 0.73, implying that 53% of the variation in either variable is explainable by its correlation with the other. Further evidence includes the following: (1) Phytoplankton standing stock and production rate relate to vertical nitrate concentration gradient depth. (2) Particulate organic matter chemical composition, expressed as POC:PON ratio, relates to phytoplankton C:N assimilation ratio. (3) Regenerated production, measured as ammonium assimilation, is proportional to nitrate assimilation rate, implying parallel and concurrent increases in heterotrophic microplankton and phytoplankton production due to new euphotic zone nitrate inputs. (4) Vertical nitrate diffusion, when calculated from vertical nitrate concentration gradients and nitrate assimilation rates, reasonably estimates vertical eddy diffusivity for nitrate. Eleven quarterly cruises in the Southern California Bight, February 1975-August 1977, provided data for this report. (Danovich-Wisconsin)

THE DISTRIBUTION OF ALGAL EPIPHYTES ON MACROPHYTE HOSTS OFFSHORE FROM LA PARGUERA, PUERTO RICO,
Puerto Rico Univ., Mayaguez. Dept. of Marine Sciences.
D. L. Ballantine.
Botanica Marina, Vol 22, No 2, p 107-110, February 1979. 1 Fig, 2 Tab, 19 Ref.

Descriptors: *Marine algae, *Epiphytology, *Distribution, *Hosts, *La Parguera, Puerto Rico, Marine plants, Caribbean Sea, Bryothamnion triquetrum, Laurencia poitei, Digenia simplex, Dasya pedicellata, Halymenia floresia, Crysemenia enteromorpha, Ceramium byssoideum, Polysiphonia havanensis, Calithamnion byssoides, Microcoleus lyngbyaceus, Plant pathology, Distribution patterns, Biological communities, Age, Macrophytes, Algae.

During August 1973 - May 1976, 122 species of epiphytes were identified from an algal plain located two miles off the southwest coast of Puerto Rico. Hosts vary in ability to support epiphytic communities. Bryothamnion triquetrum, Laurencia poitei and Digenia simplex generally support abundant epiphytes. Large plants of Dasya pedicellata, Halymenia floresia and Crysymenia enteromorpha are frequently devoid of epiphytes. On almost all hosts, a general zonation pattern of epiphytes is observed. Epiphytism is heaviest on older portions of host plants. It is lightest near meristematic regions. On favorable hosts, epiphytes are distributed closer to apical tips than on non-favorable hosts, although colonization is heaviest on older portions in both types of hosts. Composition of epiphytic species also commonly differs between young and old portions of algal hosts. On uppermost portions of favorable hosts the most common epiphytic species are Ceramium byssoideum, Polysiphonia havanensis, Calithamnion byssoides and Microcoleus lyngbyaceus; on non-favorable hosts these species are sometimes the only epiphytes present. Proceding from younger to older portions of the host, the colonizing species become more abundant and diverse. Oldest host portions are occasionally totally covered with epiphytes. Here the cover of the calcareous Melobesiacean crust frequently approaches 100%. Coralline red algae Corallina, Jania and Amphiroa commonly grow over the crust. (Harris-Wisconsin)

THE MICRODISTRIBUTION OF EPIPHYTES ON THE LEAVES OF NATURAL AND ARTIFICIAL MACROPHYTES,
McGill Univ., Montreal, (Quebec). Dept. of Biology.
A. Cattaneo.
British Phycological Journal, Vol 13, No 2, p 183-188, June 1978. 7 Fig, 1 Tab, 9 Ref.

Descriptors: *Epiphytology, *Artificial substrates, *Laboratory tests, *Microenvironment, *Distribution, Chlorophyta, Epiphytes, Cocconeis placentula, Eunotia spp., Analytical techniques, Coleochaete orbicularis, Coleochaete nitellarum, Diatoms, Leaves, Algae, Colonization, Plant pathology, Macrophytes.

Microdistribution of two diatoms (Cocconeis placentula and Eunotia spp.) and two epiphytic green algae (Coleochaete orbicularis and C. nitellarum) on leaves of Potamogeton richardsonii and on those of plastic aquarium plants was compared. Eunotia spp. and Coleochaete orbicularis were significantly more abundant on the underside of natural leaves while C. nitellarum significantly preferred the upper side. There were no significant differences among these taxa in their colonization of the two sides of artificial leaves; however, C. placentula showed a significant preference for the upper side of plastic leaves but had no similar preferences on natural plants. Differential colonization on the upper side and underside of natural leaves by Eunotia spp. and C. orbicularis is attributed to calcium trioxide incrustation on upper sides of leaves. These incrustations reduced colonization space. Diatoms showed significant preference for edges on both natural and plastic leaves. Intense development of green algae on lamina was noted on plastic leaves only. Preference of colonizing leaf margins by diatoms and green algae is possibly related to more favorable illumination and/or nutrient renewal at those parts of the host leaf. (Harris-Wisconsin)
W80-03798

PHYTOPLANKTON DISTRIBUTION AND LIGHT ATTENUATION IN PORT HACKING ESTUARY,
Commonwealth Scientific and Industrial Research Organization, Cronulla (Australia). Div. of Fisheries and Oceanography.
B. D. Scott.
Australian Journal of Marine and Freshwater Research, Vol 29, No 1, p 31-44, February 1978. 8 Fig, 1 Tab, 20 Ref.

Descriptors: *Phytoplankton, *Distribution, *Attenuation, *Light, *Estuarine environments, Photosynthesis, Port Hacking Estuary, Australia, Australia, Vertical distribution, Horizontal distribution, Chlorophyll-a, Estuaries, Fluorescence, Solar radiation, Detritus, Suspended solids, Sedimentation, Biomass, Spatial distribution.

In-vivo chlorophyll fluorescence, phytoplankton photosynthesis rates at constant irradiance, and solar irradiance attenuation by water columns were measured in sea water samples taken from Port Hacking estuary near Sydney, Australia, in order to obtain phytoplankton distribution patterns. Five general conclusions are derived: (1) Phytoplankton distribution within the South West Arm in Port Hacking estuary is almost uniform horizontally. Vertical distribution is rarely uniform, with manima occuring at depths of 2-6 m. (2) Although horizontal phytoplankton distribution is fairly uniform, distribution can be grouped according to locality and magnitude. The magnitude and similarity of chlorophyll to photosynthesis in ratios of these groups indicates that phytoplankton biomass adjusts so that it is optimal to nutrient flux. (3) Attenuation of solar radiation by the water columns is near uniform both horizontally and vertically, with attenuation coefficients with 10% of the mean value within South West Arm except in times of heavy rainfall when introduced sediments occur in the upper 6 m of the water column. (4) Secimentation removes more than 22% of the suspended sediments and phytoplankton from the water column. (5) Because phytoplankton contribution to the total attenuation coefficient is only 0.013 per meter, the chlorophyll-attenuation relationship is of limited use in estimating optical properties of the water column from chlorophyll measurements. (Harris-Wisconsin)
W80-03799

APPLICATION OF IN SITU CAGE CULTURES OF PHYTOPLANKTON FOR MONITORING HEAVY METAL POLLUTION IN TWO NORWEGIAN FJORDS,
Trondheim Univ., (Norway). Inst. of Marine Biochemistry.
I. Eide, A. Jensen, and S. Melsom.
Journal of Experimental Marine Biology and Ecology, Vol 37, No 3, p 271-286, March 22, 1979. 4 Fig, 6 Tab, 30 Ref.

Descriptors: *On-site data collections, *Heavy metals, *Fjords, *Cultures, *Diatoms, *Research equipment, *Industrial wastes, Monitoring, Sampling, Water pollution sources, Zinc, Lead, Absorption, Cadmium, Mercury, Norway, Orkdalsfjord, Norway, Trondheims-fjord, Norway, Sorfjord, Norway, Hardangerfjord, Norway, Growth rates, Environmental effects.

A simple field apparatus for cage cultivation of marine planktonic algae consist of a perforated Perspex box 35 cm per side rope-suspended by a buoy at one m depth. A rotor with algal cultures contained in dialysis tubing is turned inside the box by an electrically driven sealed magnet. A tube containing a chelating resin and fitted with a filter is also attached; water is drawn continuously through the filter pack and column and stored in a collector flask for exact determination of sampled volume. Three test sites were equipped in each of two Norwegian fjords: Orkdalsfjord (abranch of Trondheimsfjord) along the central Atlantic coast, and the Sorfjord branch of Hardangerfjord about 300 km to the south. Both fjords are point sources of heavy metals loading from metallurgic industries located in the innermost part of the fjord. Averages were obtained for dissolved and particularate heavy metal content at various sites. Zinc, lead, cadmium and mercury showed differences in the proportion of dissolved to particularate fractions. Three species of tested diatoms gave systematic growth responses to heavy metal pollution in the moderately polluted Sorfjord. One alga died and one showed reduced growth rate at the more contaminated site compared with those at less polluted sites, while the most tolerant alga was apparently not affected. Only the most tolerant alga survived in the more heavily polluted fjord, showing decreasing growth rate with increasing pollution. Uptake of heavy metals increased generally with increasing metal content. (Harris-Wisconsin)

Botanica Marina, Vol 22, No 7, p 413-420, October 1979. 6 Fig, 4 Tab, 16 Ref.

Descriptors: *Standing crops, *Seasonal, *Algae, *Indian River(FL), *Distribution patterns, *Aquatic drift, *Biological communities, *Marsh plants, *Estuaring environments, Biomass, Distribution, Drifting(Aquatic), Regression analysis, Speciation, Variability, Water temperature, Light intensity, Statistical methods, Statistics, Mathematical studies, Salinity, Estuaries, Florida, Grassed waterways.

Observations of a 50 ha seagrass flat near Fort Pierce Inlet on the Indian River, Florida September 1975-August 1976, show highest biomass (12 g dwt/sq m) in spring when water temperatures are 23-27C; light energy 400-500 Langleys/D; and salinity 33-34 ppt. Biomass variation corresponds well to variations in temperature, salinity and light, declining in mid-fall then rising in mid-winter and continuing to increase until onset of the rainy season in May. Biomass remains low during summer when temperature and light energy are highest. Species numbers are highest in September and May and lowest in October and July. Sixty-three species, including epiphytes, were identified: 3 Cyanophyta (5%), 12 Chlorophyta (19%), 9 Phaeophyta (14%), and 39 Rhodophyta (62%). The most common species are Dictoyota dichotoma, Acanthophora specifera, Hypnea cervicornis, H. musciformis and Spyridia filamentosa. Seasonal dominants include brown alga Rosenvingea intricata and red alga Chondria tenuissima. Algal biomass frequency distributions are contagious in September and January - May, suggesting aggregated populations. Little or no drift algae is found in a large number of samples in winter-spring months. In September when biomass is relatively high, contagion is highly significant due to dominance of one species, Acanthophora specifera. Low randomness values in other months suggest distributional regularity. From October to December biomass values decline; all species are present with nearly equal weight and low density, indicating low rendomness. (Danovich-Wisconsin)

TEMPERATURE EFFECTS ON STEADY-STATE GROWTH, PHOSPHORUS UPTAKE, AND THE CHEMICAL COMPOSITION OF A MARINE PHYTOPLANKTER,
Woods Hole Oceanographic Institution, MA.
J. C. Goldman.
Microbial Ecology, Vol 5, No 3, p 153-166, 1979. 6 Fig, 1 Tab, 34 Ref.

Descriptors: *Kinetics, *Nutrient requirements, *Phosphorus, *Temperature, *Chrysophyta, *Growth rates, *Nutrient flux models, Nutrients, Phytoplankton, Monochrysis lutheri, Algae, Cytological studies, Nitrogen, Carbon, Cycling nutrients, Equations, Limiting factors, Laboratory tests, Cultures, Monod equation.

Continuous culture experiments on the marine chrysophyte Monochrysis lutheri under phosphorus limitation in 15-23C temperatures show that phytoplankton growth and limiting-nutrient uptake rates are only synchronous at or near optimum temperature. Temperature effects on nutrient uptake rates are species specific and extremely complicate. Therefore, temperature should not be included as a variable in nutrient flux models. The Arrhenius equation well describes the response of phytoplankton maximum growth rates to temperature. Temperature effects on cell quota and steady-state phosphorus uptake rates during phosphorus limitation are much more complicated than similar effects on growth rates. M. lutheri growth and uptake are synchronous between 18.8 and 23C; however, a doubling in phosphorus cell quota at 15C leads to a significant uncoupling between growth and assimilation processes. While phosphorus uptake rate on a cell basis increases dramatically at 15C, turnover rates of total available phosphorus are unaffected by temperature. If the specific growth rate is constant at 0.20/d, phosphorus nutrient uptakes rates are 0.005-0.006 pg P/cell d between 18.8-23C, but are 0.011 pg P/cell d at 15C. Carbon and nitrogen cell quotas are relatively invariant with growth rate at each temperature; uptake rates are not nearly as affected at 15C as phosphorus uptake rates. However, nitrogen uptake is accelerated at 23C which is close to optimum temperature, stripping both nitrogen and phosphorus from solution. (Danovich-Wisconsin)

TWO PHASES OF THE PHYTOPLANKTON COMMUNITY IN THE BAJA CALIFORNIA UPWELLING,
Instituto Investigaciones Pesqueras, Barcelona (Spain).
M. Estrada, and D. Blasco.
Limnology and Oceanography, Vol 24, No 6, p 1065-1080, November 1979. 11 Fig, 3 Tab.

Descriptors: *Phytoplankton, *Principal component analysis, *Red tide, *Marine algae, Statistical methods, MESCAL I, MESCAL II, Punta San Hipolito, Baja California, Mexico, Dinoflagellates, Salinity, Upwelling, California Current, California Undercurrent.

Principal component analysis was applied to quantitative data on 60 phytoplankton species collected during cruises of MESCAL I and MESCAL II of Punta San Hipolito, Baja California March 1972 and March-May 1973, respectively. Higher positive values of the dinoflagellate component correspond to areas of relatively low salinity and high nutrient concentrations, associated with upwelling water from below the minimum salinity core of the California Current. Diatom dominance is related to upwelling of deeper saline and high nutrient water from the California Undercurrent. Species with highest loadings in the analysis of MESCAL I data are predominantly dinoflagellates. The first principal component is related to the red tide that occupied the area during the first cruise. Gonyaulax polyedra with a correlation coefficient of 0.88 with the first principal component is the dominant species. During MESCAL II no red tide was seen, but the ordination of species according to loadings is indicated in the presence of red tide. Loadings of the second principal component of MESCAL II are similar to loadings of the first principal component of MESCAL I, suggesting that these components can be jointly considered and represent a persistent pattern in phytoplankton composition. Distribution of the dinoflagellate bloom component shows patterns very similar to that of salinity. (Harris-Wisconsin)

PHOTOSYNTHESIS IN THE AQUATIC MACROPHYTE EGERIA DENSA. III GAS EXCHANGE STUDIES,
Auckland Univ. (New Zealand). Dept. of Botany.
J. A. Browse, F. I. Dromgoole, and J. M. A. Brown.
Australian Journal of Plant Physiology, Vol 6, No 4, p 499-512, August 1979. 6 Fig, 2 Tab, 43 Ref.

Descriptors: *Photosynthesis, *Absorption, *Egeria densa, *Infrared gas analysis, Analytical techniques, Submerged plants, Bicarbonates, Carbon dioxide, Inorganic compounds, Aquatic plants, Gases, Resistance, Kinetics, Cytological studies, Macrophytes, Gas chromatography, Biochemistry.

Infrared gas analysis techniques were used to study inorganic carbon uptake by Egeria densa. The CO2 response of photosynthesis in this plant is analyzed in terms of the resistance concept used in terrestial plant studies; the extent to which becarbonate ions contribute to photosynthesis is also assessed. Data for photosynthesis at various free CO2 concentrations and 4.5 pH show that carbon fixation by E. densa is saturated only at very high free CO2 concentrations (about 400 um), corresponding to 1% CO2 in the gas phase. Carboxylation and mesophyll resistances, 3800 s/m and 9000 s/m, respectively, in E. Densa are considerably higher than in aerial plant leaves. The boundary layer is the highest component (greater than 27,000 s/m) of total resistance. Closed and open-circuit gas exchange experiments demonstrate that bicarbonate is taken up by plant cells and does not act merely as an inorganic carbon reservoir for CO2 production at the plasmalemma. Bicarbonate stimulation activates photosynthesis, even when free CO2 concentration is below the CO2 compensation point. The total resistance of bicarbonate uptake is 8-12 times that of CO2 uptake, not as a result of CO2 assimilation but rather as a result of active uptake, transport and conversion of CO2 involved in bicarbonate. (Harris-Wisconsin)

ZOOPLANKTON IN A QUASI-STABLE PHASE IN AN ENDORHEIC LAKE (LAKE CHILWA, MALAWI),
University of the Witwaterstrand, Johannesburg (South Africa).
M. Kalk.
Hydrobiologia, Vol 66, No 1, p 7-15, September 1979. 4 Fig, 27 Ref.

Descriptors: *Zooplankton, *Lake Chilwa, Malawi, *Water level fluctuations, *Population dynamics, *Density, *Distribution, Tropodiaptomus kraepelini, Diaphanosoma excisum, Daphnia barbata, Seasonal, Dominant organisms, Water levels, Turbidity, Light penetration, Population, Speciation, Crustaceans, Filter feeders, Predation, Salinity, Algae, Plant growth.

Zooplankton density and distribution in Lake Chilwa, Malawi, was stable 1975-1976; this 700 sq km shallow endorheic lake dried up completely in 1968 and filled up again a year later. Year-around dominant species are Tropodiaptomus kraepelini and Diaphanosoma excisum, with additional dominance by Daphnia barbata during cooler dry months. These facultative feeders utilize detritus washed from the decay of Typha in surrounding swamps. Low numbers or total exclusion of other zooplankton species common in permanent African lakes, is attributed to limited quantities of green algae, submerged vascular plants, and blue-green algae which are not abundant because of prevailing high turbidity and low light penetration. Heavy fish predation of larger (>1.5 mm) zooplankton also occurs. Although a hundred-fold seasonal variation in density of zooplankton occurs, numbers stabilize in the coldest month with D. barbata compensating for loss of other dominant species. Three-fold dilution of the lake with rains and the corresponding change in salinity does not affect zooplankton density. (Harris-Wisconsin)

INFLUENCE OF THE SHELF-BREAK FRONT OFF NOVA SCOTIA ON PHYTOPLANKTON STANDING STOCK IN WINTER,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Oceanography.
R. O. Fournier, M. Van Det, J. S. Wilson, and N. B. Hargreaves.
Journal of the Fisheries Research Board of Canada, Vol 36, No 10, p 1228-1237, October 1979. 6 Fig, 4 Tab, 30 Ref.

Descriptors: *Phytoplankton, *Boundaries(Surfaces), *Productivity, *Continental slope, *Population dynamics, *Destratification, Nova Scotia, Turbulent boundary layers, Standing crops, Biomass, Temperature, Salinity, Chlorophyll-a, Continental shelf, Primary productivity, Mixing, Winter, Light, Light intensity, Population, Stratification.

Observations of phytoplankton in the shelf-break front off the coast of Nova Scotia were made during winters of 1977 and 1978. Chlorophyll-a in the euphotic zone correlates with the inclination of the surface front. It was concluded that the steep-

ness of the front influences the depth of phytoplankton mixing by controlling illumination received by individual cells. Two extremes of the subsurface front were apparent in experimental observations: a vertical extreme containing very little phytoplankton biomass; and horizontal extreme containing significant quantities of chlorophyll. Mathematical estimates were made on how various magnitudes of decreased frontal inclination and corresponding magnitudes of shallowing of mixed layers increase phytoplankton production. Shallowing of the mixed layer to less than 25 meters produces chlorophyll increases equivalent to that observed at 8 m. Reducing the mixed layer to 17.5 m yields the maximum rate of augmentation of new plant material. The number of 5-day intervals necessary to achieve a 25% increase in growth declines from 21 at 35 m to 6.6 at 15 m. A reduction in the depth of the mixed layer to between 15 and 20 m causes rapid increases in chlorophyll. (Harris-Wisconsin)

TWO ELECTIVITY INDICES FOR FEEDING WITH SPECIAL REFERENCE TO ZOOPLANKTON GRAZING,
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
H. A. Vanderploeg, and D. Scavia.
Journal of the Fisheries Research Board of Canada, Vol 36, No 4, p 362-365, April 1979. 3 Fig, 11 Ref.

Descriptors: *Grazing, *Zooplankton, *Analytical techniques, *Food chains, *Food habits, Feeding rates, Indices, Mathematical models, Secondary productivity, Estimating equations, Particle size, Particle shape, Foods, Equations, Curves, Mathematical studies.

Two electivity indices which have been commonly used to quantify size-selective grazing by zooplankton are shown to be inefficient in answering two grazing-related research questions: First, are particles of certain sizes 'selected' in preference to others. Second, does this selection depend on the shape of the particle-size spectrum of the food offered. Under conditions of passive mechanical particle-size selection, these indices yield electivity vs. particle-size curves that vary with the shape of the particle-size spectrum of food offered to zooplankton. In addition to this bias, poor electivity estimates are obtained unless only a small fraction of food is eaten in such experiments. A new electivity index is recommended in place of one of the standard indices to quantify feeding zooplankton preferences; a measurement in which the new index is held constant. The new index is calculated from filtering rates or mortality rates. Not only can size selection be investigated with these indices, but also preferences based on taste or other factors. SEASONAL CHANGES OF BACTERIOPLANKTON IN A RESERVOIR RELATED TO ALGAE. I. NUMBERS AND BIOMASS,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
V. Straskrabova, and J. Komarkova.
Internationale Revue der Gesamten Hydrobiologie, Vol 64, No 3, p 285-302, 1979. 10 Fig, 9 Tab, 33 Ref.

Descriptors: *Bacteria, *Potable water, *Klicava Reservoir, Czechoslovakia, *Biomass, *Algae, *Seasonal, *Population dynamics, Microorganisms, Reservoirs, Environmental sanitation, Impoundments, Zooplankton, Seasonal, Distribution, Organic compounds, Carbon, Biodegradation, Population, Plankton.

Samples of drinking water supply from Klicava Reservoir near Prague, Czechoslovakia were collected at ten-day intervals March-October, 1967. Changes in bacterial counts and algal biomass show a similar pattern. Four bacterial peaks occur during the season, either coinciding with algal maxima or occurring ten days later. In July, both bacterial and algal numbers decrease sharply. Average volumes of bacterial cells, corrected for shrinkage, are mostly lower than 0.2 cv micro m. The largest bacterial cell volumes and their greatest variability occur August - October. Bacteria in clusters of four or more cells account for 20% of the total count. The maximum concentration of bacterial biomass at the surface is 0.38 cv micro m/l with mean values 0.8 - 0.10 micro m/l. Bacterial carbon averages 4 - 40% of algal carbon, and about 50% of zooplankton carbon. Dissolved organic carbon is 2 - 3 times higher than that of bacterioplankton, thus suggesting resistance of most dissolved organic compounds to bacterial decomposition. (Harris-Wisconsin)

ANEROBIC METABOLISM OF IMMEDIATE METHANE PRECURSORS IN LAKE MENDOTA,
Wisconsin-Univ., Madison. Dept. of Bacteriology.
M. R. Winfrey, and J. G. Zeikus.
Applied and Environmental Microbiology, Vol 37, No 2, p 244-253, February, 1979. 5 Fig, 4 Tab, 36 Ref. NSF DEB 73-01511-A01 and DEB 782-4071.

Descriptors: *Methane bacteria, *Metabolism, *Lake Mendota(WI), *Limiting factors, *Anaerobic conditions, *Microbial degradation, Microbiology, Sediments, Water chemistry, Seasonal, Competition, Sediment-water interfaces, Anaerobic bacteria, Methane, Carbon dioxide, Decomposing organic matter, Degradation(Decomposition), Stratification, Turnovers, Microorganisms, Substrates.

Methanogenesis in Lake Mendota, Wisconsin sediments is limited by immediate methane precursor availability (acetate and hydrogen), by competition for these substrates by nonmethanogens, and by seasonal variations which alter sediment and water chemistry. During stratification, methanogenesis is observed in waters overlying sediments, but during turnovers, it is first detected several centimeters below the sediment-water interface. During turnover, oxygenated water is mixed throughout the water column and oxygen-sensitive methanogens are inhibited. Due to extremely small acetate pool size (3.5 micro M) in Lake Mendota, competition for this energy source between methane and acetate-oxidizing organisms may greatly affect methano-genesis. Acetate and hydrogen pool sizes are very small and turn over rapidly in sediments (0.22 for acetate). The dissolved inorganic carbon pool is large (6.4-8.3 mM) however, and turnover time is slow (111 h). In Lake Mendota sediments the rate-limiting step in methanogenesis is the rate at which hydrogen and acetate are supplied to the small methane precursor pool. Both hydrogen/carbon dioxide and acetate are simultaneously converted to methane in sediments, even with excess hydrogen or acetate present. In Lake Mendota sediments, 41% of the methane is derived from HCO3-C. Based on the assumption that CO2 and acetate alone are methane-C precursors in nature, 59% of the methane is formed from acetate. A NINE-YEAR STUDY OF THE PHYTOPLANKTON OF THE EUTROPHIC AND NONSTRATIFYING LOCH LEVEN (KINROSS, SCOTLAND),
Institute of Terrestial Ecology, Edinburgh (Scotland). Plankton Ecology Project Group.
A. E. Bailey-Watts.
The Journal of Ecology, Vol 66, No 3, p 741-771, November 1979. 14 Fig, 7 Tab, 90 Ref.

Descriptors: *Loch Leven, Scotland, *Eutrophication, *Phytoplankton, *Water pollution effects, *Organic loading, Nonpoint sources, Lakes, Daphnia hyalina, Zooplankton, Cyclops strenuus abyssorum, Sampling, Nitrates, Fertilizers, Oscillatoria agardhii, Chlorophyll-a, Plant populations, Distribution patterns, Density, Aquatic algae, Baseline data, Size, Phosphates.

Qualitative and quantitative changes are described which occured in phytoplankton populations of shallow, eutrophic and non-stratifying Loch Leven, located in a catchment area of 70% arable land in Scotland's Plain of Kinross with heavy loadings of nitrates from agricultural fertilizers. Sampling conducted weekly 1968-1976 showed marked seasonal and annual differences in species composition and population densities. Four trends were substantiated by the nine years of sampling: (1) Although dry weight and phytoplankton totals decreased temporarily in 1976 (coincidental with massive growth of a pale form of Oscillatoria agardhii Gomont), these two measures and chlorophyll-a concentrations all decreased over the full sampling period. (2) Dominant algae size increased and the total number of individuals producing various population maxima decreased; a 3000-fold increase in size accompanied the change toward large species which replaced nannoplankton forms. Earlier measurements of 100,000-1,000,000 individuals/ml were reduced to population maxima of 10,000/ml in later measurements. (3) The continual changes in species composition were associated with strong variations in percentage of chlorophyll-a of crop dry weight and ratios of chlorophyll-a to volume, and of dry weight to volume. (4) After 1972, phosphorus loadings were reduced approximately 1.0 g sq m/yr; the reduction is thought to be related to a shift in the zooplankton community from domination by Cyclops to domination by Daphnia. CONSUMPTION OF EELGRASS, ZOSTERA MARINA, BY BIRDS AND INVERTEBRATES DURING THE GROWING SEASON IN LAKE GREVELINGEN (SW NETHERLANDS),
Delta Inst. of Hydrobiological Research, Yerseke (Netherlands).
P. H. Nienhuis, and E. T. Van Ierland.
Netherlands Journal of Sea Research, Vol 12, No 2, p 180-194, November 1978. 3 Fig, 3 Tab, 33 Ref.

Descriptors: *Food chains, *Waterfowl, *Isopods, *Eelgrass, *Coastal marshes, *Lake Grevelingen, Netherlands, Zostera marina, Brackish water, Estuarine environment, Europe, Temperate, Detritus, Aquatic plants, Primary productivity, Temperate, Birds, Foods.

Findings from a study conducted May-August 1976 in Lake Grevelingen, The Netherlands, supported hypotheses developed earlier that in temperate latitudes few animal species use eelgrass (Zostera Marina L.) as a food source; eelgrass yields only a small fraction of its production to grazing food chains and the remainder enters detritus food chains. The plant is found in temperate marine and brackish coastal waters throughout the northern hemisphere, but the Grevelingen eelgrass population is the only significant stand of this plant on the European continental coast from northern France to Denmark. Sampling shows that eelgrass provides quantifiable food amounts to five bird species (Cygnus olor, Branta bernicla, Fulica atra, Aythya ferina and Anas platyrhynchos) and one invertebrate species, the isopod Idotea chelipes. Total eelgrass consumption amounts to 0.839 g C sq m for all of Lake Grevelingen. Birds consume 23% of the total and isopods, 77%. A modest estimate is that only 3.7% of the living eelgrass production (23 g C sq m) in Lake Grevelingen is consumed by birds and Idotea. However, the actual percentage of the eelgrass eaten by these macroconsumers may be slightly larger, about 1.486 g C sq m or 6.5% of the eelgrass production. The remaining 93.5% of living eelgrass production enters the detritus chain. (Harris-Wisconsin)

SPECIES COMPOSITION AND SEASONAL OCCURENCE OF CENTRIC DIATOMS IN A POLLUTED MARINE ENVIRONMENT,
Karachi Univ. (Pakistan). Inst. of Marine Biology.
S. M. Saifullah, and M. Moazzam.
Pakistan Journal of Botany, Vol 10, No 1, p 53-64,

June 1978. 2 Fig, 2 Tab, 26 Ref.

Descriptors: *Karachi, Pakistan, *Diatoms, *Speciation, *Harbors, *Estuarine environments, Bioindicators, Marine microorganisms, Arabian Gulf, Indian Ocean, Lyari River, Karachi(Pakistan), Varieties, Systematics, Chaetoceros, Rhizosolenia, Coscinodiscus, Ports, Coasts, Estuaries, Intertidal areas, Seasonal, Mixing, Distribution, Spatial distribution, Temporal distribution, Lower Harbour(Karachi-Pakistan).

The richness of species diversity among marine centric diatoms in the highly polluted Lower Harbour of Karachi, Pakistan on the Arabian Sea may be accounted for by mixing in the harbor of water from the Lyari River with water from the coastal shelf. In sampling conducted April 1970 - November 1971 and October 1972 - June 1973, 101 species and six varieties belonging to 30 genera were recorded; these results compare with 25 genera, 81 species and nine varieties reported from the Pakistan shelf and the Arabian Sea in an earlier study; difference in total numbers between the two localities is thus negligible. Chaetoceros and Rhizosolenia are the most diverse genera, however, Coscinodiscus, the third most diverse genus, is represented by 13 species in the Lower Harbour but only three species in the coastal shelf. These three genera are also dominant on the west coast of India, but Coscinodiscus ranks second and Rhizosolenia third in species numbers. No relation is established between salinity and auxospore formation. Spatial distribution of diatoms in the Lower Harbour is even more irregular than temporal distribution. In addition to pollution and other environmental perturbations in the Lower Harbour, semidiurnal tides and dredging operations are also considered responsible for irregularity in diatom temporal and spatial distribution. (Harris-Wisconsin)

LIGHT STIMULATION OF PHOSPHATE UPTAKE IN NATURAL ASSEMBLAGES OF PHYTOPLANKTON,
Moss Landing Marine Lab., CA.
S. J. Reshkin, and G. A. Knauer.
Limnology and Oceanography, Vol 24, No 6, p 1121-1124, November 1979. 1 Fig, 1 Tab, 27 Ref.

Descriptors: *Light intensity, *Phytoplankton, *Phosphates, *Michaelis-Menten equations, *Nutrient requirements, Light, Nutrients, Kinetics, Darkness, Algae, Nitrates, Ammonia, Regression analysis, Monterey Bay(CA), Phosphorus, Nitrogen, Ecology.

Dark uptake-corrected light half-saturation constants for surface phytoplankton samples collected offshore Monterey Bay, California range 11.3-18.3% of incident light and are comparable in some instances to those found for light-dependent nitrate and ammonium uptake. Results suggest that phosphate uptake rates can be approximated by Michaelis-Menten rectangular hyperbolic function in terms of percent incident light intensity. However, it is unlikely that uptake rates for nitrogen and phosphorus are similar, since nitrogen is incorporated into phytoplankton tissue at a ratio of 16:1 relative to phosphorus. Half-saturation constants using dark bottles average 4.2% of surface light intensity; dark uptake contributes a significant amount to total uptake rates, ranging 29-33%. When dark uptake rates are subtracted from various light treatments, half-saturation constants are significantly higher, ranging 11.3%-18.3%. These average values are not unexpected; other studies have produced similar results. These observations, together with the importance of phosphorus to primary production, emphasize the ecological importance of phytoplankton being able to assimilate phosphate at relatively low light intensities. (Danovich-Wisconsin)

DISTRIBUTION OF BACTERIA AND CHLOROPHYLL A AT A NEARSHORE STATION IN LAKE ONTARIO,
Canada Centre for Inland Waters, Burlington (Ontario).
S. S. Rao, R. E. Kwiatkowski, and A. A. Jurkovic.
Hydrobiologia, Vol 66, No 1, p 33-39, September 1979. 3 Fig, 4 Tab, 14 Ref.

Descriptors: *Lake Ontario, *Chlorophyll, *Bacteria, *Water temperature, *Organic compounds, Regression analysis, Distribution, Organic matter, Nitrogen, Carbon, Seasonal, Speciation, Biomass, Variability, Depth, Spatial distribution, Temporal distribution, Algae.

Relationships between bacteria and chlorophyll-a seasonal distribution are related to particulate organic carbon (POC), total particulate nitrogen (TPN), and temperature in a nearshore area in Lake Ontario, studied April-November 1977; regression analysis indicates that 45-65% of the total bacterial variability is explained by POC and temperature. A relationship between high chlorophyll-a and low bacteria exists in early spring-September at which time an inverse relationship results. Diatoms are the dominant algal group during summer. In late September bacteria: chlorophyll-a ratio is 50:2 and total bacteria: POC is 35:8. High bacteria - chlorophyll-a ratio peaks in October because of declining temperatures (6C) which result in low chlorophyll-a values but high psychophilic bacterial populations. Regression analysis indicates that chlorophyll-a, POC, TPN and temperature significantly correlate to total bacterial biomass. Chlorophyll-a, POC and TPN highly correlate with one another at all depts. Temperature significantly correlates with POC and TPN only at 1 m depth, but significantly correlates with total bacteria at all depths. Total bacteria significantly correlates with chlorophyll-a and POC at 5 m and 10 m and with TPN at 10 m. Algal community composition (diatom versus non-diatom) also plays an important role in controlling bacterial biomass. (Danovich-Wisconsin)

SEASONAL SUCCESSION OF PHYTOPLANKTON IN A LARGE SUBARCTIC RIVER,
J. W. Moore.
Hydrobiologia, Vol 67, No 2, p 107-112, November 1979. 3 Fig, 19 Ref.

Descriptors: *Yellowknife River(Canada), Northwest Territories, Canada, *Phytoplankton, *Succession, *Subarctic, *Population dynamics, Chlamydomonas, Diatoms, Dinobryon, Light, Light intensity, Nutrients, Water temperature, Seasonal, Limiting factors, Speciation, Dominant organisms, Nitrogen, Phosphorus, Silica.

Seasonal changes in density of common phytoplankton species in the Yellowknife River of subarctic Canada are described; samples were collected every 1-2 weeks June 1975-November 1978. Initiation of the spring bloom in April is due to changing light conditions. Temperatures are constant (0C) and nutrient concentrations are both high and constant. Day length, however, was increasing rapidly (>6 min/d) and coincided with continual reduction in depth of snow and ice cover. Total phosphorus and nitrate levels decrease significantly during May-June, coincident with Chlamydomonas lapponica growth. Chlamydomonas is replaced during early summer by a rapid succession of Dinobryon species in which D. cylindricum is followed by D. sociale and in turn by D. bavaricum and D. divergens. The gradual appearance of diatoms in the river during June coincides with decreased Si02 concentrations. Thereafter, Si02 levels remain low (<0.1 g/cu m) and limit development. Dinobryon species rapidly decrease in August and September. Phytoplankton do not increase in numbers during the fall due to low temperatures and nutrient levels. Nutrient recycling does not occur until late in the season when water temperatures are 0-1C. Yellowknife River is 250 km in length. Samples were collected from the river mouth where water depth is 5-8 m and current velocity is 0-5 cm/s. (Danovich-Wisconsin)

Lake Trafford in southern Florida has higher year-long biomass and tuber density than Jackson and Orange Lakes in northern Florida, 1977, implying that hydrilla control may require more frequent treatments and will be more expensive in southern Florida than in northern Florida. Mats are not present in winter in northern Lakes Jackson and Orange; maximum 0.24 kg dwt/sq m mat biomass occurs in late fall. In southern Lake Trafford, mats are present year round with 0.89 kg dwt/sq m summer biomass maximum. Tuber densities peak in late fall in Lakes Jackson and Orange whereas in Lake Trafford they remain high throughout the year. Dense hydrilla mat structure, as contrasted with open water, substantially changes the aquatic environment. Light levels are reduced below the photosynthetic light compensation point 0.3m below mats, open water light levels are above the compensation point to 1.3 m depths. Hydrilla reduces mixing, allowing daytime temperatures, oxygen concentration and pH to rise to values higher than in open areas. Net hydrilla photosynthesis is lowest during winter, but increases February to May in Orange and Trafford Lakes. Seasonal variation in the C02 compensation point is large (17-90 micro 1 C02/1) for hydrilla in all three lakes. Values are highest in winter and lowest in spring. Such dramatic seasonal shifts in photosynthetic/ photorespiratory metabolism has not been reported with any terrestrial plants, suggesting that submersed aquatic macrophtes are a unique photosynthetic group. COMPOSITION AND ABUNDANCE OF PHYTOPLANKTON IN TRIBUTARIES OF THE LOWER COLORADO RIVER, GRAND CANYON REGION,
Arizona State Univ., Tempe. Dept. of Botany and Microbiology.
W. M. Crayton, and M. R. Sommerfeld.
Hydrobiologia, Vol 66, No 1, p 81-93, September 1979. 2 Fig, 1 Tab, 34 Ref.

Descriptors: *Phytoplankton, *Colorado River, *Grand Canyon(AR-UT), *Baseline studies, *Physicochemical properties, Wild rivers, Rivers, Algae, Speciation, Diatoms, Sampling, Tributaries, Basic data collections, Variability, Intermittent streams, Water sources, Streams, Streamflow.

During April 1975-June 1976, physicochemical characteristeristics were analyzed and phytoplankton samples were collected at mouths of 11 tributaries of the Colorado River within the Grand Canyon. A total of 56 genera and 156 phytoplankton species were identified. Phytoplankton compositions of the tributaries are distinct; only four diatoms are common to all tributaries: Diatoma vulgare, Navicula tripuncata, Nitzschia linearis, and Synedra ulna. Abundance and variability are relatively low in all tributaries; this could reflect physicochemical changes such as the limited age of the water resulting from the short source to mouth distance, and high stream turbidity, sediment content, and current velocity. Bright Angel Creek, Shinumo Creek, and Elves Chasm exhibit the greatest species variability, while Elves Chasm and Diamond Creek have the greatest phytoplankton abundance. Several dominant algal species, Biddulphia laevis, Cocconeis pediculus, Cymbella ventricosa, Epithemia sorex, Gomphonema parvulum and Synedra ulna correlate with certain physicochemical attributes of creek water, such as temperature, pH, TDS, nitrate, calcium and potassium. EFFECTS OF MINE DRAINAGE ON THE RIVER HAYLE, CORNWALL (A) FACTORS AFFECTING CONCENTRATIONS OF COPPER, ZINC AND IRON IN WATER, SEDIMENTS AND DOMINANT INVERTEBRATE FAUNA,
Cambridge Univ. (England). Dept. of Applied Biology.
B. E. Brown.
Hydrobiologia, Vol 52, No 2-3, p 221-233, February, 1977. 7 Fig, 6 Tab, 38 Ref.

Descriptors: *Water quality, *River Hayle(UK), United Kingdom, *Heavy metals, *Mine drainage, *Sediments, *Invertebrates, Cornwall, Mineral industry, Mine water, Copper, Iron, Zinc, Bioaccumulation, Benthic fauna, Environmental effects, Speciation, Biomass, Seasonal, Diptera, Larvae, Aquatic insects.

This paper describes heavy metal levels in waters, sediments and invertebrate fauna of the River Hayle, situated in the Cornwall mining district, Great Britain, 1973. Several species of Trichoptera, Odonata, Plecoptera and Diptera larvae and adult Coleoptera are present at sites above and below mining influence; however, Mollusca, Hirudinea, Oligochaeta, Crustacea and Platyhelminthes numbers are reduced at downstream sites polluted by mine drainage entry, very few invertebrate species occur. Species diversity is also reduced in the lower river. Highest metal levels are recorded in free-living Trichoptera larvae followed by Plecoptera, Odonata, Neuroptera larvae and finally adult Coleoptera. Water analysis results show that iron is the most abundant metal reaching 6 mg/l, followed by zinc (2.4 mg/l maximum) and then copper (0.7 mg/l maximum). 70% of all copper and iron is particulate whereas 80% of all zinc is soluble. Seasonal differences in total metal content suggest that metal concentrations increase during high flow and decrease during low flow. In sediments iron is the most abundant metal, followed by copper and then zinc. Copper concentrations exceed zinc in sediments probably because clay has a greater affinity for heavier divalent cations. Sediment copper concentrations increase markedly in summer. Ratios of available to total metal present in sediments show that the sequence of exchangeable metals is Zn > Cu > Fe. (Danovich-Wisconsin)

ORGANOCHLORINE INSECTICIDES AND PCBS IN SEDIMENTS OF LAKE ST. CLAIR (1970 AND 1974) AND LAKE ERIE (1971),
Ontario Ministry of Agriculture and Food, Guelph. Pesticide Residue Lab.
R. Frank, M. Holdrinet, H. E. Braun, R. L. Thomas, and A. L. W. Kemp.
The Science of the Total Environment, Vol 8, p 205-227, 1977. 8 Fig, 6 Tab, 24 Ref.

Descriptors: *Sediments, *Lake St. Claire, *Lake Erie, *Insecticides, Great Lakes, Polychlorinated byphenyls, Pollutants, Organochlorine compounds, Chlorinated hydrocarbon pesticides, Organic pesticides, DDT, DDE, DDD, Pesticide residues, Water pollution sources, Distribution, Detroit River, Aldrin, Spatial distribution, Path of pollutants.

Insecticide residues are usually highest in sediments from Lake Erie's western basin and lowest in Lake St. Claire. Mean residue values in Lake St. Claire surface sediment also decreased significantly 1970-1974. In 1970, mean DDT residue was 6.6 ppb and by 1974, residues declined to 2.4 ppb. TDE was the major component of DDT residues (> 50%), followed by DDE (30%). In 1970, mean HEOD residue in Lake St. Claire was 0.1 ppb and only 24% of samples contained detectable residues. Mean PCB residues were 19 ppb in 1970 and 10 ppb in 1974. Residue spatial distribution in Lake Erie sediments show higher concentrations in basin deposits near the Detroit River and Western Basin. HEOD levels in suspended solids were 3.6 ppb in the Detroit River compared to 1.2 ppb in Lake Erie. PCBs in suspended solids of the Detroit River were 72 ppb but ranged 30-100 ppb; Lake Erie mean PCB residue was 95 ppb. Mean DDT residue in Detroit River suspended solids was 18.5 ppb; mean DDT residue in Lake Erie was 27.9 ppb. In Lake Erie, TDE was the predeominant DDT component with 18.4 ppb mean residue and values ranged 0.3-186 ppb. DDE averaged 8.2 ppb and ranged 0.2-136 ppb. Lake Erie DDT mean residues in the Western Basin were 70.3 ppb, in Sandusky Basin, 15.9 ppb and in the Eastern Basin, 30.4 ppb. With 7.6 mm/yr sedimentation rate, DDT first appeared in 1958, HEOD in 1953 and PCB in 1956; data are compatible with known usage patterns, indicating a 2-5 year lag period after widespread use began. EFFECTS OF OIL ON MARINE PHYTOPLANKTON COMMUNITIES,
Alaska Univ., Fairbanks. Inst. of Marine Science.
V. Alexander, T. Chapman, and R. A. Neve.
In: 'Alaska Fisheries: 200 Years and 200 Miles of Change', Alaska University Sea Grant Report 79-6, p 263-279, August 1979. 6 Fig, 4 Tab, 9 Ref. Proc of 29th Alaska Science Conference, held Fairbanks, Alaska 15-17 August 1978.

Descriptors: *Oil pollution, *Water pollution effects, *Phytoplankton, *Environmental effects, Baseline studies, Ecosystems, Resources development, *Outer Continental Shelf, Petroleum hydrocarbons.

A series of experiments was conducted at the Seward Marine Station of the Institute of Marine Science, University of Alaska, to determine the effects of low concentrations of petroleum hydrocarbons on marine phytoplankton. The aim was to simulate a natural bloom by using open air swimming pools with flow-through of deep nutrient-rich water pumped from Resurrection Bay and exposed to natural light. Oil was introduced in the inflow of two of three pools at rates designed to produce concentrations of 10 to 50 ppm, while a third pool remained uncontaminated as a control. Observations were designed to detect differences in photosynthesis and phytoplankton population composition between the control and oil impacted pools. Experiments were run over ten day periods. Apart from some minor suppression of photosynthesis, there were no significant changes in phytoplankton activity or population composition. The effects were considered insignificant in terms of overall ecosystem impact. This is in contrast with findings from short-term bioassay experiments in small volume containers. In general, the results support the conclusion that effects of oil spills on pelagic phytoplankton populations are likely to be trivial. (Sinha-OEIS)

AN OVERVIEW OF OFFSHORE ENVIRONMENTAL POLLUTION LAWS AND REGULATIONS IN CANADA, GREENLAND, AND THE NORTH SEA,
Alaska Univ., Fairbanks. Geophysical Inst.
W. M. Sackinger.
In: 'Alaska Fisheries: 200 Years and 200 Miles of Change', Alaska University Sea Grant Report 79-6, p 577-591, August 1979. 88 Ref, Proc of 29th Alaska Science Conference, held Fairbanks, Alaska, 15-17 August 1978.

Descriptors: *Oil pollution, *Legislation, *Regulation, *Arctic, *Water pollution, Canada, Alaska, Resources development, Environmental effects, Monitoring, *Outer Continental Shelf, Greenland, North Sea.

The search for offshore petroleum deposits in Arctic and sub-Arctic waters around the world has led many nations to review their legislation dealing with oil pollution incidents at sea. In some cases, legislation originally intended to deal with tanker spills and ballast discharge has been supplemented with specific measures directed at offshore drilling and production operations. Some nations have promulgated regulations which are very specific, while others have managed offshore activities by allowing administrative exceptions to very general rules, based upon an operator's proposed work plan. A brief review of pertinent provisions in the international law covering oil discharges at sea is given, followed by an outline of the framework of environmental pollution law and regulations in Canada, Greenland, and the North Sea. The governmental structure and political terms of reference within which these laws and regulations are enforced is described. Finally, some implications of these findings for the developing Alaskan Outer Continental Shelf, are included. (Sinha-OEIS)
W80-03896

THE TRANSFER OF CADMIUM FROM MARINE HETEROTROPHIC BACTERIA TO MACOMA BALTHICA,
Alaska Univ., Fairbanks. Inst. of Marine Science.
D. L. Weihs, and D. C. Burrell.
In: 'Alaska Fisheries: 200 Years and 200 Miles of Change', Alaska University Sea Grant Report 79-6, p 609-615, August 1979. 2 Fig, 1 Tab, 33 Ref.

Proc of 29th Alaska Science Conference, held Fairbanks, Alaska, 15-17 August 1978.

Descriptors: *Water pollution effects, *Cadmium, *Bacteria, *Food chains, *Environmental effects, Baseline studies, Resources development, Clams, Oil pollution, Metals, *Outer Continental Shelf, Macoma balthica.

A major portion of the renewable resources of Alaska is dependent upon clams. Apart from being themselves exploitable, clams appear to be a major food source for the commercial crabs (and also for important marine mammal species). Such trophic relationships provide relatively direct links from the sediments, which are the major repository for the potentially pollutant chemicals, to man. Marine bacteria, colonizing on the sediments and in interstial water, provide substantial nutrition for deposit feeders e.g., Macoma balthica and chemical recycling for inorganic and organic compounds. The uptake of one highly toxic metal (cadmium) by a marine heterotrophic bacterial population was found to exceed a concentration factor of 10,000. The bacteria in this situation seem to be an important mechanism for the bio-accumulation of cadmium in sediments and in organisms linked to the bacteria-sediment food chain. When cadmium-enriched bacteria were used as the sole food for the deposit feeding clam M. balthica (common to Alaskan intertidal environments), the clams also showed enrichment of the metal over the controls. The transfer efficiency in this aquaria ingestion experiment was close to one and depuration appeared to be relatively rapid. The significance of these data to the fisheries and potential pollution in Alaskan waters is discussed. (Sinha-OEIS)
W80-03897

SOURCES AND CHARACTERISTICS OF LIQUID PROCESS WASTES FROM ARCTIC OFFSHORE HYDROCARBON EXPLORATION,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
S. E. Hrudey.
Arctic, Vol 32, No 1, p 3-21, March 1979. 2 Fig, 4 Tab, 17 Ref.

Descriptors: *Water pollution, *Arctic, *Exploration, *Liquid wastes, Resources development, Environmental effects, Monitoring, Drilling fluids, Oil pollution, *Outer Continental Shelf, Hydrocarbons.

Increased interest in offshore hydrocarbon exploration in Arctic waters raises concern regarding liquid waste management from drilling operations. The typical sources of process liquid waste from exploratory drilling operations is described and data on the quantity and quality of liquid waste discharges is provided from monitoring at two offshore sites. The chemical and toxicological characteristics of the waste fluids indicate that a potential exists for water pollution in specific circumstances. However, close process control to reduce the quantities of waste fluid generated and judicious selection of drilling mud additives should prevent the occurence of significant water pollution problems from waste fluid disposal at exploratory Arctic offshore drilling operations. INCORPORATION, DISTRIBUTION AND FATE OF SATURATED PETROLEUM HYDROCARBONS IN SEDIMENTS FROM A CONTROLLED MARINE ECOSYSTEM,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
T. L. Wade, and J. G. Quinn.
Marine Environmental Research, Vol 3, No 1, p 15-33, January-March 1980. 5 Fig, 5 Tab, 27 Ref.

Descriptors: *Oil pollution, *Sediments, *Estuaries, *Ecosystems, Baseline studies, Water pollution effects, Environmental effects, *Outer Continental Shelf, Petroleum hydrocarbons.

A simulation of a chronic input of petroleum into an estuarine environment was investigated using the facilities at the Marine Ecosystems Research Laboratory at the University of Rhode Island. An oil-water dispersion of No. 2 fuel oil was added to the system (twice weekly for 24 weeks) and the saturated hydrocarbons from this oil were measured in suspended material and sediments. After the initial chronic oil addition, trace amounts of hydrocarbons were detected in the sediments within two weeks, but substantial accumulation was not detected for approximately 135 days. The oil appeared to enter the sediment via the suspended material, with most of the saturated hydrocarbons associated with smaller size sediment particles. With time, the fuel oil saturated hydrocarbons in the sediments were mixed to a depth of 3 to 4 cm. Although only 12% of the total saturated hydrocarbons added to the system were found in the sediments, these hydrocarbons appear to be relatively stable and were still detectable in these sediments for at least six months after the last oil addition. STEROLS IN NATURAL WATER AND SEDIMENT,
Texas University at Dallas, Richardson. Center for Environmental Studies.
J. P. Hassett, Jr., and G. F. Lee.
Water Research, Vol 11, No 11, p 983-989, 1977. 5 Fig, 3 Tab, 24 Ref. EPA 5T2-WP.

Descriptors: *Organic compounds, *Lake Mendota(WI), *Torch Lake(MI), *Sediments, *Water chemistry, *Lake Wingra(WI), Water analysis, Gas chromatography, Chemical reactions, Biochemistry, Sewage effluents, Organic matter, Water pollution sources, Sewage, Sewage disposal, Sedimentation, Chemistry, Runoff, Wisconsin, Michigan.

C-27, C-28 and C-29 sterols were present in sediments of lakes Mendota and Wingra, Wisconsin, and Torch Lake, Michigan, January and May, 1973. In Lake Mendota sediments, both saturated and unsaturated sterols were present, but this distinction was not made for lakes Wingra and Torch sediments. Saturated sterols indicate that sterols are being reduced; since the degree of saturation is greater in free sterols than in sterol esters, ester hydrolysis may occur more rapidly than reduction of double bonds. In Lake Mendota sediments, ester sterols account for 10% of total sterol content. Fecal sterol coprostanol is present in all samples, indicating that organic compounds from sewage are accumulating in these sediments. Sterol concentrations in Lakes Mendota and Torch water are 1000 times less than dry weight concentrations in Torch Lake sediments; therefore, sterols are accumulating in sediments. Sterol concentrations are 0.8 micro g cholestrol/l and 3 micro g beta-sitosterol/l in Lake Mindota water and 0.7 micro g cholestrol/l and 2 micro g beta-sitosterol/l in Torch Lake water. Minimum concentration in Torch Lake sediment is 3 ppm sterols on a dry weight basis. Exact identity and origin of sterols in these lakes is unknown. Algae and terrestrial runoff probably contribute most sterols; however, it is not known which source is more important. Torch Lake has received large amounts of copper mine tailings and is receiving sewage effluent. Lakes Wingra and Mendota both receive storm water drainage; Lake Mendota also receives agricultural drainage. (Danovich-Wisconsin)

5D. Waste Treatment Processes

NITRIFICATION-DENITRIFICATION OF WASTEWATER,
Union Carbide Corp., NY. (Assignee).
L. C. Matsch, and R. F. Drnevich.
U.S. Patent No 4,173,531, 15 p, 6 Fig, 6 Tab, 11 Ref; Official Gazette of the United States Patent Office, Vol 988, No 1, p 175, November 6, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Biological treatment, Sewage treatment, Activated sludge, Oxygenation, Nitrification, Denitrification, Bacteria.

This invention is practiced in the activated sludge-type system in which wastewater containing nitrogenous compounds is mixed in an oxidation zone in the presence of carbonaceous compounds with oxygen-containing gas and activated sludge containing carbon-consuming and nitrogen-oxidizing bacteria for sufficient duration to nitrify the nitrogenous compounds and form nitrified oxygenated mixed liquor which is discharged from the oxidation zone and passed to a separate zone to effect concentration of solids from liquor with at least a major part of the concentrated solids being returned to the oxidation zone as activated sludge such that the total residence time of solids (SRT) is at least two days. More specifically nitrified oxygenated liquid-solid is withdrawn to a zone in which the dissolved oxygen concentration in the liquid or liquor is below about 0.3 mg/l and preferably below about 0.2 mg/l such that nitrate and nitrate compounds are reduced to gases such as elemental nitrogen and nitrous oxide by heterotrophic denitrifying bacteria. (Sinha-OEIS)
W80-03610

METHOD FOR REMOVING SUSPENDED OIL DROPLETS FROM WATER,
Exxon Production Research Co., Houston, TX. (Assignee).
R. E. Williams.
U.S. Patent No 4,173,533, 6 p, 1 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 988, No 1, p 176, November 6, 1979.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Oil pollution, *Separation techniques, Bubbles, Oily water, Oil wastes, Offshore platforms, Equipment, Coalescence.

Suspended droplets of oil are separated from a waste water stream by the method and apparatus of this invention. The oil and water mixture is injected into a partially submerged, vertical pipe. Gas bubbles injected into the lower end of the pipe, rise through the pipe and counter-currently contact the suspended oil droplets, thereby promoting the separation of the droplets from the waste water. The oil droplets coalesce and form a separate oil layer on top of the waste water which is readily withdrawn while clarified waste water is discharged from the lower end of the pipe. If employed to separate oil from a waste water stream on an offshore rig, the vertical pipe is submerged adjacent to the rig. (Sinha-OEIS)

DISINFECTION/TREATMENT OF COMBINED SEWER OVERFLOWS, SYRACUSE, NEW YORK,
O'Brien and Gere Engineers, Inc., Syracuse, NY.
F. J. Drehwing, A. J. Oliver, D. A. MacArthur, and P. E. Moffa.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-113459, Price codes: A12 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-134, August 1979. 260 p, 95 Fig, 64 Tab, 107 Ref, 7 Append. S802400(11020HFR).

Descriptors: *Combined sewers, *Storm runoff, *Waste water treatment, *Disinfection, Chlorination, Screens, Regression analysis, Mathematical models, Sewers, Sewage bacteria, Suspended solids, New York, Cost analysis, Operating costs, Water pollution sources, *Syracuse(NY).

The treatment of combined sewer overflows (CSO) at the point of overflow with the use of high-rate treatment techniques was studied at the Onondaga County Department of Drainage and Sanitation in Syracuse, New York. The high-rate techniques tested included three fine-mesh microscreening devices, and a swirl regulator/concentrator followed by disinfection by chlorine (C12) and chlorine dioxide (C102). During 1974 through 1976, 16 overflow events were monitored for the screening devices and 11 events were monitored for the swirl unit. The three microscreening units were a Sweco Wastewater Concentrator, a Zurn Micromatic, and a Crane Microstrainer with screen aperatures of 105 microns, 71 microns, and

3 microns respectively. Multiple regression analys was used to develop mathematical performance odels for the three screening devices and for the wirl regulator/concentrator relating suspended olids (SS) removal to influent hydraulic loading nd influent SS concentrations. Statistically signifiant performance equations were developed for he C12 and C102 disinfection systems using multile regression modeling. Results show that applicaion of high-rate disinfection processes can result in ignificant reduction of bacterial concentrations in SO. Also, the removal of SS improved this reuction of bacteria concentrations with the improvement being slightly more pronounced for C102 than for C12 disinfection. C12 disinfection, owever, has the lower capital and operating osts. Special situation studies are also reported on irus inactivation, bench-scale ultraviolet light disnfection, on-line monitoring of SS, continuous monitoring of total organic carbon and chlorinated ydrocarbon analyses. (Seigler-IPA)

SCREENING/FLOTATION TREATMENT OF COMBINED SEWER OVERFLOWS, VOLUME II: FULL-SCALE OPERATION RACINE, WISCONSIN,
Envirex Inc., Milwaukee, WI. Environmental Sciences Div.
T. L. Meinholz, D. A. Gruber, R. A. Race, C. A. Hansen, and J. H. Moser.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-130693, Price codes: A17 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-106a, August 1979. 374 p, 130 Fig, 120 Tab, 11 Ref. S800744.

Descriptors: *Combined sewers, *Storm drains, *Waste water treatment, *Storm runoff, Water pollution sources, Mathematical models, Overflow, Dissolved oxygen, Biochemical oxygen demand, Wisconsin, Coliforms, Phosphorus, Flotation, Screening, *Racine(Wis).

Three full-scale demonstration 'satellite plants' for combined sewer overflow treatment were planned, designed, constructed, operated, and monitored over a two-year period to evaluate their effectiveness as alternatives to combines sewer separation. The plants are located in Racine, Wisconsin, at major points of combined sewer overflow to the Root River. Two of the 'satellite plants' use screening/dissolved-air flotation treatment prior to overflow discharge and have a combined capacity of 22,000 cu m/day. The third plant with a capacity of 14,800 cu m/day used only screening. Permanent automatic samplers were used to collect samples of influent, screened effluent, and final effluent. These samples were analyzed for dissolved and total biochemical oxygen demand (BOD); dissolved and total organic a carbon; total, suspended (SS), and suspended volatile solids; total phosphorus; fecal coliforms; pH; and chlorine residual. Specific runs were analyzed for pesticides, particle size, the nitrogen series, chloride, and fecal streptococci. Results show that the 'satellite plants' are feasible alternatives to sewer separation. Removal efficiencies of 60 to 75% were recorded for SS and 50 to 65% for BOD. The screening method removed 50% SS and 20% BOD. Operation of the systems had a beneficial effect on the receiving waters of the Root River. Data from this area and study were also used to verify and modify the Storm Water Management Model. (Seigler-IPA)
W80-03652

COMPARISON OF OZONE CONTACTORS FOR MUNICIPAL WASTEWATER EFFLUENT DISINFECTION -- PACKED COLUMN VERSUS JET SCRUBBER,
Municipal Environmental Research Lab., Cincinnati, OH. Wastewater Research Div.
A. D. Venosa, E. J. Opatken, and M. C. Meckes.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-118789, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-098, August 1979. 92 p, 24 Fig, 40 Tab, 19 Ref, 3 Append.

Descriptors: *Ozone, *Disinfection, *Waste water treatment, Coliforms, Biochemical oxygen demand, Turbidity, Ammonia, Nitrogen compounds, Regression analysis, Suspended solids, Organic wastes, Effluents, Sewage effluents, Chlorination, Aquatic microorganisms.

The engineering and microbial parameters affecting waste water disinfection by ozonation were studied for two types of ozone contactors. The contactors tested, a jet scrubber and a packed column, were compared for ozone utilization and coliform reduction efficiency. Each contactor had a nominal design flow capacity of 75 1/min of secondary effluent. Three operation phases were used: (1) batch operation -- both contactors operated separately under identical conditions, (2) parallel operation -- both contactors operated in parallel on the same effluent, and (3) continuous operation -- both contactors operated in parallel for a three log reduction of coliforms in the same effluent. Samples were collected both before and after ozonation and were analyzed for total and fecal coliforms, temperature, chemical oxygen demand, turbidity, total organic carbon, suspended solids, ammonium nitrogen, nitrate nitrogen, nitrite nitrogen, pH, total Kjeldahl nitrogen, and others. Ozone residual was determined by amperometric techniques. Regression analysis was used to determine which factors in the effluent contributed to variations in microorganism reduction and mass transfer efficiency. Results show that a jet scrubber type contactor is not efficient for ozone disinfection primarily due to the lack of sufficient residual levels produced. The performance of both contactors was dependent on waste water effluent quality with chemical oxygen demand and organic carbon as major controlling factors. The packed column was superior to the jet scrubber in ozone utilization with the difference increasing with increasing ozone dosage. (Seigler-IPA)
W80-03653

COMBINED SEWER OVERFLOW TREATMENT BY SCREENING AND TERMINAL PONDING -- FORT WAYNE, INDIANA,
Howard, Needles, Tammen, and Bergendoff. Indianapolis, IN.
D. H. Prah, and P. L. Brunner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-11939, Price codes: A07 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-085, August 1979. 137 p, 54 Fig, 30 Tab, 5 Ref. 11020 GYU.

Descriptors: *Combined sewers, *Overflow, *Ponding, *Storm drains, *Screens, Storm water, Sewers, Sewage treatment, Sewage lagoons, Water quality, Chlorination, Water pollution, Nutrients, Chemical oxygen demand, Costs analysis, Biochemical oxygen demand, Coliforms, Indiana, Fort Wayne(Ind).

The Fort Wayne Stormwater Treatment Evaluation Project, a 75 MGD plant, was constructed in 1973-74 to study the effectiveness and costs of screening combined sewer overflows (CSO). Three types of screening techniques were tested: fixed side hill vertical screens, rotary centrifugal fine screening, and horizontal rotary drum fine screening. The benefits to receiving water by the pollutant removal effects of these screening techniques were quantified. Thirty-eight stormwater treatment events were studied. Grab samples were taken and analyzed for 14 water quality parameters including pH, temperature, settleable solids, and fecal coliforms. Results show that at the 95% confidence level, removal efficiencies for suspended solids, five-bay biochemical oxygen demand, chemical oxygen demand, and nutrients were not significantly different from zero for the screening methods tested. Also, no relationship between removal efficiency and hydraulic loading was observed. The fixed vertical-type screen had the least overall cost at $25.25/MG. Hydraulic head requirements for all screens were in the order of 2 to 10 feet static loss. A 32-acre terminal pond was capable of meeting secondary effluent standards 95% of the time even with the addition of storm-caused combined sewer overflows. Overall the treatment plant reduced the bypassing of raw untreated CSO by 82% which resulted in improvements in quality of the receiving waters. (Seigler-IPA)
W80-03656

LEVEL III: RECEIVING WATER QUALITY MODELING FOR URBAN STORMWATER MANAGEMENT,
Duke Univ., Durham, NC. Dept. of Civil Engineering.
M. A. Medina.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-134406, Price codes: A10 in paper copy, A01 in microfiche. Environmental Protection Technology Series Report No EPA-600/2-79-100, August 1979. 215 p, 30 Fig, 17 Tab, 39 Ref, 2 Append.

Descriptors: *Mathematical models, *Combined sewers, *Urban runoff, *Waste water treatment, Water pollution sources, Hydrologic aspects, Computer models, Computer programs, Iowa, Dissolved oxygen, Sewage treatment, Runoff, Surface runoff, Rainfall-runoff relationships.

The development, operation, and application of a simplified continuous receiving water quality model, Level III-Receiving, are described. The model is designed to permit preliminary planning and screening of areawide urban waste water treatment alternatives for the major parameters of frequency of water quality violations and dissolved oxygen concentrations. The model can simulate the response of a stream or tidal system to the effects of waste input from upstream sources, dry weather urban sources, and wet weather urban sources. These simulations can be made for inputs from separate or combined sources. By identifying a minimum interevent time the total hours of runoff in a year are divided into storm events. Dissolved oxygen concentrations are estimated as a function of hydrodynamic and biochemical parameters. The model can be interfaced with the Hydrologic Engineering Center model, STORM, and with the continuous version of the Storm Water Management Model (SWMM). The model is not applicable to systems requiring multidimensional transient analysis and complex conditions such as eutrophication and sedimentation are not accounted for. The model was applied to the Des Moines River at Des Moines, Iowa, and results are given. Also included are STORM input data and load module job control language and a program listing. (Seigler-IPA)

THE EFFECT OF PHOSPHATE AND TEMPERATURE ON GROWTH OF ACTIVATED SLUDGE AND ON BIODEGRADATION OF SURFACTANTS,
Water Pollution Research Lab., Stevenage (England).
H. A. Painter, and E. F. King.
Water Research, Vol 12, No 11, p 909-915, 1978, 2 Fig, 5 Tab, 10 Ref.

Descriptors: *Temperature, *Surfactants, *Activated sludge, *Phosphorus, *Waste water treatment, *Sewage sludge, *Peptone, Phosphates, Biodegradation, Sewage, Water treatment, Sludge treatment, Lime, Sludge, Growth rates, Sewage treatment, Testing procedures, Chemical oxygen demand, Biochemical oxygen demand, Flocculation, Sewage bacteria, Bacteria.

Peptone phosphorus content variability causes most poor growth rates of non-flocculent sludge, leading to erratic and falsely low removal degrees of both chemical oxygen demand (COD) and added surfactants. Adequate phosphorus must be present in OECD/EEC synthetic sewage for proper qualitative and quantitative sludge growth and valid measurements of added surfactant removal. Phosphorus concentrations must be 2-5 mg/l in the sewage with 230-300 mg/l COD, 150-200 mg/l BOD and 98-136 mg/l TOC. Lack of phosphate also causes trouble in both units; because sludge grows in a dispersed, non-flocculent form which frequently blocks pores in WRC units, settles poorly, and causes solid losses in Husmann units. Generally, phosphorus-deficient sludges posses few bacteria types, very few attached ciliated protozoa, and no crawling ciliates. Of synthetic sewage constitutents, only peptone and meat extracts are likely to contain sufficient phosphorus to supply nutrient needs of sludge microorganisms. Addition of 5 mg P/l is recommended to ensure against phosphorus deficiency. Concentrations of 8 mg P/l give results significantly similar to those obtained with 2-3 mg P/l. Low temperatures (10C) do not affect normal sludge growth or floc formulation; the over riding factor is adequate phosphorus. Similarly, removal degrees of alkylbenzene sulphonates JNQ and TBS, and of alcohol ethoxylate, are only slightly depressed at 10C compared with those at 20C: larger effects are observed at both temperatures while phosphorus is limited. Descriptors: *Ozone, *Water treatment, *Disinfection, *Water purification, Enteric bacteria, E. coli, Viruses, Microbiology, Turbidity, Particle size, Bentonite, Water pollution, Flocculation, Environmental engineering, Potable water.

Enteric bacteria and viruses adsorbed or incorporated into fecal material, HEp-2 cells, aluminum oxide floc and bentonite clay were subjected to ozone disinfection to determine the effect of particulates on disinfection efficiency. The organisms tested were fecal coliforms, poliovirus (Sabin Type 1), Coxsackievirus A9, porcine picornavirus type 3 (Strain ECPO-6), and f(2) bacteriophage. Particulates were tested at concentrations of 1 or 5 Nephelometric Turbidity Units. Results show that some of the test organisms were protected to differing degrees by the particulates and that the normal ozone disinfection procedures used for free organisms were not sufficient. Cell-associated poliovirus and Coxsackievirus were most protected by HEp-2 cells. Concentrations of 5.33 to 4.81 mg/l ozone were required to inactivate the cell-associated Coxsackievirus in 5 to 0 minutes. Escherichia coli, poliovirus and Coxsackievirus associated with hydrated aluminum oxide floc and bentonite clay showed little or no increased resistance to disinfection. The f(2) bacteriophage was somewhat protected by bentonite clay particles. A continuous flow disinfection apparatus was used for the tests with a bath reactor for continuous ozonation. Ozone concentrations were measured according to a slightly modified method of Schechter. (Seigler-IPA)
